The Penicillin-Syphilis Group at the University of Pennsylvania has treated 746 patients with penicillin since Nov 11, 1943 Of these, 283 had neurosyphilis The average period of observation is 357 days, the longest period of observation being 719 days One hundred and nineteen had been observed from 120 to 364 days, 55 for 365 to 599 days and 23 for 600 days and over Thanks to the follow-up workers of the Institute for the Control of Syphilis, 97 7 per cent of these patients have been kept track of and returned for periodic observation and treatment The material is classified by diagnosis and initial spinal fluid findings in table 1 The patients with negative spinal fluids at the outset showed symptoms against which response could be measured

## POINTS DESERVING EMPHASIS IN THIS MATERIAL

In order to be considered for penicillin treatment, the patient must have presented some symptom, sign or serologic finding that would serve as a measuring stick for improvement or failure Treatment was confined to penicillin, no adjuvants, supplements or adjuncts were employed if penicillin results did not meet expectations except, through error, in 1 case of juvenile dementia paralytica Treatment of various kinds before penicillin had, however, been employed in 128 cases but none after penicillin was once begun Moreover, no patient had had fever within a year preceding the use of penicillin, but a number of patients had been receiving routine nonintensive treatment with arsenicals and bismuth up to within one month of their first penicillin course

We have had the advantage, indispensable, we believe, to effective work in neurosyphilis, of uniformity of serologic technic and evaluation [1] Laboratory and technical disparities when reports come from differing sources, or changing technicians, are a leading difficulty in therapeutic as in diagnostic interpretation The neurosyphilis material has also had the advantage on the clinical side of group and specialist evaluation of progress and status

## SOME DEFECTS OF THE MATERIAL

The lack of a preplanned dosage system was not made good until after the second deadline report [2] in October 1944 Of 113 cases now managed by preplanned systems, only 61 have been observed for 120 days or more and will therefore be subsequently reported on

A more or less unavoidable defect when the patient's recovery is at stake in the treatment experiment is the tendency to prolong treatment and increase the individual course and total dosage in patients who are refractory or respond slowly This obscures the effect of lower dosage and of prolongation of treatment as such Lack of a clearly defined and consistent terminology makes the problem of quantitative appraisal of both serologic and clinical improvement difficult To conserve space certain of the diagnostic and treatment progress codes developed are here omitted but will be available to inquirers on request

## DRUG AND METHODS OF USE

Sodium penicillin from different manufacturers was used throughout When possible but not invariably, each patient received the product of a single manufacturer Since March 1944 all schedules have been three hour interval, round-the-clock intramuscular injection, using isotonic solution of sodium chloride, usually 20,000 units per cubic centimeter We emphasize skilled handling and injection technic, and no local anesthetic is necessary We have no significant local reactions Penicillin solutions were not kept longer than twenty-four hours in the icebox, were protected from air and light and were administered ice cold to the patient

## DECISIONS ON RETREATMENT

Decisions as to retreatment are based on 1 Failure of the spinal fluid to become normal The Dattner-Thomas type of residual abnormality was subjected to retreatment to try to secure a completely negative formula

The investigation was assisted by contributions from the Gar Wood Research Fund and the Kirby McCarthy Fund

The work described in this paper was done under a contract recommended by the Committee on Medical Research between the Office of Scientific Research and Development and the University of Pennsylvania

From the Institute for the Control of Syphilis University of Pennsylvania and United States Public Health Service cooperating and the Penicillin Syphilis Panel of the University Hospital The Institute the Departments of Neurology Ophthalmology Dermatology and Syphilology and Pediatrics and the Division of Venereal Disease Control Philadelphia City Department of Public Health and the Philadelphia General Pennsylvania and Children s hospitals are represented in the authorship

1 The technical head of the laboratory Mrs Verna Mayer Stein, who has held the post for seventeen years and who has performed and read all tests has passed successfully all state and national evaluation tests of her work We have come to recognize and trust her results down to decimals so to speak The tremendous advantage of such a setup cannot be overemphasized

2 Stokes J H Beerman H Ingraham N R Jr Lentz J W Morgan H G Gammon G D Steele W H Rose E K and Gyorgy Paul Penicillin in Late Syphilis Am J Syph Gonor & Ven Dis. 29 313 333 (May) 1945

Normal and "near normal" formulas are defined in table 2. 2 Relapse in the spinal fluid formula of any degree 3 Failure of symptoms to respond completely (does not include ordinarily unresponsive objective signs) 4 Relapse of symptoms Some patients who became worse when the change was regarded as "progression" rather than secondary degeneration, were treated further with penicillin for good measure Some patients who obtained negative spinal fluids and especially 'near normal' were retreated to "hold the result"

TABLE 1.—*Classification of 197 Cases of Neurosyphilis Observed over 120 Days*

| | Abnormal Cerebrospinal Fluid | Negative Cerebrospinal Fluid |
|---|---|---|
| Dementia paralytica | 16 | 1 |
| Dementia paralytica with tabes | 20 | 2 |
| Tabes dorsalis * | 31 | 12 |
| Meningovascular neurosyphilis | 33 | 1 |
| Congenital neurosyphilis | 10 | 5 |
| Other neurosyphilis * | 9 | 1 |
| Asymptomatic neurosyphilis | 30 | 0 |

* One diagnosed as primary optic atrophy occurred in the tabetic series

The typing of spinal fluid formulas (types 1, 2 and 3) now standard in the literature [3] was employed in the nomenclature In connection with the concept of "normal versus near normal" (table 2) we have adopted a term indicative of very slight abnormality so slight as to be ordinarily within common conceptions of the negative, in order to express the idea that the fluid has been abnormal and may ultimately have meaning for relapse or progression or the need for fluid reexamination in cases in which the spinal fluids are known to have been definitely abnormal

### SPINAL FLUID RESPONSE TO PENICILLIN

The to us most convincing portrayal in our material of the effectiveness of penicillin in dealing with spinal fluid abnormality in neurosyphilis, is given in chart 1 It seems clear that in the 39 cases of our original series the trend toward improvement under penicillin has been consistent, prolonged and progressive and occurs in an increasing proportion of the cases over the time period involved In our report [4] of May 1944 2 6 per cent (1 in 39 cases) had reached normal In October 1944, five months later, 26 per cent or one fourth had reached normal or 'near normal' 'Striking improvement" (grades 3 and 4) stands at 56 per cent 33 per cent and 18 per cent at the successive evaluation dates, the gain in negative fluids being made by conversion of striking improvement into normality In November 1945, thirteen months later, 62 per cent had become normal or near normal While some of this good effect is doubtless the result of cumulative dosage, time and repeated courses, there is much here and elsewhere in this study to suggest that progress after penicillin is continuous and cumulative after a single course, as after fever therapy The best effects cannot be seen short of months

TABLE 2.—*Cerebrospinal Fluid Improvement Code*

| | |
|---|---|
| | Grade 00—Worse in one or more items of cerebrospinal fluid examination |
| | Grade 0—No change |
| Slight improvement | Grade 1—Drop in cells or protein |
| | Grade 2—Drop in both cells and protein |
| Striking improvement | Grade 3—Drop in cells protein quantitative Wassermann reaction or colloidal mastic curve |
| | Grade 4—Drop in all four items of fluid examination |
| | Near normal—Cells 5-10 protein 30-40 mg. 1111000000 colloidal mastic curve |
| | Normal—Cells 4 or less protein 10-30 mg. 1110000000 colloidal mastic curve |
| | DT (Dattner Thomas inactive formula)—Cells 4 or less protein 0 mg. or less regardless of Wassermann reaction and colloidal curve persisting six months or more |

Our study of spinal fluid response to penicillin in 175 cases with initially normal fluids (table omitted) shows that 63 of 175 cases or 36 per cent, achieved normal or near normal spinal fluids, and 129 of 175, or 74 per cent, made striking improvement By way of contrast in our first evaluation in May 1944, of 107 cases from various sources 1, or 0 9 per cent, had achieved normal fluid and only 35, or 33 6 per cent, made definite improvement It seems a not unreasonable conclusion that, the longer patients are treated and observed, the better the results

Studied by diagnostic categories our 175 cases show for dementia paralytica 10 out of 16, or 62 per cent, definitely improved (includes grades 3 and 4 improvement and normal plus near normal spinal fluids), for dementia paralytica and dementia paralytica with tabes combined 21, or 58 per cent, were definitely improved and 14 became normal or near normal (39 per cent) Of 51 tabetic patients 44, or 86 per cent, definitely improved and 29 or 57 per cent, became normal or near normal, and of 30 asymptomatic neurosyphilitic patients 21, or 70 per cent, definitely improved and 18 or 60 per cent, became normal or near normal Of 33 meningovascular patients 24 or 72 7 per cent, achieved definite improvement, and the spinal fluids of 15 or 45 per cent, became normal or near normal Of 16 patients with congenital neurosyphilis 13, or 81 per cent, achieved definite improvement and 10, or 63 per cent became normal or near normal

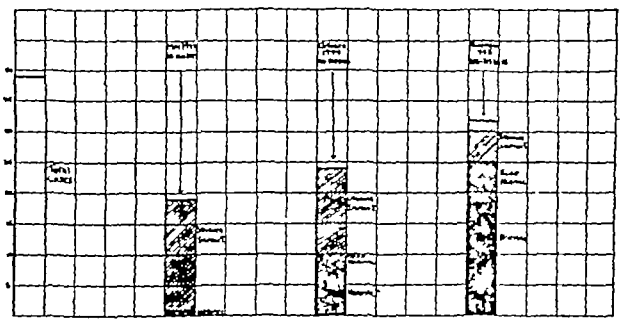

Chart 1.—Progress of the original 39 cases of neurosyphilis toward spinal fluid normality regardless of type of neurosyphilis dose of penicillin or number of courses

The good spinal fluid results in tabes and congenital neurosyphilis as well as in dementia paralytica deserve special note Only 6 fluids in the entire series (3 3 per cent) became worse

### *CLINICAL RESPONSE TO PENICILLIN* [5]

Our results are summarized for 119 cases with improvable symptoms (table omitted)

Striking improvement was obtained (including normal and near normal spinal fluids) at 120 to 364 days

[3] Stokes J H Beerman H and Ingraham N R Jr Modern Clinical Syphilology ed 3 Philadelphia W B Saunders Company 1944 [4] Stokes J H Sternberg T Schwartz W H Mahoney J F Moore J E and Wood W B Jr The Action of Penicillin in Late Syphilis J A M A **126** 737-9 (Sept 9) 1944

[5] A more detailed report on individual symptomatology is being prepared with Gammon as spokesman

in 35 cases, or 69 per cent on low and in 37 cases, or 71 per cent on high dosage At 365 to 599 days striking improvement stood at 84 per cent (21 cases) for low and 67 per cent (14 cases) for high dosage, and for the longest observed cases 600 days and over

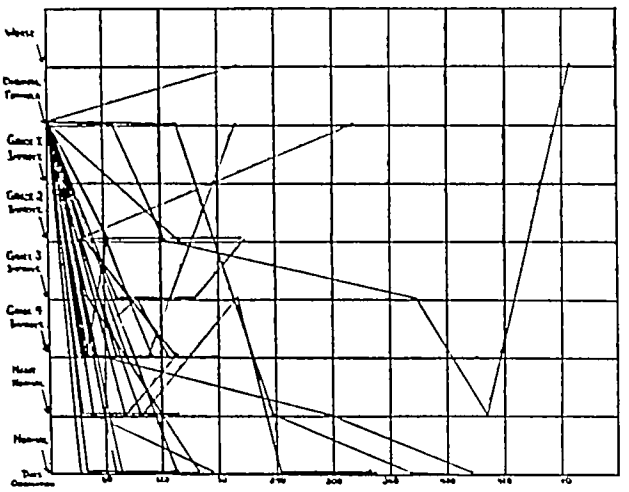

Chart 2.—Behavior of the spinal fluid in asymptomatic neurosyphilis following one course of penicillin regardless of dose (type 3 fluid formula)

it stood at 84 per cent (10 cases) for low and 90 per cent (9 cases) for high dosage

Summarizing with apologies for the graphic use of "per cent" terminology symptomatic neurosyphilis showed overall a symptomatic improvement of some degree in 77 cases, or 65 per cent Definite or striking improvement occurred in 28 cases, or 24 per cent Slight improvement occurred in 49 cases or 41 per cent, there was no change in 31, or 26 per cent, and 11, or 9 per cent were worse Five of these 11 patients had dementia paralytica Of 20 patients with dementia paralytica 6, or 30 per cent showed definite improvement, 7, or 35 per cent, showed slight improvement 2 or 10 per cent, no change and 5, or 29 per cent, were worse Of 23 patients having dementia paralytica with

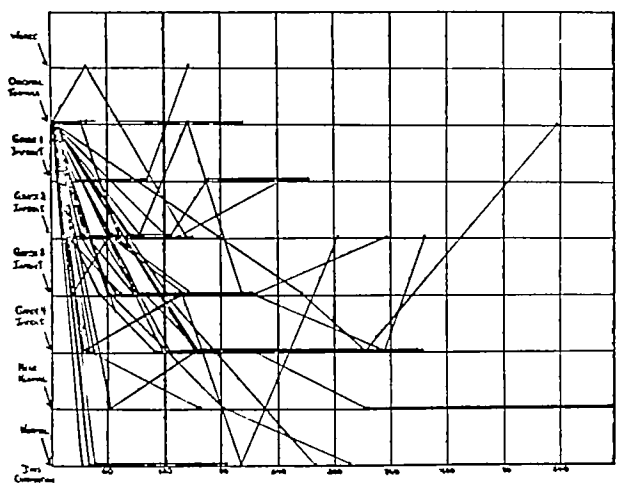

Chart 3.—Behavior of spinal fluid in clinical dementia paralytica and dementia paralytica with tabes (type 3 fluid formula)

tabes 3, or 13 per cent, were decidedly improved, 9, or 39 per cent, were slightly improved, 9, or 39 per cent, showed no change, and 2, or 9 per cent, were worse Of 42 patients with tabes 13, or 31 per cent, showed definite improvement, 18, or 43 per cent, slight improvement, 9, or 21 per cent, no change and 2, or 5 per cent, were worse Of 34 patients with meningovascular neurosyphilis 6, or 17 per cent, were definitely improved, 15 or 44 per cent, slightly improved, 11, or 32 per cent, showed no change, and 2, or 7 per cent, were worse.

The response of symptoms in neurosyphilis is, then, good for the types named, in view of the duration of observation The good record in tabes dorsalis seems to be especially due to the effect of penicillin in lightening pain In Charcot joints (not included in this series) no improvement occurred in 4 cases, and in 5 cases of gastric crises 2 improved

### SPINAL FLUID RESPONSE IN RELATION TO DOSAGE OF PENICILLIN AND PERIOD OF OBSERVATION

The volume of material and variety of dosage employed permitted only a division into high and low dosage as in the earlier reports[6] We give the results (table omitted) in 175 cases (for code used see table 2) for a range of 1.2 to less than 4.8 million units in one or two courses ("low dosage") as compared with 4.8 to 10 million units in one to four courses ("high dosage") observed for three time periods, 120 to 364, 365 to 599 and 600 or more days

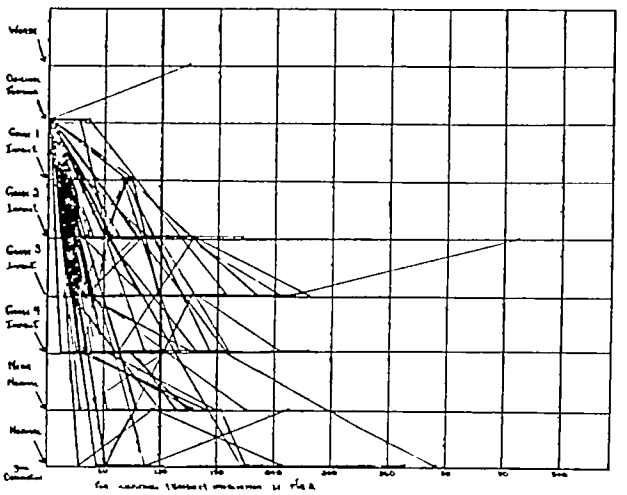

Chart 4.—Behavior of the spinal fluid in tabes dorsalis following one course of penicillin regardless of dose (type 3 fluid formula)

Within the limitations imposed by some small numerical groups in the higher brackets, it would seem that there is really surprisingly little difference between the effect on the spinal fluid of lower as compared with higher dosage This confirms a suggestion contained in our first report[4] There is a slight but definite upward trend of good results with longer observation and more treatment, perhaps, but there is still such a trend in the lower as compared with the higher dosage bracket This suggests to us first that, if penicillin will be effective at all in a given case, lesser amounts may suffice and an early response will be noted It will be "utilized" in other words If less is not effective large amounts are at least not greatly superior In other words a part of the excess penicillin may be "thrown away" But the occasional individual case result with late improvement after large dosage inspires or tempts one to the use of larger amounts

The prolongation of the effect of penicillin beyond the time of administration or even beyond the 120 days subsequent thereto (charts 2, 3 and 4) well into months

6 Gammon, G. D Stokes J H Beerman, H Ingraham N R Jr Lentz, J W Morgan H G Steele, W H and Rose, E L Penicillin in Neurosyphilis J A M A 128 653 654 (June 30) 1945

and perhaps even a year or more after treatment as in malarial therapy, for example, is also suggested

It is conceivable too that, if commercial penicillin contains a factor of special efficiency in syphilis in small or varying amounts, large total dosage will tend to deliver more of it ultimately than small The figures here do not seem particularly to support such a hypothesis

### SPINAL FLUID RESPONSE IN RELATION TO NUMBER OF COURSES OF PENICILLIN

The examination of this question (table omitted) is, of course, complicated by the influence of increasing dosage and a selection factor involving the more prolonged treatment of the refractory case Thus a patient failing to respond either clinically or serologically in 120 days to one course was more likely to receive two or three courses Nonetheless, examination of the striking improvement group (grades 3 and 4, and normal, and near normal spinal fluids) among 119 cases classified in the same observation period groups as with dosage response discloses a similar upward or favorable trend Combining the three observation periods, in 81 one course cases 80 per cent, in 75 two course cases 67 per cent and in 16 three course cases 81 per cent showed striking improvement With apologies for the use of percentage terminology again, a rise ranging from 78 to 100 per cent in the three time periods with a single course seems perhaps a little better than a rise from 60 to 82 per cent with two courses There is no clearcut demonstration here of the value of repeated courses as such, rather a suggestion of the striking effect of a single course It seems clear that in both single and repeated courses prolonged observation reveals more and more good effect.

### EFFECTS OF PENICILLIN ON THE SPINAL FLUID IN RELATION TO TIME ELAPSED AFTER ADMINISTRATION

This series of three graphs (charts 2, 3 and 4) includes cases which presented type 3 spinal fluid formulas at the start, observed a minimum of 20 days after a single course of penicillin, regardless of dose Type 2 fluids which have a better prognosis, generally speaking, were not separately tabulated because of small numbers The graphs have been statistically checked by Dr Harold Austin and show significant differences by the chi square test, in the response of symptomatic and asymptomatic neurosyphilis

All three graphs confirm the observation in a previously published paper [6] that a striking downward trend of the abnormal fluid formula toward normal occurs in the first 120 days and that most of the effect of one course is manifest within this time Certain differences between the symptomatic and asymptomatic groups appear

In asymptomatic neurosyphilis, even with type 3 (less favorable) spinal fluid formulas, the trend from definite improvement toward normal or near normal is more pronounced than in symptomatic dementia paralytica and dementia paralytica with tabes or tabes dorsalis The response of the spinal fluid in clinical dementia paralytica and dementia paralytica with tabes is more delayed than in asymptomatic neurosyphilis The downward trend toward normal in tabes with type 3 fluid is more rapid and achieved in shorter time than in dementia paralytica and dementia paralytica with tabes

There is more tendency to relapse to the original formula in dementia paralytica than in asymptomatic neurosyphilis (type 3 fluid) or tabes (type 3 fluid) A relatively larger proportion of spinal fluids in asymptomatic neurosyphilis achieves normal or near normal spinal fluids than in dementia paralytica and dementia paralytica with tabes, i e, improvement in more advanced forms of neurosyphilis tends to stop short of normal or near normal as compared with asymptomatic neurosyphilis

In this respect penicillin conforms to the expectancy of other forms of treatment for neurosyphilis

While all three graphs support the observation previously made [6] that maximum improvement secured by one course takes place most frequently within the first 120 days, more prolonged observation has led to the identification of more and more cases which level off and approach normal or near normal categories after a single course Relatively few cases sustain outright relapse to original formula or worse after a single course, within the period of our observation If courses are to be repeated, *it would seem that the logical time* for repetition of the penicillin course would, as indicated in the previous study referred to, be 120 days after the first course of penicillin

With reference to the relapse phenomenon (return to the original formula or worse), it may be said that negative fluids can relapse to varying degrees, although frank return from negative to the original degree of abnormality is rare

*An initially inferior fluid response (within 120 days* after the first course) does not necessarily foreshadow unfavorable subsequent response, for approximately as many patients who ultimately achieved a good result did less well at the start as the reverse The trend after 120 days still continues downward toward improvement and negative spinal fluid in asymptomatic neurosyphilis and tabes and even in dementia paralytica and dementia paralytica with tabes In the last mentioned, however, the tendency to level off short of normal is more pronounced

### RESPONSE OF THE BLOOD SEROLOGIC TESTS TO PENICILLIN IN NEUROSYPHILIS

The code for the grading of blood serologic improvement is omitted There is no concomitance recognizable between blood and spinal fluid improvement Of 115 cases with initially seropositive bloods showing definite spinal fluid improvement, only 36 cases, or 31 per cent, showed definite improvement in the blood In 30 cases the blood titer rose and in the same number (23 per cent) it remained unchanged Of 82 cases with initially positive bloods, achieving normal or near normal fluids, 25 cases, or 30 per cent, showed definite improvement in blood titer, 44, or 54 per cent, were worse or showed no change Thus the proportion of (perhaps temporary?) blood serologic failure despite definite spinal fluid improvement is 46 per cent

It would almost seem as if a different mechanism is involved in blood response as compared with spinal fluid It can at least be said that the effect of penicillin on the spinal fluid is much more definite, almost tropic one might say, as compared with the effect on the blood, and that, within the period of observation of this study, blood findings have little significance for a symptomatic or spinal fluid result

### MISCELLANEOUS CONSIDERATIONS

*Meningeal Reaction in Relation to Penicillin Response* (spinal fluid cell count as indicator).—Of 96 cases showing higher cell counts (10 or over)

57 per cent reached normal or near normal and 81 per cent were strikingly improved Of 17 with lower cell counts, 36 per cent reached normal or near normal and 55 per cent were strikingly improved The conclusion that meningeal reaction (elevated cell count) is favorable to penicillin effect is vitiated here by the fact that an unknown proportion of low cell counts may have been the result of previous treatment of high cell count cases by other methods

*Effect of Previous Nonpenicillin Therapy, Including Fever, on Penicillin Results*—On this we are unable to make a clear statement because of small numbers of cases and the question as to whether the results are not "stacked" by the undoubted fact that resistant cases unresponsive to ordinary methods tend to drift to a new method thus weighting the figures against the previously treated cases

Our own figures show a trend toward better penicillin response in previously untreated or minimally treated cases A strikingly more favorable response in tabes and in meningovascular and asymptomatic neurosyphilis that has not received fever therapy may be an affair of weighting and selection but should be watched

*Primary Optic Atrophy*—The evaluation of this material comprising 60 cases, 19 observed over 365 days and 27 over 300 days, was conducted by Dr Willard H Steele, representing the Department of Ophthalmology in the Penicillin-Syphilis Group, and will be published in detail separately Briefly it may be summarized in part as follows In all evaluation of primary optic atrophy results, time and certain subjective elements in the current tests are critical considerations As yet the objective and controlled evaluation of these elements is not fully accomplished Hence it is impossible to offer here any conclusive statements about penicillin responses in primary optic atrophy It may be said that improvement in spinal fluid formula and reduction to normal in better than 75 per cent occur in patients with primary optic atrophy despite failure of improvement or even unfavorable progression in the eyes Far advanced cases are least favorably affected and may progress in spite of penicillin therapy, while early cases in which advice has had to be sought because of failing visual acuity rather than field shrinkage (which attracts attention later) will do better It cannot be said that "no cases treated with penicillin get worse," for advanced ones may progress Of 19 patients treated and observed for one year, 2 were blind but showed improvement in cerebrospinal fluid Two showed early or questionable atrophy, with improvement of cerebrospinal fluid Of 4 cases presumably arrested prior to penicillin therapy but with abnormal fluids, 4 showed no change in fields, including 1 that showed diminution of visual acuity, yet the spinal fluids of all 4 improved and 3 became normal Of 9 that were presumably progressing prior to treatment (one with a normal spinal fluid) 4 showed further field contraction and 4 showed no change The 8 abnormal fluids all improved, and 7 of them became normal One of the 9 patients became "blind" Of 3 congenital syphilitic patients 1 was blind, 1 showed no change in fields but improvement in spinal fluid and 1, presumably progressing, showed no change but the fluid became normal It seems clear that the striking effect of penicillin on the spinal fluid is not necessarily reflected in ocular response

Accordingly, as other investigators have concluded also, the essence of securing response is in early diagnosis and early treatment rather than in treatment after degenerative change is established Why if, as Breutsch[7] contends, the pathology of primary optic atrophy is vascular-inflammatory in character, like that of dementia paralytica, are not the symptomatic results in primary optic atrophy under penicillin equally good as compared with dementia paralytica? Partly at least, let us hypothesize, because each neuron lost in the optic tract represents a specialized and irreplaceable functional unit The optic nerve and its neurons have no functional margin The brain, on the other hand, has a large functional margin of less specialized neurons, and many neurons may be lost before the limits of improvement or restoration of function are reached

Since lost ground is not recovered so far as the optic nerve is concerned, until data are conclusive, patients with primary optic atrophy should be treated with maximum total dosage of penicillin by the longest of the available time schedules

## A COMPARISON OF OLDER TREATMENT METHODS WITH PENICILLIN THERAPY OF NEUROSYPHILIS, USING COOPERATIVE CLINICAL GROUP RESULTS

This ambitious undertaking involves many uncertainties based on differences in terminology, method of approach and ambiguities on both sides Nonetheless it is attempted to utilize a straw to show which way the wind blows The Cooperative Clinical Group results are those cited in the third edition of Modern Clinical Syphilology[8] and were prepared from the graphs of figure 8 in Kierland, O'Leary and Vandoren's paper[8] and the additional information in O'Leary and his associates[9] on asymptomatic neurosyphilis Since no figures are given in the text of the first paper, figure 8 was chosen because the results stated are com-

7 Breutsch W L Syphilitic Optic Atrophy J A M A. **130** 14 (Jan 5) 1946
8 Kierland R R O Leary P A and Vandoren E Symptomatic Neurosyphilis Ven Dis Inform **23** 360-377 (Oct) 1942
9 O'Leary P A Cole, H N Moore J E Stokes J H Wile U J Parran T, Vonderlehr R A and Usilton Lida J Asymptomatic Neurosyphilis Ven. Dis Inform **18**: 45-65 (March) 1937

plicated by no more than one method of treatment in addition to routine therapy and thus seemed most nearly comparable to ours which included a number of previously treated cases The results of this comparison are given in table 3 An unknown amount of allowance must be made for differences in the meaning of terms i e 'taboparesis" and "marked improvement" used by the various investigators It should be recalled that the Cooperative Clinical Group material covered a much longer period of observation, in which the trend to normal with time was clearly evident Penicillin comparisons should therefore really be made not now but ten years from now

It will be seen that if their normal spinal fluids are as strictly normal as we have defined them Cooperative Clinical Group results are a little better on the spinal fluid in some categories than are penicillin results but, in the main penicillin outclasses malaria alone or as the successor of routine treatment If normal and near normal categories are combined penicillin surpasses the older methods In asymptomatic neurosyphilis it ranks far above other methods as a reducer of spinal fluid formulas to normal

In the field of clinical improvement malaria outranks penicillin but since malarial results are notably slow of achievement in the aggregate and a ten year material will bring out the best in malarial therapy, penicillin with a two year record as a symptomatic therapeutic agent cannot yet be properly judged

## CONCLUSIONS

1 The effects of penicillin alone in neurosyphilis, in single or repeated courses in a dosage range of 1 2 million to 10 million units and over, were observed

2 Penicillin sodium in saline solution in a round-the-clock three hour intramuscular administration technic is effective to greater or less degree in the treatment of all aspects of neurosyphilis studied

3 An adequate mechanism for spinal fluid examination and testing is sine qua non to the work Effective follow-up was secured in over 97 per cent of our cases

4 The most striking effects of penicillin are exerted on the spinal fluid formula, the most sensitive and dependable of our indexes

5 There is no apparent concomitance between spinal fluid response and serologic response in the blood The spinal fluid responses suggest almost a tropic selectivity of penicillin for the nervous system

6 There is a steady and definite increase in the proportion of normal and near normal spinal fluids (not mere improvement') obtained in our original group of patients under penicillin from 2 6 per cent at the start to 62 per cent after eighteen months prolongation of observation and appropriate retreatment

7 Definite improvement in spinal fluid occurred in 74 per cent, and normal and near normal spinal fluids were achieved in 36 per cent of our total series of neurosyphilitic patients without regard to diagnostic category

8 Dementia paralytica showed 62 per cent definite improvement but no negative fluids Normal and near normal fluids were, however obtained in 39 per cent of dementia paralytica and dementia paralytica with tabes combined, 57 per cent of the tabetic, 60 per cent of the asymptomatic neurosyphilitic, 45 per cent of meningovascular cases and 63 per cent of the congenitally neurosyphilitic Only 6 fluids in the entire series (3 5 per cent) became worse

9 Overall clinical improvement of some degree occurred in 65 per cent of symptomatic neurosyphilis, 24 per cent improved strikingly, 41 per cent slightly, 9 per cent were worse. Thirty per cent of those with dementia paralytica improved definitely, 31 per cent of the tabetic, 17 per cent of meningovascular patients

10 As between 1 2 and less than 4 8 million units (low dosage) and 4 8 to 10 million units and over (high dosage), surprisingly little difference in therapeutic effect is observable There is a slight trend toward superiority in the higher dosage bracket

11 There is *no conspicuous good effect demonstrable* from mere repetition of courses, so far The striking thing is the prolongation of the good effect of one course This does not invalidate the statement (paragraph 13) that most of the improvement obtained is in the first 120 days Further study of this problem is in progress

12 The good effect of penicillin on the spinal fluid is continued over weeks and months after administration

13 The maximum effect is usually secured in the first 120 days, but improvement and final normality may follow even an unsatisfactory or atypical early trend

14 Asymptomatic neurosyphilis conforms best, and dementia paralytica least, *to the 120 day rule*

15 Relapse may occur in fluids that have become negative, but relapse to original formula or severity rarely occurs

16 It is suggested, but not proved, that more definite meningeal reaction (higher cell counts) favors a good penicillin response

17 The results in primary optic atrophy are as yet inconclusive Treatment should be begun early with large doses Charcot joints have not thus far responded to penicillin intramuscularly, but 2 of 5 cases of gastric crises improved Lightning pains improved, raising *the proportion of good symptomatic results in tabes*

18 A comparison between Cooperative Clinical Group results using older methods including chemotherapy and fever, and our penicillin results suggests that, particularly as the observation of penicillin effects lengthens, it will be be found to equal or exceed the efficiency of malaria alone or after routine chemotherapy

19 Penicillin is outranked by malaria as yet in clinical improvement, probably because of the short observation period of penicillin

20 In asymptomatic neurosyphilis, penicillin ranks far above other methods as a reducer of the spinal fluid to or toward normal

21 A single course of not less than 4 8 million units in not less than 7 5 days round the clock, using penicillin sodium in saline solution intramuscularly, would seem in our experience to make the best start and often an adequate total therapy for the majority of cases of neurosyphilis Observation should be carried over at least a year in the absence of convincing evidence of progression before the effects are evaluated and further measures adopted

22 The results which have been (or are to be) presented in this paper must be interpreted in light of the fact that from June 1943, the date of inception of the

study, to the present commercial penicillin has been a changing mixture of various substances The content of "impurities" has gradually decreased as potency, in terms of units per milligram, has increased The relative amounts of the several identified penicillin fractions G, F, X and K have likewise varied from time to time Those two changes, and perhaps others, suggest that therapeutic efficacy may not have remained constant and that it may be significantly different today from what it was originally It is not now possible to assess the extent to which these changes may have affected the results here reported

## FOLIC ACID THERAPY IN THE ANEMIAS OF INFANCY AND CHILDHOOD

WOLF W ZUELZER M D
Detroit

In a previous report [1] it was shown that anemias with a megaloblastic type of blood formation in the bone marrow are common in white infants under the age of 18 months and constitute a syndrome which is specifically influenced by folic acid The effect of folic acid in the various macrocytic anemias of adults in which the bone marrow is of the megaloblastic type has recently been demonstrated by Spies and his associates [2] The results reported by this group and those obtained independently in our laboratory are identical and leave no doubt that folic acid is a specific antianemic substance the lack of which results in megaloblastic dysplasia of the bone marrow elements and anemia the latter usually of macrocytic type The hematologic criteria for the recognition of the anemic syndrome in infants in which folic acid is effective have been given in detail in our previous communication Briefly summarized they consist in the following features

1 The presence of severe normochromic anemia, usually but not invariably macrocytic as determined by mean corpuscular constants, characterized by a wide spread in the corpuscular diameters as seen in a study of Price-Jones curves

2 A tendency toward leukopenia and neutropenia associated with the presence of giant metamyelocytes and so-called "macropolycytes" and hypersegmented neutrophils in the peripheral blood

3 A diminution of platelets, sometimes of severe degree and often associated with an increased bleeding tendency

4 An atypical bone marrow pattern as seen in fixed and stained smears of aspirated femoral or sternal marrow, resembling or in some cases identical with the pattern seen in addisonian pernicious anemia in relapse Erythropoiesis is frankly megaloblastic in the advanced stages of the syndrome but may present a pattern intermediate between normoblastic and megaloblastic in earlier phases The prevalence of abnormal young granulocytes of the type encountered in addisonian pernicious anemia is a constant early finding of considerable diagnostic value

The clinical picture is variable Splenomegaly is a common but not a constant finding Evidence of infection is usually present The nutritional history is usually poor but may be entirely satisfactory as judged by present day standards Histamine refractory achlorhydria is frequently demonstrable but does not persist after the anemia is cured

Up to the present time a total of 29 patients with this syndrome for which the designation megaloblastic anemia of infancy was proposed have been studied in our laboratory [2a] Twelve of these were treated with folic acid [3] in synthetic form or by oral administration of concentrates rich in "Lactobacillus casei factor" The dosage varied from 5 to 20 mg per day, the period of treatment from eight days to three weeks In each case the requirements of Minot and Castle [4] for the evaluation of the reticulocyte response were met Three of the patients died of severe infections before the effect of folic acid could be evaluated In the remaining 9 patients an unequivocal response was obtained This response was characterized by a decided rise in the reticulocyte counts within a few days after the beginning of treatment, as shown in the chart This was preceded by a return of the bone marrow pattern to a normal type of erythropoiesis and followed by a consistent rise in the hemoglobin values and the red cell counts without further antianemic treatment The effect of folic acid was indistinguishable from that of commercial purified or crude liver extracts given to other patients with megaloblastic anemia In follow-up studies up to ten months no relapses were observed in either group

The present report is intended to give a brief account of studies on the effect of folic acid in a variety of anemic conditions observed in infants and children, other than megaloblastic anemia In view of the specific character of the folic acid effect, it was predicted that this substance would not be effective in any of those types of anemia in which the formation of blood by the bone marrow remains normoblastic This prediction has been substantiated by our completely negative results with folic acid therapy in children with anemia of prematurity (18 cases), hypochromic microcytic

From the Anemia Clinic of the Children's Hospital of Michigan and the Department of Pediatrics Wayne University College of Medicine

anemia (5 cases), Mediterranean anemia (1 case), chronic hypoplastic anemia (2 cases), aplastic anemia (1 case), subacute myelogenous leukemia (1 case), acute lymphatic leukemia (1 case) and sickle cell anemia (1 case) In none of the patients with these conditions was a reticulocyte response obtained, nor did improvement of the anemia result even when relatively large amounts (up to daily doses of 50 mg of synthetic folic acid given parenterally) were used The prophylactic use of folic acid from birth on over a period of months in premature infants did not prevent the development of anemia comparable to that observed in control patients Combining folic acid with iron therapy did not increase or accelerate the effect of the latter in cases in which iron was indicated It is therefore unnecessary to discuss in detail any of the cases in this control group The findings are again in accord with those recently reported by Spies and his group [5] The studies of folic acid therapy in anemia thus show a complete agreement of results obtained in infants with those in adults

The intensive study of bone marrow patterns and the adoption of criteria long generally accepted in anemias of adult life but hitherto neglected in the studies of anemia of infancy have made it possible to establish morphologic criteria for the presence of a deficiency in folic acid and to define the syndrome associated with such a deficiency as megaloblastic anemia of infancy The recognition of this entity opens a new era in the understanding of mechanisms involved in the production of anemias of early life and clarifies to a large extent the confused classification of the anemias in this age group

Typical response to folic acid in megaloblastic anemia of P O a white girl aged 7 months

Further studies are in progress in order to elucidate the etiologic factors which can bring about a folic acid deficiency in infants and to reevaluate Castle's hypothesis in relation to folic acid Spies has pointed out that the effect of liver extracts or brewers' yeast in macrocytic anemias of adults is out of proportion to the amount of folic acid contained in these substances, and it remains to be seen whether factors other than folic acid can have a specific effect on megaloblastic anemias

## CONCLUSIONS

Folic acid is an antianemic factor specifically effective in anemias of infancy with megaloblastic bone marrow and ineffective in any of the other anemias of infancy and childhood investigated thus far The characteristic abnormal bone marrow pattern constitutes the essential criterion in the diagnosis of megaloblastic anemia of infancy, which is a common syndrome arising on the basis of a folic acid deficiency There is a complete parallelism regarding the response to folic acid between the anemias of infancy and those of adult life

# FILARIASIS IN THE SERVICEMAN RETROSPECT AND PROSPECT

CAPTAIN L. T COGGESHALL (MC) U.S N R

Many physicians throughout the United States will be faced with the problem of filariasis for the first time as several thousand servicemen have contracted the infection during the war and are now being demobilized Not only will the individual seek treatment and counsel but the community will likewise wish to know the facts concerning possible danger of secondary transmission It is my purpose in this paper to acquaint the doctor with some of the more salient points observed in Marines with filariasis at Klamath Falls, Oregon, where 2,595 were collected and observed during a seventeen months period

Filariasis is an infection produced by a nematode which is transmitted only by an intermediate host There are four varieties carried by insect vectors (mosquitoes) and one by an aquatic crustacean The most common filarial organism and the one under discussion is known as Wuchereria bancrofti It is prevalent in many islands in the Pacific, particularly in the Samoan group, and also in Africa Surveys in these hyperendemic areas reveal that approximately 60 to 70 per cent of the population are infected The complication of elephantiasis is common, although there can be filariasis without elephantiasis—a sign of low endemicity At one time filariasis was frequently encountered in the United States, having been imported with the slaves from West Africa It made its appearance in several states, Alabama, Indiana, Pennsylvania, Virginia and particularly South Carolina, where transmission factors were the most favorable However, the disease was unable to perpetuate itself after the slave trade was interrupted and disappeared spontaneously about 1925 This coincides with a similar episode in Australia, where the same disease was introduced through the medium of infected laborers from some Central Pacific islands At one time 10 per cent of all persons hospitalized in Brisbane had the disease Here as in the United States filariasis disappeared without specific control measures The importance of the two incidents can readily be seen, as they furnish evidence that the lightly infected serviceman should present no danger as a source of spread in this country

## LIFE HISTORY OF FILARIAL PARASITE (WUCHERERIA BANCROFTI)

When the proper mosquito vector, of which there are several species, obtains blood from an infected person, the circulating larvae (microfilariae) are drawn into the stomach, begin their development, penetrate the walls and enter the body cavity As the infected mosquito bites, she deposits a small drop of salivary fluid on the skin containing a few larvae, which penetrate as the fluid evaporates Or the larvae may be introduced directly through the fissure made by the bite

This article has been released for publication by the Division of Publications of the Bureau of Medicine and Surgery of the U S Navy The opinions and views set forth in this article are those of the writer and are not to be considered as reflecting the policies of the Navy Department

Wilbur V Charter H V(S), U S N R Lieut. Leonard P Eliel (MC), U S N R, Lieut Robert G Heskett (MC) U S N R Lieut Samuel Spector (MC) U S N R and Lieut. O K. Scott U S N R.

No further trace of the larva is possible until it is recognized as an adult worm in a lymphatic channel or node The most favored sites are the larger lymphatic trunks of the aorta, but the sites easiest recognized are the more superficial ones in the groins, axillas and spermatic cords Here the adult worms become sexually mature, fertilization occurs by direct contact of the sexes, and the gravid female exudes microfilariae, which can be found in chylous urine or lymph in dilated vessels They ultimately can be found in the general circulation, where they are available for transfer to the mosquito, although they may disappear and severe infection can exist without the existence of microfilariae in the blood As far as the practitioner is concerned there are two important points of consideration in the life history of filariasis First, the microfilariae are nonpathogenic and can be transferred directly to an uninfected individual without danger of setting up an infection These larval forms must go through a proper mosquito before they are pathogenic for man Secondly, the adult worms cannot reproduce themselves in the human host, so that there is no possibility of accumulating more filariae than were originally injected through the bite of the infected mosquito

## EPIDEMIOLOGY

Filariasis (Wuchereria bancrofti) is commonly encountered throughout the tropical belt but is especially prevalent in Africa and the Samoan area of the Pacific There are numerous mosquito vectors In some areas it is transmitted by day as well as by night biting mosquitoes In general the biting habits of the vectors coincide with the appearance of the maximum numbers of circulating microfilariae The disease is primarily an urban one and the flight range of most vectors is short, rarely exceeding 300 yards in seeking their blood meal

When the Marines went into the Samoan area early in 1942 there was the extreme military necessity of getting under cover rapidly, and the most accessible spots were the native villages Here the infection was most intense because the close community life of the natives resulted in constant reinfection Naturally the available servicemen were likewise the recipients of an overwhelming number of infected bites The possibility that these men might become infected was taken lightly, because this region had been occupied for a number of years without evidence of filariasis in the white man However, previous residents had lived in more protected screened areas, and some cases now have been diagnosed in retrospect in view of the present experience Actually many believed that the white man was not susceptible, although in addition to other reports it had been shown early in 1915 in this country by Johnson [1] and in Australia by Croll [2] that this was not true During this war there was no doubt that the white man was susceptible, as thousands developed the disease As nearly as can be ascertained 38,300 men were exposed, and a filariasis registry showed a total of 10,421 diagnosed cases in the Marine Corps and United States Navy as of Dec 1, 1945 (table 1) There were many cases the diagnosis of which was not entered into the health record On the other hand, many were erroneously diagnosed merely on their history or by a positive skin reaction There was considerable difficulty in establishing the diagnosis in the early cases because most medical officers, including those who had spent considerable time in the area, were not familiar with the disease, especially with the early manifestations However within three to six months, as a result of lymph node biopsies and detection of the adult worm, it was apparent that the disease was filariasis A directive was then issued for the removal of all men from the area, and patients diagnosed as having the disease were returned to the United States Another point of interest in the epidemiology of the disease was the high rate of infection in the Samoan area, yet practically no cases were acquired in similar areas where the incidence of infection in the natives was just as high This is explained by the quartering of troops in immediate contact with the natives on Samoa, while on Guadalcanal, for example, they were more isolated Also in Samoa vectors were day biting

2 Croll D G Filariasis Among Australian Troops Brit M J 1:28 1919

## SIGNS AND SYMPTOMS

Little of the recorded literature on filariasis deals with the acute manifestations of the infection as seen in the serviceman It is concerned primarily with the later stages as observed in natives who have been reinfected over a period of years The first signs and symptoms after exposure appeared over a wide period, 0 6 per cent had a symptom free period of less than one month and 9 per cent had an incubation period of over eighteen months, while the greatest number, 24 per cent, had their first symptoms between the tenth and the twelfth month

TABLE 1—*Cases Diagnosed*

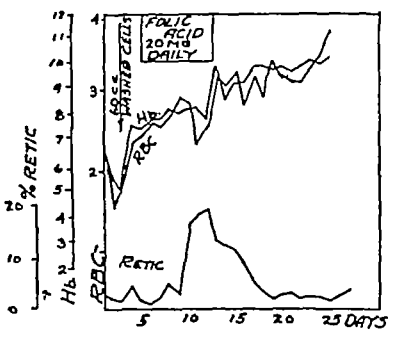
|---|---|---|
| Marines | 8,548 | 326 |
| Sea Bees | 893 | 4 |
| Medical Department, Navy | 359 | 61 |
| Other | 214 | 16 |
| Total | 10 014 | 407 |

TABLE 2—*Location of Initial Anatomic Involvement in 2,288 Men*

| Site | Number | Per Cent |
|---|---|---|
| Neck | 80 | 2 |
| Upper extremities | 1 084 | 31 |
| Lower extremities | 314 | 9 |
| Genitalia | 1 155 | 33 |
| Lymph nodes | 855 | 25 |
| Total | 3 488 | 100 |



A history of the initial signs of filariasis noted that they were confined to the lymphatic system and expressed themselves as lymphangitis, lymphedema and lymphadenopathy These acute cardinal signs usually appeared after exercise and responded to rest within three to five days

The anatomic location of these involvements as compiled from health records and testimony is shown in table 2 It was found but not shown in the table that the right upper extremity was involved in 24 per cent more instances than the left, while the left cord and testis showed up in 20 per cent more cases than the right Systemic manifestations were extremely mild and at most consisted of a mild leukocytosis and a low grade fever of 100 to 102 F with malaise None were ever very toxic, although a few complained of mild chills

Lymphangitis occurred principally along the course of the great vessels of the extremities and in the spermatic cords In the extremities there was *modera-*

anemia (5 cases), Mediterranean anemia (1 case), chronic hypoplastic anemia (2 cases), aplastic anemia (1 case), subacute myelogenous leukemia (1 case), acute lymphatic leukemia (1 case) and sickle cell anemia (1 case) In none of the patients with these conditions was a reticulocyte response obtained, nor did improvement of the anemia result even when relatively large amounts (up to daily doses of 50 mg of synthetic folic acid given parenterally) were used The prophylactic use of folic acid from birth on over a period of months in premature infants did not prevent the development of anemia comparable to that observed in control patients Combining folic acid with iron therapy did not increase or accelerate the effect of the latter in cases in which iron was indicated It is therefore unnecessary to discuss in detail any of the cases in this control group The findings are again in accord with those recently reported by Spies and his group [5] The studies of folic acid therapy in anemia thus show a complete agreement of results obtained in infants with those in adults

Lymphangitis occurred principally along the course of the great vessels of the extremities and in the spermatic cords In the extremities there was moderate

1 Johnson, F B Filarial Infection South M J 8 630 1915
2 Croll D G Filariasis Among Australian Troops, Brit M J 1 28 1919

edema and tenderness but, unlike the more commonly seen streptococcic lymphangitis, it was always retrograde and there were diffuse patches of subcutaneous edema with overlying redness and heat There was usually a more clearly defined central red streak that extended from a few centimeters to the length of the extremity After the subsidence of the acute stages a firm cord could be palpated

Lymphadenitis was noted particularly in the axillas, groins and epitrochlear regions The nodes may be discrete or matted and moderately tender They do not undergo suppuration

Lymphedema was the least frequent finding and occurred at various sites over the body surface Occasionally it was observed about the eyes, over the scapular or deltoid regions and especially around the cubital fossae Frequently it was noted as a cold puffiness 2 to 6 inches in diameter with an elevation of ½ to 1 inch

The spermatic cords were frequently thickened and tender and often there was considerable swelling of the scrotal tissues It was not felt that the testicular tissues were enlarged

Complaints of subjective symptoms were far more numerous than objective findings They consisted primarily of cramplike pains radiating from the scrotum into the abdomen generalized aches and pains, numbness malaise and fatigue In general it was found that

TABLE 3.—*Number of Palpable Nodes in Filariasis, Malaria and Controls*

| | Filariasis | Malaria | Controls |
|---|---|---|---|
| Inguinal | 2 4 | 2 3 | 1 9 |

| Axillary | 1 1 | 0 8 | 0 8 |
| Epitrochlear | 0 4 | 0 3 | 0 2 |

men assigned to tasks they enjoyed seldom reported to the sick bay and those who sought to better their position reported regularly For example, men on the football and basketball teams did not experience any difficulty, while men on guard duty and police details would complain bitterly

Records of the 2,595 cases observed over seventeen months showed that only 22 per cent ever showed any objective findings of acute filariasis if the presence of "shotty" lymph nodes is discounted and only 18 men, or 0 07 per cent had to be hospitalized for their flare-ups The majority were able to perform full or modified duty at all times

## PSYCHOLOGIC ASPECTS OF FILARIASIS

Along with a more thorough appreciation of the somatic symptomatology and clinical course of filariasis has come an understanding of the psychologic effects of this disease Recognition of the existence of the psychiatric components has clarified many misconceptions which arose in regard to this disease Especially prominent were unfounded fears of sexual sterility and impotence and fear of development of elephantiasis of the limbs and the scrotum There soon supervened a realization that their anxiety was not justified Only in cases of previously psychoneurotic or psychologically inadequate persons were fears concerning this disease retained Even in areas of high endemicity there is no interference of the reproductive function in the natives The phobic states concerning elephantiasis derived mainly from identification with native Samoans in areas where the disease was first encountered and from the lack of existing medical knowledge at that time concerning the probable course of the disease This state of apprehension was almost universally seen among Marines with early signs of filariasis and was ably described by Rome[3] Subsequent proof that the fears of sexual sterility and impotence were unfounded was obtained from the finding that 107 of 504 marriages after six months had already resulted in pregnancy and the incidence of disturbed sexuality of psychogenic origin was well within the range of normality

## DIAGNOSIS

The absolute diagnosis of filariasis depends on the detection of the adult worm in biopsy or the circulating microfilariae in concentrated blood samples The latter finding was never made in the men examined at this post, although the search was repeated several times on many A final survey of 250 men who had been infected almost four years was completely negative Therefore this procedure is not considered sufficiently valuable for practical purposes Other reports indicate that the occasions on which the microfilariae have been found were less than twenty in the several thousand cases The adult worm has been found only on rare occasions

The blood picture was of little assistance except for a slight increase in eosinophils Also this finding was just as prominent and frequent in men who had been in tropical areas but had not acquired filariasis

Use of various antigens for skin reactions showed that approximately 85 per cent were positive About 15 per cent of normal persons gave false positive reactions

The physical examination reveals little except adenopathy, the significance of which is doubtful

In order to establish the diagnostic significance of the palpable lymph node, 200 men with accepted diagnoses of filariasis were examined carefully and compared with 271 cases of malaria in overseas men and 98 men of a comparable age group who had never been overseas The proportion of demonstrable adenopathy in these men was filariasis 60 per cent, malaria 57 per cent and controls 50 per cent There was a correlation between the presence of an active fungous infection and enlarged nodes, especially noted in the overseas groups but there was no significant difference between the size or number of nodes in the men with filariasis and malaria (table 3) Therefore, it is held that except for the rare case the presence of palpable nodes has no diagnostic significance in filariasis

Another frequent complaint is pain and swelling of the arm or leg after heavy exertion There is no accurate way to evaluate the degree of pain in different persons, and it was the medical officers' impression that many men ascribed various aches, pains and soreness to filariasis and were seriously concerned while the nonfilarial patients on questioning would testify to an equal number of these symptoms after exertion but were totally indifferent to them In order to determine whether there was swelling associated with filariasis, 10 men with the disease and 10 without were subjected to weight lifting to the point of exhaustion Before and after measurements showed no significant difference in the two groups In summary, other than a past history of exposure and symptoms of acute filariasis there are now no practical diagnostic procedures and no clinical findings which can be relied on to establish the diagnosis in this group of men

3 Rome Howard P and Vogel R H The Psychosomatic Manifestations of Filariasis J A M A **123** 944 (Dec 11) 1943

### PATHOLOGY

Since early filariasis is a nonfatal disease, relatively little information is available on its pathology Practically all published reports to date have been limited to a study of superficial lymphatics or peripheral nodes Michael[4] has reported that a presumptive diagnosis can be made from the appearance of the tissues even in the absence of the adult worm On this station an unusual opportunity presented itself to examine the lymphatic system in detail in the case of an accidental death of a man with an unquestionable diagnosis of filariasis No adult worms were found and there was only slight evidence of lymphatic obstruction especially in the axillary region Otherwise there was nothing remarkable In 10 other instances superficial nodes were removed which showed appearance of a reactive gland, enlarged follicles hyperplasia of the lymphoid and reticuloendothelial elements and some scattered eosinophilia The reaction of lymphangitis overlaid by red blotchy areas probably is allergic in nature Permanent lymphatic obstruction with appearance of filarial elephantiasis was not observed and forms no part of this discussion

### TREATMENT

No specific therapy was employed because none of the men were ever very ill and findings were so transitory that no base line for accurate evaluation could be obtained From the time of first observation until the present there was a progressive improvement in the overall picture so that any compound employed might have given the impression of being beneficial The most valuable part of the therapeutic program was suggestion Full explanation of the cause of present difficulties with assurance of future improvement and ultimate complete recovery was used to good advantage This was demonstrated by a planned gradually increasing program of physical exertion along with activities devised to stimulate mental ease Much of the early apprehension by the men had its genesis from the fact that the returned patients attracted much attention because of the diagnosis and were repeatedly questioned and examined They in turn interpreted the interest in their condition as an indication of seriousness By repeated reassurance fears were allayed and a general improvement was apparent

Nonspecific measures as application of heat cold or x-rays to affected parts were not found to be beneficial Heat actually seemed detrimental in that it increased the pain

Necessary surgery was not found to be contraindicated because of a diagnosis of filariasis

### PROGNOSIS

Although time will be the deciding factor in determining the prognosis of filariasis the uninterrupted improvement in the general picture leaves little to be concerned about even if the occasional individual still has a filarial flare-up There are several reasons why a good prognosis can be expected In the first place the removal of the patient from the source of infection precludes the possibility that the adult worms will continue to accumulate, since they cannot reproduce themselves in the human body As stated they must pass through an appropriate vector and be reintroduced Secondly, repeated biopsy examinations have confirmed the existence of calcified or disintegrated adult worms indicative of an active curative mechanism which should in time eliminate the source of difficulty Finally the meager number of times microfilariae have been found in multitudinous searches testifies to the lightness of the infection Even in the absence of a proved specific remedy there is little doubt that the infection is self limited and that a favorable prognosis will be a certainty

### ELEPHANTIASIS

Elephantiasis due to the filarial organism results from a blocking of certain lymphatic channels and is undoubtedly produced by repeated assaults to the tissues over a period of years when exposed to numerous infected mosquito bites It is a complication that rarely involves 10 per cent of the natives in the most heavily endemic areas It is now almost four years since the first servicemen were infected and not a single case of elephantiasis has been seen in the 2 595 men at this station A word of warning to the physician in this connection is necessary as enlargement of the genitalia or extremity in a patient with the diagnosis of filariasis is not necessarily the result of that disease Two examples of this occurrence are known to me The first was a man with a grossly enlarged left testicle with a history of onset coincident with his filariasis However on biopsy the tissue examination revealed a highly malignant epithelioma The other case was a permanent elephantiasis of the left leg which was not due to filariasis but was Milroy's disease Two other members of the family had the same condition but had never been exposed to filariasis There are several nonfilarial causes for elephantiasis, such as scarring metastatic cancer thrombophlebitic disorders, hemangiomas, lymphangiomas, Milroy's disease and lipodystrophy

### THREAT OF FILARIASIS (WUCHERERIA BANCROFTI) TO THE UNITED STATES

There seems little reason to fear the establishment of filariasis in the United States as an aftermath of the returning veteran Napier[5] states that a climate favorable for the development of the larvae in the mosquito requires a mean temperature of 80 F and a humidity above 60 per cent If this is true, only a relatively small area of the United States those states bordering on the Gulf of Mexico, Georgia and South Carolina is suitable Filariasis was once prevalent in a part of that region as a result of the introduction of heavily infected slaves yet it was unable to maintain itself and died out spontaneously Also he states that it has been found that it requires approximately 15 microfilariae per drop of blood to maintain transmission This being true, the servicemen cannot be responsible for secondary transmission, since there are less than 20 recorded cases in which microfilariae have been found, and the concentration was far below the figure given by Napier Finally, there is no danger of spreading the disease by contact Actually blood from an infected donor can be used for transfusion purposes without danger, as the larvae are noninfective for man unless they have partially matured in a mosquito and been introduced by biting These and other reasons, such as better screening and mosquito control, would seem definitely to assure us that filariasis will not spread in this country and that the released serviceman cannot be a source of danger to his associates

### SUMMARY AND CONCLUSIONS

1 Filariasis (Wuchereria bancrofti) is an infection carried by certain mosquitoes and was acquired by 10,431 Navy personnel in the South Pacific area, mostly

4 Michael Paul Filariasis Among Navy and Marine Personnel U S Nav M Bull **42** 1059 (May) 1944

in the Army prepared a brief, in 1942. Copies of this memorandum [illegible] were observed in the following:

1. It was pointed out that the only type commonly [illegible] lymphangitis, lymphedema, lymphedematous and fibrous [illegible] and by scleroderma of the major lymphatic areas.

2. Elephantiasis, a complete stasis of filarial obstruction, [illegible] and only after prolonged exposure, has not made its appearance in servicemen. Because they are no longer exposed, it is not expected that it will occur.

3. The course of the disease has been one of gradually decreasing severity, so that now it is only the exceptional individual that shows any difficulty even after heavy infection.

4. There are no proved specific therapeutic agents that can as yet be recommended for use in these mild cases of servicemen. Nonspecific remedies, as cold, heat, local [illegible] to affected parts and protein injections, do not influence the course of infection. It is not unexpected that reactivations will be seen and, if encountered, bed rest for a few days is in itself considered adequate treatment.

5. There is no evidence to support that filariasis will be able to spread from servicemen to the community regardless of their mode of living. This plus the belief that the infection will have no permanent disabling effects justifies the decision to release men with filaria as from military service.

## CORONARY OCCLUSION IN NEGROES

WILLIAM A. BUTTLE, M.D.
Louisville, Ky.

I am unable to find in the literature a description of the clinical picture of myocardial infarction in the Negro. The diagnosis is rarely made clinically. Hence it is my purpose to describe the clinical characteristics of myocardial infarction in the Negro, to indicate that the disease is as common in the Negro as it is in white persons of comparable age groups and to emphasize that the diagnosis is obscured in the Negro only because dyspnea, the chief complaint and pain is absent.

[illegible] I can find no evidence to support the belief that the Negro does not feel pain as well as the white person. I offer as an explanation for the absence of angina in the Negro the fact that he develops hypertension much earlier than the white person and probably thereby obtains [illegible] collateral circulation.

Reports from certain hospitals in Atlanta, Ga., [illegible] state that the [illegible] Negro was [illegible] average [illegible] period [illegible] Negroes [illegible] to [illegible] Negro [illegible] to [illegible] Negro [illegible] to [illegible] Negro

Burch and Voorhies,[3] writing from the same hospital, report that antemortem diagnosis of coronary occlusion in the Negro was made only twice in five years

Hypertension was much more common and much more severe among the Negroes than among the white patients The Negroes' hearts were larger on chest x-ray and heavier at autopsy (table 4)

I was unable to determine the duration of hypertension among the cases, but it seems likely that the Negroes had had hypertension ten or fifteen years longer on the average than the white patients This I infer from statistics based on 53,563 admissions to the Tennessee Coal Iron and Railway Hospital in Fairfield, Ala, which shows the incidence of hypertension to be much higher in young Negroes than in young white persons [10] Other writers have come to similar conclusions [11]

The myocardial infarctions in all the cases included in my series resulted from occlusion of arteriosclerotic coronary arteries Syphilitic aortitis was present in 4 of the Negroes but did not involve the coronary ostia

I am interested in explaining the absence of pain during coronary occlusion in the Negro The rarity of angina in the Negro is well known and is commonly ascribed to lack of stress or to inability of the Negro to feel or to express pain [12] Libman found that 70 per cent of white persons but only 10 per cent of American

Indians were sensitive to styloid pressure He inferred that racial differences in pain sensitivity exist and this might explain the absence of angina in the Negro [13] His articles did not record any use of the test on Negroes I used the test on 100 random patients in white wards and 100 random patients in Negro wards and found 66 of the white patients and 67 of the Negroes sensitive

The only comparison of pain thresholds in Negroes and white persons in the medical literature is the work of Chapman and Jones [14] They conclude that the Negroes "had a lower pain perception threshold and reacted more readily than northern Europeans to the pain stimulus" [15]

## CORONARY OCCLUSION IN NEGROES

WILLIAM S HUNTER, M D
Louisville Ky

I am unable to find in the literature a description of the clinical picture of myocardial infarction in the Negro The diagnosis is rarely made clinically Hence it is my purpose to describe the clinical characteristics of myocardial infarction in the Negro, to indicate that the disease is as common in the Negro as it is in white persons of comparable age groups and to emphasize that the diagnosis is obscured in the Negro only because dyspnea is the chief complaint and pain is absent

Because I can find no evidence to support the belief that the Negro does not feel pain as well as the white person, I offer as an explanation for the absence of angina in the Negro the fact that he develops hypertension much earlier than the white person and probably thereby dilates his coronary collateral circulation

Reports from Grady Hospital in Atlanta, Ga, indicate that the diagnosis of coronary occlusion in the Negro was not made clinically during an eighteen month period [1] Only 1 case was diagnosed before death in Washington, D C, in a year [2] At Charity Hospital in New Orleans the diagnosis was made ante mortem only four times in ten years [3] These authors concluded that coronary occlusion was rare in the Negro

However, authors who base their conclusions on combined clinical and autopsy records believe that coronary occlusion in the Negro is not an uncommon condition Thus the ratio of coronary occlusion in white persons and Negroes was found to be 4 to 1 in Charleston, S C,[4] and 3½ to 1 in New Orleans [5]

Studies based solely on autopsy reports show but little difference in incidence in the two races Writers in three cities found the ratio to be 2 to 1,[5] 1½ to 1 [6] and 1½ to 1 [7] It has been suggested [7] that even this slight preponderance in white persons results from the longer life expectancy (ten years) [8] in the white race

### DATA

I have reviewed 1,000 consecutive autopsies on Negroes and 1,000 consecutive autopsies on white patients of the Louisville General Hospital during the past ten years From these I have chosen to study only those cases in which coronary occlusion was the immediate cause of death These patients were taken from all services of the hospital and include all age groups I believe that these findings accurately mirror the incidence of coronary occlusion as a cause of death in the indigent I found 16 Negro and 26 white cases All 16 of the Negro and 18 of the white patients were under 70, a ratio of 1 to 1 1 in the two races

Dyspnea was the outstanding presenting picture in all the Negroes The almost invariable picture was an exacerbation, usually sudden, of decompensation of several years' duration Dyspnea was evident in every case and ankle edema was present in all cases, though to a varying degree No patient had chest pain None was diagnosed clinically

In contrast, over half of the white patients had pain, and with few exceptions these were the only patients in whom the diagnosis was made

In approximately 25 per cent of Negro and 15 per cent of white patients the diagnosis was obscured by the prominence of cerebrovascular accidents or acute psychoses (tables 2 and 3)

I could find no significant difference in the other clinical signs of myocardial infarction in the two racial groups Electrocardiograms were made on 12 of the white and 9 of the Negro patients Of these, 6 of the white patients showed changes definitely diagnostic of myocardial infarction Only 2 of the Negroes showed such diagnostic electrocardiograms, but 6 of the Negroes had tracings suggestive of myocardial infarction Serial electrocardiograms, which might have proved the diagnosis, were not made in these Negroes because they did not appear clinically to have myocardial infarction I have recently seen an electrocardiogram from a Negro which revealed evidence of both anterior and posterior myocardial infarction, auriculoventricular and bundle branch block and pulmonary infarction, all proved at autopsy, so I have no reason to doubt that the electrocardiogram is of potential value in diagnosing myocardial infarction in the Negro

The only article I have found dealing with electrocardiograms in Negroes is a study of 325 Negro and 322 white patients [9] The author concludes that coronary occlusion is nine times as prevalent in white persons I believe, however, that this low incidence of coronary occlusion in Negro electrocardiograms is a reflection of the rarity with which the diagnosis is suspected clinically

he lacks mental stress [17] On the contrary, mental stress is the common explanation for the high incidence of hypertension in the Negro [18] Careful studies indicate a higher incidence of mental disease in the Negro than in white persons in the United States [19]

It is not known why Negroes do not have angina In seeking an explanation one can hardly overlook the striking difference in the sizes of the heart of Negroes and the heart of the white patients dying of coronary occlusion This difference as far as I know has not been mentioned previously The apparent explanation for this discrepancy in heart size is the greater severity and longer duration of the hypertension in the Negro dying of coronary occlusion High blood pressure definitely will increase coronary flow [20] Increasing the diastolic blood pressure from 85 (the average of the white patients whom I have observed) to 125 (the average of the Negro patients) might be expected to increase the flow through the coronary vessels by as much as a liter per minute [21] Such an increase in coronary flow cannot but increase the volume of the collateral vessels

It is possible too that the coronary vasodilatation accompanying peripheral sympathetic nerve vasoconstriction may increase coronary flow In experimental animals sympathetic stimulation alone has tripled coronary flow The more forceful contractions of the heart may, however offset this increase in flow [21]

I do not believe that the anemia found in the Negroes of this series (average red blood count Negro, 3,910,000, white, 4,230,000) is sufficiently severe to have materially increased coronary flow [22]

In concluding his painstaking injections of the coronary arteries in patients dying of coronary occlusion, Blumgart [23] states that adequate collateral coronary circulation is the explanation of "silent" coronary occlusions

### CONCLUSIONS

1 Coronary occlusion is rarely diagnosed before death in the Negro

2 Below the ages of 70, coronary occlusion seems to be as common in the indigent Negro as in the indigent white person

3 Negroes with coronary occlusion rarely have pain but have dyspnea as their outstanding symptom

4 Careful clinical and electrocardiographic examination of Negroes with acute left ventricular failure will reveal many diagnoses of coronary occlusion

5 The long duration of hypertension in the Negro may dilate coronary collateral circulation and account for the fact that Negroes have "silent' coronaries (Blumgart)

### ADDENDUM

Since writing this paper I have seen a Negress with a severe attack of precordial pain radiating down the left arm She had serial electrocardiograms typical of myocardial infarction with $ST_1$ take-off a centimeter above the base line On admission there was no evidence that she had ever had hypertension or decompensation The attack was not fatal

Louisville General Hospital

## ATABRINE AS A CAUSE OF FATAL EXFOLIATIVE DERMATITIS AND HEPATITIS

CAPTAIN CLARENCE M AGRESS
Medical Corps Army of the United States

It is generally believed that, aside from toxic psychosis, atabrine causes almost no serious reactions In May 1941 Bispham [1] reported 49,681 cases of atabrine-treated malaria many of these representing cases in which suppressive therapy was given with long periods of administration Out of these only 38 with toxic reactions were found, consisting of severe headache, abdominal pain, gastrointestinal disturbances, mental depression a few psychoses and a questionable case of blackwater fever Textbooks of tropical diseases minimize the toxicity of atabrine Manson-Bahr and Stitt make little or no mention of possible serious visceral damage and Napier says "We have treated many hundreds of patients with atabrine during the past ten years and in none of them have any serious effects occurred"

In the face of this prevailing opinion at a time when atabrine is being used so extensively it is felt important to present evidence that in a small percentage of cases atabrine is capable of causing serious and even fatal reactions It is emphasized that these are sensitivity reactions, being similar to reactions produced by many other drugs, such as the arsenicals and quinine in an idiosyncratic or sensitized person It is not suggested that atabrine is necessarily a dangerous drug because the cases presented here represent less than a twentieth of 1 per cent of the atabrine-treated malaria in this group

### REPORTED CASE OF SENSITIVITY

No cases of hepatitis and only 1 case of exfoliative dermatitis following atabrine have been found in the literature Noojin and Callaway [2] reported a case in 1942

A white woman aged 45 on her own initiative took 0 1 Gm of atabrine three times daily for five days for chills and fever On the sixth day because of joint pains, headache and weaknesss (but no fever) she consulted a physician, who discovered diabetes gave her insulin and discharged her a week later The following week fever recurred, malarial parasites were discovered in the blood and a second course of atabrine dihydrochloride 0 3 Gm daily for six days (3 3 Gm total) was given A "few days' later she developed pruritus, thickening of the skin, edema and oliguria Her white blood cell count was 18 650, with an eosinophilia of 60 per cent Although no mention of liver damage is made, the total proteins were 3 7 Gm, albumin 1 6 Gm and globulin 2 1 Gm, with a ratio of 0 76 In the course of the disease the patient had a stormy course with generalized oozing and exfoliation Patch tests

1 Bispham W H Am J Trop Med 21 455-459 (May) 1941

2 Noojin R O and Callaway J L North Carolina M J 3 239 240 (May) 1942

to atabrine were positive at the time of the reaction and four months later when the patient had completely recovered, while control tests with insulin, phenobarbital and other drugs were negative

No instances of exfoliative dermatitis due to malaria are on record

### STORAGE AND EXCRETION OF ATABRINE

Many studies on the storage and excretion of atabrine have been made since its introduction Much of the most recent work has not been published All investigators agree that atabrine is excreted in small amounts over a long period Dearborn and his associates [3] showed that the average daily excretion in the urine and feces of dogs over four weeks of daily administration reached a level of less than 4 per cent of the daily dose Maximum concentrations in most tissues were reached in two weeks, and higher tissue levels were attained only with larger doses They concluded that, since after the second week neither elimination nor storage was increased, 96 per cent must be converted to other substances Scudi and his associates [4] in experiments on rats and dogs found the highest concentrations of atabrine in the liver When administration was stopped, decreased concentrations were found in the liver about the eighth day but appreciable amounts were still present two weeks later even after a single dose of the drug Intermediate concentrations were found in the spleen and kidney, from which excretion was even slower All other tissues but bone marrow and the wall of the small intestine showed low concentrations of the drug Since urinary excretion never reaches a high level, elimination is slow It was pointed out that the total urinary output per day did not reflect the size of the dose administered In the bowel, on the other hand, large amounts were excreted and for long periods after the drug was stopped Blood concentrations, like urinary concentrations, after oral or intravenous administration showed no constant relationship to the dose administered and never exceeded 1 mg per hundred cubic centimeters even after large multiple doses When administration of atabrine is stopped, the blood concentrations are maintained for days and the authors suggest that it is slowly liberated from its deposits in the tissues It can be seen that further work is needed to clarify the fate of atabrine in the body, especially with respect to its degradation products

### REPORT OF CASES

Five cases of atabrine toxicity with exfoliative dermatitis and some degree of hepatitis in all, are presented here Only 2 of the patients survived All were followed in hospitals in the India-Burma Theater The last case was studied at a general hospital where careful laboratory studies could be done This case was the last in the series and because of the knowledge gained in the earlier cases and a preceding history of atabrine sensitivity it was regarded as a test case and so managed It will be noted that all the patients were Chinese This may be on the basis of racial idiosyncrasy, because of the indiscriminate and unsupervised, repeated and generous use of this drug so commonly encountered among Chinese soldiers or because of their poor nutrition, which may have lowered their hepatic tolerance None of these reactions occurred during a time when infectious hepatitis was present in other patients Autopsies were performed in all fatal cases by Capt Leon J Tragerman, M C, A U S He also supplied the histologic descriptions

CASE 1.—A man aged 27, Chinese, admitted Sept 28, 1943 gave a history of fever, headache and backache for three days and the smear was positive for Plasmodium falciparum Except for fever of 101.6 F, physical examination was entirely negative Treatment was begun promptly on the day of entry and he was given quinine 10 grains (0.65 Gm) three times a day for two days After two days quinine was stopped and atabrine started 0.1 Gm three times a day He also received phenobarbital Through a nursing error atabrine was stopped after 0.4 Gm was given quinine being used instead His temperature continued elevated at 100-101.6 F On the sixth day with no temperature change there was onset of a scarlatiniform rash beginning on the face and spreading over the body in a few hours The throat while not sore, was injected and there was a fine punctate enanthem on the soft palate Some follicular exudate was present on the tonsils and the posterior cervical nodes were slightly enlarged The spleen and liver were down about 2 cm below the costal margin and were tender A fine furfuraceous scaling was just visible on the forehead By the eighth day the fever rose to 103 F without rigor By this time the rash had become severe and the patient's face was definitely desquamating The face and hands were puffy, and there was a faint icteric tinge to the sclerae The patient had become mentally sluggish and slightly disoriented Urinalysis at this time revealed 3 plus albumin and 2 to 3 granular casts per high power field and a trace of bile but no urobilinogen The white blood cell count was 15,300 with 42 per cent polymorphonuclears 34 per cent lymphocytes and 24 per cent eosinophils Exfoliative dermatitis due to quinine was suspected, and quinine was stopped Atabrine 0.1 Gm three times a day was again started the patient receiving 0.3 Gm more, making 0.7 Gm total dosage He had also received 2.25 grams (15 Gm) of quinine On the ninth day his icterus index was 105 units desquamation was more advanced on the face and beginning on the trunk and he was semistuporous All drugs were stopped fluids were forced and liver extract was given intramuscularly The temperature was only 99 F at this time, and the blood smear was negative for malaria

Two weeks from the date of entry the patient was mentally clear and the urine showed only a trace of bile and urobilinogen, but the icterus index was 90 units The liver was enlarged to 3 cm and the spleen 1.5 cm below the costal margin and both were tender The skin showed generalized fine desquamation even to the palms and soles Therapy consisted in a high carbohydrate, high vitamin diet with added vitamins and daily intramuscular injection of liver extract By the twenty-fifth day, although his temperature remained elevated at 101-102 F the patient had begun to eat and was alert and his icterus index was only 20 units Urobilinogen was now present in the urine in increased amounts up to 1-40 dilution A purulent cough had developed and there was considerable exfoliation, large flakes of skin being shed from the whole body The patient had lost weight, and small lymph nodes were generally palpable through the leathery thickened skin The tongue was slick, and several nosebleeds occurred The liver was now just palpable and only slightly tender The patient continued febrile until the thirty-seventh day, when a frank bilateral basal bronchopneumonia developed and sulfathiazole was given, 4 Gm as a first dose and 1 Gm at four hour intervals At this time also the patient had several bedsores and although the danger of any further drug therapy was recognized the pneumonia was too severe to go untreated Sulfathiazole was stopped on the forty sixth day, the patient having made considerable progress Desquamation was much less, the bedsores were healing, and the patient became fever free and began to gain weight

Three months after entry he was well enough to determine specific drug sensitivity Skin tests with quinine were negative (patch and scratch) but the phenobarbital patch test was positive 0.1 Gm given orally caused in twenty-four hours a rise in temperature to 101.6 F, conjunctivitis, itching and diffuse

erythema of the skin Three days later the patient recovered except for slight flaking around the neck Quinine 0 3 Gm was given two weeks later without ill effect. Because of the lack of reported toxic effects of atabrine and the demonstrated sensitivity to phenobarbital, atabrine was not suspected, the hepatitis being questionably attributed to malaria After further convalescence the patient was discharged four and one-half months after entry

Three months later May 14, 1944, the patient again entered the hospital Ten days previously he had taken one atabrine tablet as prophylaxis against malaria No other medication had been taken since discharge. Within twelve hours after ingestion of the atabrine he noted fever and a generalized rash which he described as resembling measles His skin began to desquamate a few days later Examination showed mild conjunctivitis and generalized mild exfoliation His blood and urine were normal, and convalescence was uneventful Patch tests to acetylsalicylic acid, phenobarbital and sulfathiazole were negative, suggesting that the previous positive test to phenobarbital was a nonspecific response of a hyperreactive skin, but atabrine produced a localized papular eruption beneath the patch. He was discharged after being warned of the danger of future ingestion of atabrine. Several months later it was learned that the patient was well but could not be released from duty for further study

Case 2—A man aged 24, Chinese, was admitted on April 4, 1944 for shrapnel wounds of the arm, groin and back An abscess of the back was drained and he did well until June 17, when he began having epileptiform seizures for which he was given phenobarbital 0 1 Gm three times a day On July 9 a blood smear during a chill revealed malaria, type undetermined and he was started on atabrine. July 11 a generalized maculopapular rash appeared, beginning on the face. The rash was blotchy, faded on pressure and was more apparent over the extensor surfaces and over the proximal rather than the distal extremities The palms were erythematous, the conjunctivas and soft palate were injected and the tongue had a moderate "strawberry" appearance Atabrine and phenobarbital were stopped and after a negative quinine scratch test (as described by Dawson and Garbade) malarial therapy was completed with quinine.

By July 17 the patient's temperature was still 102-104 6 F and the rash had become confluent, involving the flexor surfaces last, and was papulovesicular on the face, with a fine branny scale on the forehead. The tongue had peeled' and was very red, and there was conjunctivitis The nodes were generally enlarged and slightly tender A purulent productive cough had developed, with fine rales in both bases indicative of an early bronchopneumonia Five days later the skin had become leathery and thickened and was exfoliating The patient had become dull and apathetic, with puffy face and eczematoid weeping around the eyes, lips and ears The liver became palpable 2 cm below the costal margin and was tender The basal bronchopneumonia failed to respond to three days' full doses of sulfathiazole which was discontinued Liver extract and vitamin C were given daily parenterally, along with intravenous plasma and fluids Patch tests were difficult to carry out, but atabrine was again positive At the same time negative results were obtained for acetophenetidin, phenobarbital and sulfathiazole

Several leukocyte counts from July 12 to 25 showed a rise from 12 950 to 41,000 per cubic millimeter, with a progressive fall in the polymorphonuclear count from 80 to 39 per cent as a result of a rise of eosinophils from 1 to 44 per cent the monocytes remaining unchanged The urine showed only a trace of albumin

By August 1, twenty two days after the administration of 1 3 Gm of atabrine the patient became icteric and began to bleed from the rectum and fissures about the mouth bile was passed in the urine, and he died after being comatose for several hours

Autopsy showed extensive generalized exfoliation The cardiovascular and gastrointestinal systems were normal The respiratory system showed an old right chronic pleuritis and local bronchiectasis of the right lower lobe The spleen was firm, was three times normal size and had the mahogany color of chronic malaria The kidneys exhibited rather severe parenchymatous degeneration The liver weighed 2,000 Gm and was smooth and a mottled yellow-brown The cut surfaces were soft and of similar color, with bright yellow blotches obscuring the markings in many areas Postmortem urine tested with amyl alcohol for atabrine was positive (Bile, however, may give a false positive reaction)

Microscopic study of the liver showed severe fatty changes, disorganization of architecture, severe hepatocellular degeneration and, in the areas, apparent necrosis Mild lymphocytic and plasma cell periportal infiltration was noted, and no regenerative changes or connective tissue proliferation occurred The skin sections showed varying mixtures of inflammatory and degenerative changes with desquamation No other pertinent histologic changes were noted The cause of death was listed as severe acute hepatitis, generalized, exfoliative dermatitis and acute pulmonary edema

Case 3—A soldier aged 25, Chinese, was admitted as a casualty on June 8, 1944, two days after suffering a rifle wound on the left leg Examination showed a compound fracture of the left tibia No other disease was present. The wound was debrided, a cast applied and the patient started on sulfathiazole 4 Gm initially and 1 Gm every four hours and continued on this dosage until June 23 He was also given the usual suppressive atabrine treatment of 0 1 Gm daily He had a secondary hemorrhage on June 17 necessitating exploration and arterial ligation After the cast was reapplied his temperature began to range between 101 and 102 F, and despite negative malarial smears and the suppressive atabrine he was begun on therapeutic doses of atabrine, receiving a full course and then continued on 0 1 Gm daily On June 27, on application of a new cast, a local sequestrum was noted. By July 7 the fever had changed to a definitely septic type and at this time a medical consultant noticed jaundice and exfoliative dermatitis, which had already been present several days, and atabrine was stopped after a total dose of 3 9 Gm The patient was pale, very weak but rational and had jaundice, especially of the scleras and palms Slight conjunctivitis and a slick atrophied tongue were present, and there were crepitant rales in the left base. The spleen was not felt, but the liver was enlarged 2 cm below the costal margin but not tender There was generalized shotty lymphadenopathy and the skin was strikingly thickened, leathery and desquamating

Laboratory study showed a red blood cell count of 2,500,000 per cubic millimeter and a white blood cell count of 11 400 per cubic millimeter with a normal differential The urine contained bile but no increased urobilinogen on three tests The icterus index was 100 units Widal and Weil-Felix agglutination tests were negative, as was an x-ray of the chest. Stool specimens showed only Ascaris ova Blood cultures on July 7 and 18 were positive for Staphylococcus aureus but the coagulase test was negative, indicating doubtful significance Because of slight stiffness of the neck a spinal puncture was performed but the fluid was normal except for the presence of 25 lymphocytes per cubic millimeter

The patient also received large doses of parenteral vitamins and liver and plasma without effect He became more jaundiced and soon developed bronchopneumonia for which sulfathiazole was ineffectual His skin was thought too irritated to attempt patch testing, although subsequent work suggests that it may be done even in this stage By July 19 he was delirious and died on the following day, forty one days after entry

Autopsy revealed an entirely normal cardiovascular system and a gastrointestinal system which showed only ascariasis The spleen was normal in size and appearance, but the lymph nodes were generally slightly enlarged and bile stained There was fairly extensive bronchopneumonia in the lower lobe of the left lung The liver weighed 1,040 Gm. and was two-thirds normal size Its capsule was wrinkled and the cut surface softer than normal presenting a diffuse rich yellow to bright tan color with many pin point red zones and complete loss of normal markings The spleen weighed 140 Gm. and showed normal markings The kidneys were slightly enlarged and showed cloudy swelling and bile staining The musculoskeletal

system was not examined and the skin was leathery and desquamating There was no evidence in the viscera of septicopyemia

Microscopic sections of the liver showed severe hepatocellular degeneration, with areas of necrosis No inflammatory or regenerative changes were noted The skin sections showed atrophy and desquamation, with little inflammatory change No striking or significant changes were noted in sections of other organs

The cause of death was assigned to severe acute hepatitis and exfoliative dermatitis, with chronic sepsis from compound fracture and osteomyelitis of the tibia as contributory cause

CASE 4—A man aged 36, Chinese, entered the hospital on July 15 for bilateral extensive shrapnel wounds debrided earlier the same day at a forward hospital He was in shock but responded to plasma and was given tetanus antitoxin and sulfadiazine He improved slowly and was afebrile by July 23 A delayed primary suture and skin grafting were done July 26 He did well until August 10, when he began to have an irregular fever His white blood cell count was 4,500 per cubic millimeter, but a blood smear showed no malarial parasites However, he was given atabrine from August 10 to 19 (2 8 Gm) without response There were no complaints beyond a mild cough

A medical consultant saw the patient on August 19 and found slight generalized lymphadenopathy, slight enlargement of the spleen and fever The following day a maculopapular rash appeared on the trunk and proximal extremities and the diagnosis of scrub typhus was suggested although there was no bite and the patient had been in the hospital for a month The Weil-Felix test was negative, however The white blood cell count at this time was 15,050 per cubic millimeter, with 36 per cent lymphocytes

The rash faded in four days, the fever subsided and a follow up Weil-Felix test was again negative On September 3 the patient again had a rise in temperature and this time the malarial smear was found positive, the type undetermined Because the rash followed atabrine, it was thought safer to treat the patient with quinine, of which he received 2 Gm daily

The following day it was noted that the patient looked slightly jaundiced, and he complained of generalized itching His skin appeared dry, with prominence of follicles resembling keratosis follicularis The spleen but not the liver was palpable and tender

He continued to have fever every other day, and since he stated that he had never taken quinine before and the quinine scratch test was negative, the drug was continued By September 6 he was deeply jaundiced, the keratotic follicles now contained a thin milky fluid, and there was early desquamation over the face. Because of the preceding experience, atabrine was suspected and inquiry revealed that the patient had been receiving, irregularly since entry as a part of a preventive malarial policy, 0 1 Gm of atabrine daily No other drugs had been given. It was roughly estimated that the patient had received 4 Gm in addition to the course of atabrine administered, making a total of 6 8 Gm The drug was stopped and supportive therapy given in the form of intravenous fluids and plasma, parenteral liver extract and vitamin C Laboratory study showed that the urine contained bile, urobilinogen up to a 1 100 dilution and albumin The white blood cell count was 7,700 per cubic millimeter, with 70 per cent polymorphonuclears The red blood cell count was 3,500,000 per cubic millimeter, the icterus index 200 units, serum protein total 5 Gm per hundred cubic centimeters, albumin 2 6, globulin 2 4 Two patch tests with atabrine were found positive in twenty-four hours, manifested by itching, scaling and a papular eruption Controls done with phenobarbital and sulfathiazole were negative. The patient went downhill rapidly, the exfoliation increasing He died in coma on September 15

Autopsy was performed the following day Aside from early left bronchopneumonia and chronic malarial hyperplasia of the spleen, which was three times normal size, the skin and liver were the only organs showing remarkable changes The kidneys were somewhat swollen and deeply bile stained and the axillary and periportal nodes were moderately enlarged and soft. The skin was darkened and showed widespread fine exfoliation without large sloughs The areas of the old atabrine patch tests were both plainly visible, the first one marked by a crust, and the one done twenty-four hours before death showed an actual slough, the control area with sulfathiazole showing no reaction The liver was less than two-thirds normal size and weighed 900 Gm The capsule was wrinkled and the cut surface flabby and of a striking mottled pink to red, entirely obscuring the markings The biliary tract was normal throughout The duodenal mucosa was edematous

Microscopic study of the liver revealed severe diffuse necrosis without evidence of regeneration In addition, interlobular portal radicles are increased in number in some areas, and many of the vessels contained poorly stained ova morphologically compatible with schistosoma japonicum No cirrhotic changes were present Section of the spleen showed changes compatible with chronic malaria Section of the duodenal wall showed numerous ova similar to those seen in the liver mostly in the submucosa and associated with mild inflammatory changes

The cause of death was listed as acute hepatic necrosis and exfoliative dermatitis with chronic malaria, schistosomal infestation of liver and duodenum, and bronchopneumonia as contributory causes

CASE 5—A man aged 31, Chinese, admitted March 5, 1945, had entered the Chinese army as a private in 1930 He fought in over a hundred battles including the battle of Changsha, and was wounded four times He came to India, landing in Dinjan in August 1943, whence he went to Ramgarh and stayed until March 1944, training infantry troops and attaining the rank of captain In April he took part in the battle of Myitkyina On May 26, 1944 he was wounded by a machine gun bullet, which entered the base of the neck on the left side, traversed the soft tissues, pierced the spinous process of the third thoracic vertebra and emerged at the angle of the right scapula Both legs were paralyzed, and he lost sensation from the nipple level down A moderate pleural effusion developed on the left On May 29 a suprapubic cystostomy with insertion of a Pezzar catheter was performed preceding a laminectomy on June 8 for pressure on the spinal cord at the third thoracic vertebra He was febrile for two weeks postoperatively but gradually recovered some ability to move his feet and flex his knees He was transferred to the 14th Evacuation Hospital from the 20th General Hospital and on admission there his general physical condition except for the cord damage was good, and no other abnormality was noted The cystostomy with indwelling catheter was functioning satisfactorily The patient remembered no serious illness in the past He had gonorrhea at the age of 19 and although he had noted no primary lesion he received twenty arm injections of a yellow liquid called 914, without reaction In 1931 in China he had malaria treated with quinine He had had no malaria in Burma or India There was no history of any drug sensitivities and the family history was irrelevant

The patient first began prophylactic atabrine in April 1944, at which time he took a 0 1 gram tablet daily for three weeks (approximately 2 Gm) There was no reaction of any kind at this time From May 1 to 18 he took none but again resumed atabrine daily for the next ten days (1 Gm) At this time he was wounded and he had no further atabrine until his transfer to the 14th Evacuation Hospital after surgical treatment at the 20th General Hospital, when on October 2 it was again given in 0 1 gram daily doses until November 21 (5 1 Gm) Following ingestion of the first tablet he had unexplained fever to 101 F for two days but no further reaction until November 20, when it again rose to 101 4 F and the following day atabrine was stopped With the fever there was a general cutaneous reaction described as a punctate maculopapular rash, confluent over the forearms, upper sternum and sacrolumbar area, involving all parts of the body, including the palms and soles The rash faded on pressure except over the sacral region, where it was hemorrhagic. There was conjunctival injection, fine desquamation around the lips and a barely palpable splenomegaly, but no enlargement of the liver was noted He had an irregular spiking temperature from 104-105 F, beginning to decline after a week, then to 102 F for four days, then 103 6 F for four days and a final drop by crisis to normal on the fourteenth day The patient was severely ill during the first seven days of fever, with generalized aching and sore throat. The dermatitis became more severe,

erythema of the skin Three days later the patient recovered except for slight flaking around the neck. Quinine 0 3 Gm was given two weeks later without ill effect. Because of the lack of reported toxic effects of atabrine and the demonstrated sensitivity to phenobarbital, atabrine was not suspected, the hepatitis being questionably attributed to malaria After further convalescence the patient was discharged four and one-half months after entry

Three months later May 14 1944, the patient again entered the hospital Ten days previously he had taken one atabrine tablet as prophylaxis against malaria No other medication had been taken since discharge Within twelve hours after ingestion of the atabrine he noted fever and a generalized rash which he described as resembling measles His skin began to desquamate a few days later Examination showed mild conjunctivitis and generalized mild exfoliation His blood and urine were normal and convalescence was uneventful Patch tests to acetylsalicylic acid, phenobarbital and sulfathiazole were negative, suggesting that the previous positive test to phenobarbital was a nonspecific response of a hyperreactive skin, but atabrine produced a localized papular eruption beneath the patch He was discharged after being warned of the danger of future ingestion of atabrine Several months later it was learned that the patient was well but could not be released from duty for further study

Case 2—A man aged 24 Chinese, was admitted on April 4, 1944 for shrapnel wounds of the arm, groin and back An abscess of the back was drained and he did well until June 17, when he began having epileptiform seizures for which he was given phenobarbital 0 1 Gm three times a day On July 9 a blood smear during a chill revealed malaria type undetermined, and he was started on atabrine. July 11 a generalized maculopapular rash appeared, beginning on the face The rash was blotchy, faded on pressure and was more apparent over the extensor surfaces and over the proximal rather than the distal extremities The palms were erythematous, the conjunctivas and soft palate were injected and the tongue had a moderate "strawberry" appearance Atabrine and phenobarbital were stopped, and after a negative quinine scratch test (as described by Dawson and Garbade) malarial therapy was completed with quinine

By July 17 the patient's temperature was still 102 104 6 F and the rash had become confluent, involving the flexor surfaces last and was papulovesicular on the face with a fine branny scale on the forehead The tongue had 'peeled' and was very red, and there was conjunctivitis The nodes were generally enlarged and slightly tender A purulent productive cough had developed, with fine rales in both bases indicative of an early bronchopneumonia Five days later the skin had become leathery and thickened and was exfoliating The patient had become dull and apathetic, with puffy face and eczematoid weeping around the eyes, lips and ears The liver became palpable 2 cm below the costal margin and was tender The basal bronchopneumonia failed to respond to three days' full doses of sulfathiazole which was discontinued Liver extract and vitamin C were given daily parenterally, along with intravenous plasma and fluids Patch tests were difficult to carry out, but atabrine was again positive At the same time negative results were obtained for acetophenetidin, phenobarbital and sulfathiazole

Several leukocyte counts from July 12 to 25 showed a rise from 12 950 to 41,000 per cubic millimeter, with a progressive fall in the polymorphonuclear count from 80 to 39 per cent as a result of a rise of eosinophils from 1 to 44 per cent, the monocytes remaining unchanged The urine showed only a trace of albumin

By August 1 twenty two days after the administration of 1 3 Gm of atabrine, the patient became icteric and began to bleed from the rectum and fissures about the mouth bile was passed in the urine and he died after being comatose for several hours

Autopsy showed extensive generalized exfoliation The cardiovascular and gastrointestinal systems were normal The respiratory system showed an old right chronic pleuritis and local bronchiectasis of the right lower lobe The spleen was firm, was three times normal size and had the mahogany color of chronic malaria The kidneys exhibited rather severe parenchymatous degeneration The liver weighed 2,000 Gm and was smooth and a mottled yellow-brown The cut surfaces were soft and of similar color, with bright yellow blotches obscuring the markings in many areas Postmortem urine tested with amyl alcohol for atabrine was positive (Bile, however, may give a false positive reaction)

Microscopic study of the liver showed severe fatty changes, disorganization of architecture, severe hepatocellular degeneration and, in the areas, apparent necrosis Mild lymphocytic and plasma cell periportal infiltration was noted, and no regenerative changes or connective tissue proliferation occurred The skin sections showed varying mixtures of inflammatory and degenerative changes with desquamation No other pertinent histologic changes were noted The cause of death was listed as severe acute hepatitis, generalized, exfoliative dermatitis and acute pulmonary edema

Case 3—A soldier aged 25, Chinese, was admitted as a casualty on June 8, 1944, two days after suffering a rifle wound on the left leg Examination showed a compound fracture of the left tibia No other disease was present The wound was debrided, a cast applied and the patient started on sulfathiazole 4 Gm initially and 1 Gm every four hours and continued on this dosage until June 23 He was also given the usual suppressive atabrine treatment of 0 1 Gm daily He had a secondary hemorrhage on June 17 necessitating exploration and arterial ligation After the cast was reapplied his temperature began to range between 101 and 102 F, and despite negative malarial smears and the suppressive atabrine he was begun on therapeutic doses of atabrine, receiving a full course and then continued on 0 1 Gm daily On June 27, on application of a new cast, a local sequestrum was noted. By July 7 the fever had changed to a definitely septic type and at this time a medical consultant noticed jaundice and exfoliative dermatitis, which had already been present several days, and atabrine was stopped after a total dose of 3 9 Gm The patient was pale, very weak, but rational, and had jaundice, especially of the scleras and palms Slight conjunctivitis and a slick atrophied tongue were present, and there were crepitant rales in the left base. The spleen was not felt, but the liver was enlarged 2 cm below the costal margin but not tender There was generalized shotty lymphadenopathy and the skin was strikingly thickened, leathery and desquamating

Laboratory study showed a red blood cell count of 2,500,000 per cubic millimeter and a white blood cell count of 11,400 per cubic millimeter with a normal differential The urine contained bile but no increased urobilinogen on three tests The icterus index was 100 units Widal and Weil-Felix agglutination tests were negative, as was an x ray of the chest. Stool specimens showed only Ascaris ova Blood cultures on July 7 and 18 were positive for Staphylococcus aureus but the coagulase test was negative, indicating doubtful significance Because of slight stiffness of the neck a spinal puncture was performed but the fluid was normal except for the presence of 25 lymphocytes per cubic millimeter

The patient also received large doses of parenteral vitamins and liver and plasma without effect He became more jaundiced and soon developed bronchopneumonia for which sulfathiazole was ineffectual His skin was thought too irritated to attempt patch testing, although subsequent work suggests that it may be done even in this stage By July 19 he was delirious and died on the following day, forty-one days after entry

Autopsy revealed an entirely normal cardiovascular system and a gastrointestinal system which showed only ascariasis The spleen was normal in size and appearance, but the lymph nodes were generally slightly enlarged and bile stained There was fairly extensive bronchopneumonia in the lower lobe of the left lung The liver weighed 1,040 Gm and was two-thirds normal size Its capsule was wrinkled and the cut surface softer than normal, presenting a diffuse rich yellow to bright tan color with many pin point red zones and complete loss of normal markings The spleen weighed 140 Gm and showed normal markings The kidneys were slightly enlarged and showed cloudy swelling and bile staining The musculoskeletal

system was not examined and the skin was leathery and desquamating There was no evidence in the viscera of septicopyemia

Microscopic sections of the liver showed severe hepatocellular degeneration, with areas of necrosis No inflammatory or regenerative changes were noted The skin sections showed atrophy and desquamation, with little inflammatory change No striking or significant changes were noted in sections of other organs

The cause of death was assigned to severe acute hepatitis and exfoliative dermatitis, with chronic sepsis from compound fracture and osteomyelitis of the tibia as contributory cause.

CASE 4.—A man aged 36, Chinese, entered the hospital on July 15 for bilateral extensive shrapnel wounds debrided earlier the same day at a forward hospital He was in shock but responded to plasma and was given tetanus antitoxin and sulfadiazine He improved slowly and was afebrile by July 23 A delayed primary suture and skin grafting were done July 26 He did well until August 10 when he began to have an irregular fever His white blood cell count was 4,500 per cubic millimeter, but a blood smear showed no malarial parasites However, he was given atabrine from August 10 to 19 (2 8 Gm) without response There were no complaints beyond a mild cough

A medical consultant saw the patient on August 19 and found slight generalized lymphadenopathy, slight enlargement of the spleen and fever The following day a maculopapular rash appeared on the trunk and proximal extremities and the diagnosis of scrub typhus was suggested, although there was no bite and the patient had been in the hospital for a month The Weil-Felix test was negative however The white blood cell count at this time was 15,050 per cubic millimeter, with 36 per cent lymphocytes

The rash faded in four days, the fever subsided and a follow-up Weil-Felix test was again negative On September 3 the patient again had a rise in temperature and this time the malarial smear was found positive, the type undetermined Because the rash followed atabrine, it was thought safer to treat the patient with quinine, of which he received 2 Gm daily

The following day it was noted that the patient looked slightly jaundiced, and he complained of generalized itching His skin appeared dry, with prominence of follicles resembling keratosis follicularis The spleen but not the liver was palpable and tender

He continued to have fever every other day, and since he stated that he had never taken quinine before and the quinine scratch test was negative, the drug was continued. By September 6 he was deeply jaundiced, the keratotic follicles now contained a thin milky fluid, and there was early desquamation over the face. Because of the preceding experience, atabrine was suspected and inquiry revealed that the patient had been receiving, irregularly since entry as a part of a preventive malarial policy, 0 1 Gm of atabrine daily No other drugs had been given. It was roughly estimated that the patient had received 4 Gm in addition to the course of atabrine administered, making a total of 6 8 Gm The drug was stopped and supportive therapy given in the form of intravenous fluids and plasma, parenteral liver extract and vitamin C Laboratory study showed that the urine contained bile, urobilinogen up to a 1 100 dilution and albumin The white blood cell count was 7,700 per cubic millimeter, with 70 per cent polymorphonuclears The red blood cell count was 3,500 000 per cubic millimeter, the icterus index 200 units, serum protein total 5 Gm. per hundred cubic centimeters, albumin 2 6, globulin 2 4 Two patch tests with atabrine were found positive in twenty-four hours manifested by itching scaling and a papular eruption Controls done with phenobarbital and sulfathiazole were negative. The patient went downhill rapidly, the exfoliation increasing He died in coma on September 15

Autopsy was performed the following day Aside from early left bronchopneumonia and chronic malarial hyperplasia of the spleen, which was three times normal size the skin and liver were the only organs showing remarkable changes The kidneys were somewhat swollen and deeply bile stained, and the axillary and periportal nodes were moderately enlarged and soft The skin was darkened and showed widespread fine exfoliation without large sloughs The areas of the old atabrine patch tests were both plainly visible, the first one marked by a crust, and the one done twenty-four hours before death showed an actual slough, the control area with sulfathiazole showing no reaction The liver was less than two-thirds normal size and weighed 900 Gm The capsule was wrinkled and the cut surface flabby and of a striking mottled pink to red, entirely obscuring the markings The biliary tract was normal throughout The duodenal mucosa was edematous

Microscopic study of the liver revealed severe diffuse necrosis without evidence of regeneration In addition, interlobular portal radicles are increased in number in some areas, and many of the vessels contained poorly stained ova morphologically compatible with schistosoma japonicum. No cirrhotic changes were present Section of the spleen showed changes compatible with chronic malaria Section of the duodenal wall showed numerous ova similar to those seen in the liver mostly in the submucosa and associated with mild inflammatory changes

The cause of death was listed as acute hepatic necrosis and exfoliative dermatitis with chronic malaria, schistosomal infestation of liver and duodenum, and bronchopneumonia as contributory causes

CASE 5.—A man aged 31, Chinese, admitted March 5, 1945 had entered the Chinese army as a private in 1930 He fought in over a hundred battles, including the battle of Changsha, and was wounded four times He came to India, landing in Dinjan in August 1943 whence he went to Ramgarh and stayed until March 1944, training infantry troops and attaining the rank of captain In April he took part in the battle of Myitkyina On May 26, 1944 he was wounded by a machine gun bullet which entered the base of the neck on the left side traversed the soft tissues, pierced the spinous process of the third thoracic vertebra and emerged at the angle of the right scapula Both legs were paralyzed, and he lost sensation from the nipple level down A moderate pleural effusion developed on the left On May 29 a suprapubic cystostomy with insertion of a Pezzar catheter was performed preceding a laminectomy on June 8 for pressure on the spinal cord at the third thoracic vertebra He was febrile for two weeks postoperatively but gradually recovered some ability to move his feet and flex his knees He was transferred to the 14th Evacuation Hospital from the 20th General Hospital and on admission there his general physical condition except for the cord damage was good and no other abnormality was noted The cystostomy with indwelling catheter was functioning satisfactorily The patient remembered no serious illness in the past He had gonorrhea at the age of 19 and although he had noted no primary lesion he received twenty arm injections of a yellow liquid called 914, without reaction In 1931 in China he had malaria treated with quinine He had had no malaria in Burma or India There was no history of any drug sensitivities and the family history was irrelevant.

The patient first began prophylactic atabrine in April 1944 at which time he took a 0 1 gram tablet daily for three weeks (approximately 2 Gm) There was no reaction of any kind at this time From May 1 to 18 he took none but again resumed atabrine daily for the next ten days (1 Gm) At this time he was wounded and he had no further atabrine until his transfer to the 14th Evacuation Hospital after surgical treatment at the 20th General Hospital when on October 2 it was again given in 0 1 gram daily doses until November 21 (5 1 Gm) Following ingestion of the first tablet he had unexplained fever to 101 F for two days but no further reaction until November 20, when it again rose to 101 4 F and the following day atabrine was stopped With the fever there was a general cutaneous reaction described as a punctate maculopapular rash, confluent over the forearms, upper sternum and sacrolumbar area, involving all parts of the body, including the palms and soles The rash faded on pressure except over the sacral region, where it was hemorrhagic. There was conjunctival injection fine desquamation around the lips and a barely palpable splenomegaly, but no enlargement of the liver was noted He had an irregular spiking temperature from 104-105 F beginning to decline after a week, then to 102 F for four days, then 103 6 F for four days and a final drop by crisis to normal on the fourteenth day The patient was severely ill during the first seven days of fever with generalized aching and sore throat. The dermatitis became more severe,

involving the buccal mucosa, becoming confluent over the trunk and assuming a violaceous hue. Serous exudation and crusting appeared about the ears and nasolabial folds, and a large flaky desquamation appeared over the scalp, forehead and face. Finer scaling was noted over the sternal and sacral areas, while other regions still showed a macular violaceous eruption. Unfortunately no photographs were taken. The palms and soles lost the original eruptive pattern and exhibited a diffuse pink blush. The weeping and crusting dried up and peeled by December 28. The exfoliative phase terminated after a period of fine desquamation, leaving the skin very shiny, thin and with a silky texture. Pruritus was moderate throughout. There were no general abnormalities other than enlargement of the liver 5 cm. below the costal margin by the ninth day of fever (November 28) and also well below the inner costal margin to the midepigastric level. It was not tender. The spleen became just palpable.

*Laboratory work during this phase was as follows:*

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Nov. 23 | RBC 3,900,000 | Hgb 75% | WBC 6,900 | P-53 | L-27 | M 7 | E 13 | |
| Nov. 25 | | | WBC 43,600 | P-50 | L-38 | M 10 | E 7 | Schilling to left |
| Nov. 27 | | | WBC 11,000 | P-46 | L-39 | M-8 | E 7 | |
| Nov. 28 | RBC 2,000,000 | Hgb 60% | WBC 13,000 | P-48 | L-11 | M 16 | E 25 | Platelets normal |

The count gradually dropped to normal through December, the last being:

Dec. 19 WBC 5,000 P 69 L-27 M 3 E-0 B 1

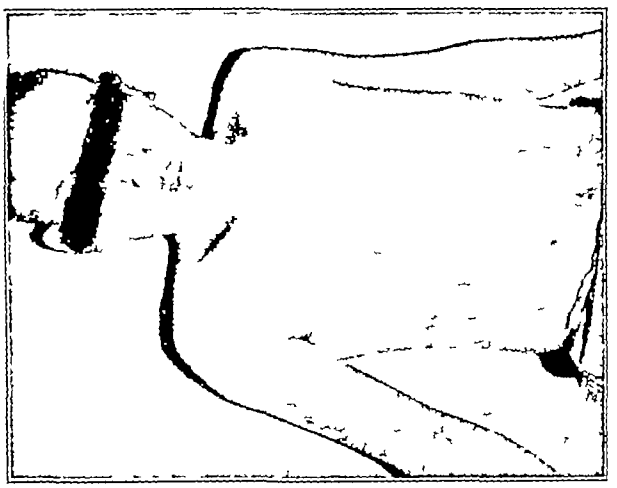

Fig. 1 (case 5).—Appearance of body before atabrine was administered.

The urine on several occasions showed a trace of albumin and a few pus cells but no bile. The icterus index was 10, but the atabrine level could not be done. Therapy consisted of intravenous fluids, high sugar intake, cod liver oil and vitamin C 75 mg. three times a day and the prohibition of all other medications. The patient remained afebrile except for occasional rises in temperature to 100.6 F. for a day or two. By December 28 he was considered recovered and was allowed out in the sun in a wheel chair several hours during the day with no subsequent flare due to light exposure.

On December 30 suppressive atabrine was ordered for all patients, and this patient received 0.1 Gm. on two successive days (0.2 Gm.). There was no febrile reaction, but forty-eight hours later a weeping eczematous eruption appeared over the entire body requiring about eight days to clear. No laboratory studies were done except urinalysis, which was negative. In reviewing the record it was found that the patient had taken ammonium chloride, methenamine, boric acid and acriflavine bladder irrigations, acetylsalicylic acid, magnesium sulfate, morphine sulfate, sodium amytal, sulfadiazine, phenobarbital (total 0.9 Gm.) and atabrine (total 5.1 Gm. in October and November and 0.2 Gm. on December 30). These drugs had been administered at various times between September 22 and November 21. On December 11 the patient was given 0.1 Gm. of phenobarbital without reaction and on Feb. 1, 1945 he was given 13 Gm. of sulfadiazine without reaction. On February 7 a patch test with a suspension of atabrine in water in the form of a paste was performed on the forearm and left for forty-eight hours. A similar patch with an intravenous preparation was applied to the opposite arm. In forty-eight hours there were severe local reactions showing papules, vesicles rapidly becoming

Fig. 2 (case 5).—Closer view.

bullae and subsequent weeping, crusting, itching then exfoliation and finally lichenification over a period of ten days.

Through the courtesy of Lieut. Col. Philip G. C. Bishop of the 14th Evacuation Hospital, under whom the foregoing studies were carried out, the patient was referred back to the 20th General Hospital for further study on March 5. Physical examination at this time showed a spastic paraplegia with anesthesia below the nipple line, a suprapubic cystostomy scar with a small urinary fistula, incontinence of urine, and the old wound scar at the nape of the neck. The liver and spleen were not enlarged, and there was no adenopathy. The skin was smooth, shiny and not scaling, with pigmented roughened areas over the sites of the forearm patch tests. There was a macular fungous infection around the umbilicus, which cleared promptly on therapy. It was realized that this was an important test case, and a definite program of investigation was followed. The patient was bedridden, so that it was easy to keep him inside and eliminate the sunlight factor. Medications of all kinds were prohibited, and the only treatment he received was bladder irrigations with boric acid. Photographs of the entire body and tongue were taken for future comparison (figs. 1, 2 and 3). A daily temperature record was kept and the following preliminary laboratory studies were done:

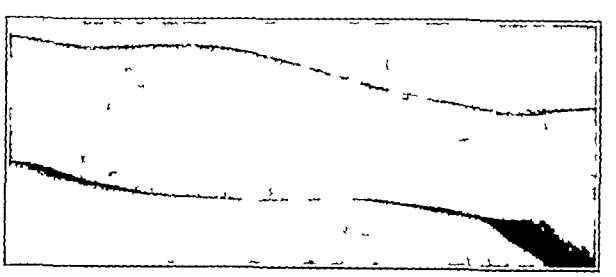

Fig. 3 (case 5).—Skin of left arm before medication.

Chest x-ray. Slight increased prominence of the lung markings bilaterally, probably due to hypoventilation. The left dome of the diaphragm was elevated because of enlarged spleen.

Urine. Many white and red blood cells, specific gravity 1.021.

Blood count. Hemoglobin 14.5 Gm., white blood cells 5,100, polymorphonuclears 62, lymphocytes 31, monocytes 3, eosinophils 4. The Kahn blood test was negative. The direct van den Bergh negative, indirect insufficient quantity.

Glucose tolerance Fasting 113, in fifteen minutes 135, in thirty minutes 214, in sixty minutes 217, in 120 minutes 183 mg per hundred cubic centimeters

Sulfobromophthalein 0 per cent retention

Icterus index 6.

Serum protein Total, 7 2 Gm , albumin globulin ratio, 4 11/3 09, or 1 3

Blood atabrine levels, followed at weekly intervals, were, March 7, 8 micrograms per liter, March 15, 9 micrograms per liter, March 26, 4 micrograms per liter (It is difficult to explain these levels because the patient denied taking any atabrine since December 30 He knew of the danger of atabrine and it was only with great difficulty that he could be made to take a test dose later on The levels were run by a man skilled in the use of the photofluorometer and doing many of these determinations daily It appears that this patient had an abnormally long retention of atabrine in some way connected with his sensitivity, unless the method was unreliable It is equally difficult to explain the rise in blood level from 4 to 12 micrograms per liter on only 0 25 Gm of atabrine )

On March 15 he was patch tested on the forearms, the moistened powder of acetylsalicylic acid phenobarbital, sulfadiazine sulfathiazole and sodium amytal being used, all read at forty-eight hours and all showing no reaction

From March 18 to 23 acetylsalicylic acid 0 6 Gm., sodium amytal 0 1 Gm, sulfadiazine 1 Gm., sulfathiazole 1 Gm and phenobarbital 1 gram (0 06 Gm ) were administered by mouth

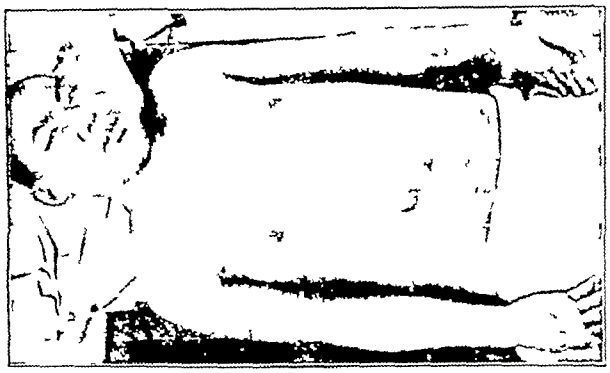

Fig 4 (case 5) —Appearance of patient seventy two hours after original test dose of atabrine. Total dose 0 25 Gm Notice flare of patch test areas on forearms

with no reaction except a rise in temperature to 99 4 F when sulfathiazole was given The dose of sulfathiazole was then repeated without any febrile reaction Then patch tests were made of morphine sulfate 1 per cent solution, ammonium chloride 3 per cent solution, methenamine powder and magnesium sulfate crystals all read at forty-eight hours and all negative.

From March 28 to April 1 these substances were given internally morphine sulfate ¼ grain (0 016 Gm ) subcutaneously, methenamine 0 6 Gm , ammonium chloride 1 Gm , and magnesium sulfate ½ ounce. There was no reaction.

Atabrine patch tests were then carried out by saturating a small gauze square with the appropriate dilution of atabrine dihydrochloride and reading the test both at twenty-four and at forty-eight hour intervals

Atabrine 0 001 per cent, no reaction.

Atabrine 0 01 per cent, some itching Questionable fine papules

Atabrine paste made of intravenous powder moistened with water, approximately 0 04 per cent. At twenty-four hours, definite fine papules at site of patch with severe itching

Atabrine was then administered by mouth

April 5, atabrine 0 05 Gm , twenty-four hours later no symptoms fever or dermatitis

April 6, atabrine 0 10 Gm., twenty-four hours later patient complained of slight itching

The patch test area now showed an eczematoid reaction, but the area in contact with the tape also showed a similar although weaker reaction Previously there had been no tape reaction.

April 7 atabrine 0 10 Gm was given At this time the old patch test areas done at the previous hospital flared on both forearms, and the recent patch test areas with the more dilute

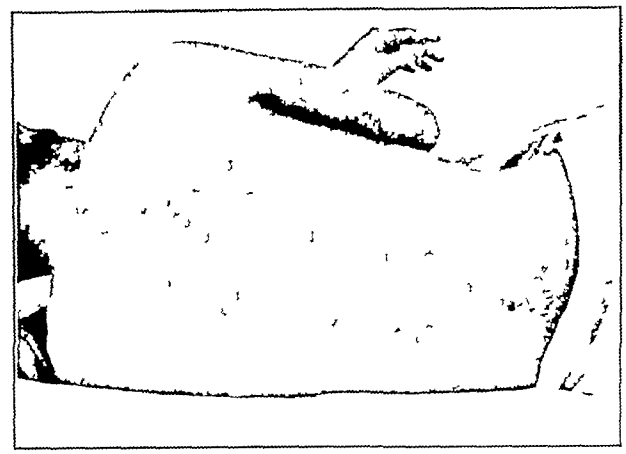

Fig 5 (case 5) —Back of patient seventy two hours after original test dose

solutions, including the one that was negative at 0 001 per cent dilution, developed eczematoid reactions No further atabrine was given, this making a total dose of 0.25 Gm

On the morning of April 8, about seventy-two hours after the original test dose, itching and burning sensations over the whole body became severe and the patient was miserable The temperature rose to 100 F and the generalized diffuse reddening of the skin with innumerable tiny papules and vesicles made a striking picture. These vesicles were especially evident over the palms and soles, and the tongue was reddened and coated *and had begun to scale Photographs were taken at this time* (figs 4, 5 and 6) and the following laboratory studies were carried out

Blood atabrine levels April 9 12 micrograms per liter, April 12, 12 April 15, 8, April 18, 2 April 21, 10 (probable error), April 23, 4

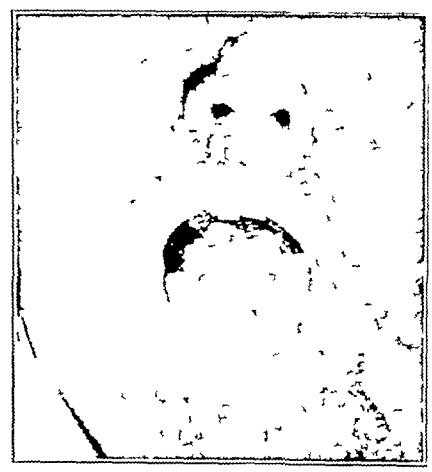

Fig 6 (case 5) —Face and tongue seventy two hours after original test dose.

The urine contained many red blood cells

| April 18—WBC 7 950 | P 72 | L-25 | E 3 | M-0 |
| April 21—WBC 9 900 | P-62 | L-30 | E 2 | M-6 |
| April 23—WBC 8 100 | P 70 | L-26 | E-0 | M-4 |

Serum protein Total, 6 32 Gm. per hundred cubic centimeters, albumin globulin ratio, 3 85/2 47, or 1.52.

Van den Bergh Delayed, 0 5 mg (normal 0 1 to 0 25 mg)
Cholesterol, 160 Cholesterol esters 117, or 73 per cent
Blood fibrinogen 0 61 per cent
Sulfobromophthalein retention 3 per cent.
Glucose tolerance test (oral) Fasting, 96, fifteen minutes, 143, thirty minutes, 178, sixty minutes, 200, one hundred and twenty minutes, 170 Gm per hundred cubic centimeters

The patient remained febrile, having a low grade temperature up to 100 F until April 28 By April 10 he had developed huge bullae over the palms and soles which had to be aspirated and which unfortunately were not photographed On April 12 the dermatitis began to subside and a fine branny desquamation began to appear over the face and trunk, the eczematoid changes being confined to the sites of the patch tests From that time he improved steadily and was fairly comfortable by the time his fever declined but by April 29 was still scaling and had scattered violaceous papules over the upper trunk and some slight persistent eczematoid changes at the patch test sites and the paranasal and circumoral regions A sulfobromophthalein test done on April 27 showed a return to normal, there being no retention of the dye.

COMMENT

It is seen that these cases are remarkably similar in clinical appearance and autopsy findings In all there was a rash followed by desquamation, the rash being scarlatiniform, maculopapular or a dry scaling involving the entire body, beginning on the face and including the palms and soles The onset of the rash may occur as early as the second or as late as the tenth day on as little as 0 1 Gm in a sensitized patient, although larger doses are usually necessary It may be that sensitization is acquired from previous ingestion of the drug, because all these patieants as well as the one who was the subject of the report had had atabrine one or more times before reaction occurred Also it seems that smaller and smaller amounts are required to produce severe reactions In addition to the rash, conjunctivitis and exfoliation of the tongue occur Jaundice resulting from hepatitis may appear, usually several days after the skin eruption, accompanied by high septic fever, leukocytosis as high as 40,000 per cubic millimeter and with a rising eosinophil count up to 45 per cent The urine contains bile and albumin but is usually negative for urobilinogen The liver is first enlarged and tender but rapidly shrinks in size and in 2 cases was strikingly small at autopsy Mental clouding is a constant feature and as the desquamation progresses to a thick leathery skin, generalized discrete adenopathy becomes palpable The downhill course is gradual with wasting, often eczematoid skin changes, progressive liver failure and death in coma in the third to the fifth week At autopsy there is characteristically the exfoliative dermatitis, gross and microscopic evidence of severe hepatitis or necrosis producing a small wrinkled liver with mottled red and yellow degenerated areas, acute cloudy swelling of the kidneys with bile staining, generalized moderate lymphadenopathy and splenomegaly typical of malarial infection

The evidence for atabrine as the etiologic agent may be summarized as follows 1 Atabrine was the only drug common to all cases 2 Positive patch tests to atabrine with negative controls were obtained in the 4 cases tested (80 per cent), whereas in a control group of patients with severe dermatitis only 8 3 per cent positive reactions were obtained 3 Autopsy and laboratory studies revealed no other etiologic agent 4 The cases were admitted for totally unrelated diseases, but their terminal clinical and pathologic findings were strikingly similar 5 Exfoliation was accidentally produced in the first case with only 0 1 Gm of the drug 6 The fifth case was well controlled and would seem to leave no doubt that atabrine was the etiologic agent

ATABRINE SENSITIVITY TESTS

It was thought desirable to devise some sensitivity test to determine atabrine sensitivity Such a test would be useful both in predicting and in preventing reactions in selected cases and as a diagnostic procedure when clinical evidence of reaction already existed Routine Chinese admissions to a medical service were used All of these were proved malarial and were getting or had just received atabrine in therapeutic doses Ordinary atabrine dihydrochloride tablets dissolved in tap water in approximate dilutions of 0 1 Gm to 10 cc, giving in effect a dilute paste, were found most suitable for patch tests, a small square of gauze being saturated with this solution and taped on the forearm for the period of the test A control test using one of the sulfonamides, acetylsalicylic acid or phenobarbital was always used on the opposite arm In a number of cases the skin was also superficially scratched before the patch was applied These tests were read at twenty-four or forty-eight hour intervals In addition, a 1 200 dilution of atabrine dihydrochloride was used for conjunctival tests

In 45 patients tested no conjunctival reactions were seen, and since 3 of these patients had positive skin tests this procedure was discarded In an attempt to learn the incidence of false positive reactors, 100 selected patients were tested with the twenty-four hour patch, the forty-eight hour patch and the twenty-four hour scratch-patch tests Three of these patients were thought to have atabrine psychoses and were the only ones in the group having any evidence of atabrine sensitivity Only those patients were included whose control tests were negative There were 5 positive reactors when the twenty-four hour patch test was used and an additional 5 positives when the patch was left on for forty-eight hours When the twenty-four hour scratch-patch test was used there were 11 positive reactors Of the psychosis patients 1 was negative by all tests, the other 2 positive by all tests (Subsequent testing on patients with atabrine psychosis has shown only infrequent positive skin tests) Positive reactions varied from itching and reddening to ulceration In some cases a large yellow bulla formed at the site of the patch The most typical reaction was a pruritic reddened slightly edematous area with several small discrete papules Discounting the 2 positively reacting psychosis patients, it is seen that the percentage of false positive reactors is 3 with the twenty-four hour patch test, 8 with the forty-eight hour patch test and 9 with the scratch-patch test It is believed that this increase in the incidence of false positive reactors is due to the nonspecific irritating effect of atabrine on the skin This conclusion is further borne out by the type of reaction seen Itching, reddening and formation of papules was the extent of the reaction seen in the twenty-four hour patch test, while ulceration and formation of bullae occurred only with the more prolonged or more severe tests For this reason ulceration and bullous formation should be regarded with the suspicion that a nonspecific irritation rather than a positive test for sensitivity has been obtained, although it is possible for true reactors to produce this severe type of reaction Because of the lessened incidence of false positive reactors and because of the more characteristic skin response, the twenty-four hour patch test is recommended as the one of choice In cases with an existent dermatitis, this nonspecific irritant effect casts some doubt on the validity of the reaction, but a positive atabrine test with a negative control lends considerable weight to the argument that atabrine is

the offending agent Twelve severe dermatitis cases of known cause (scabies, with pyoderma, infectious eczematoid dermatitis and dermatitis venenata) were tested with the twenty-four hour patch test while the skin was in an irritated state, and only 1 venenata case gave a false positive reaction, manifested by vesiculation at the site of the patch Only 3 cases of proved atabrine dermatitis other than exfoliative dermatitis have been found One was a maculopapular eruption resembling measles The other 2 were discrete papular rashes on the trunk and the extremities Atabrine patch tests were positive in all these cases, and the rashes were reproduced by readministration of atabrine but only after a minimum of 0 6 Gm was given One case is cited

A young Chinese man was admitted for simple P vivax malaria and was given atabrine On the third day he became excited and confused and developed a discrete papular rash over the face, trunk and extremities, especially on the distal extensor surfaces. Conjunctival and intradermal tests were negative, but the twenty-four patch test produced an itchy, papular reaction The malaria was controlled with quinine, and two weeks later, when the patient had recovered, atabrine was again administered and the patch test repeated The latter was again positive, but no symptoms appeared until 0 7 Gm was given, 0 1 Gm. the first day, 0.2 Gm the second and 0 4 Gm the third day At this time the psychosis and dermatitis were reproduced, being more severe and more persistent than on the first occasion.

It is felt that patch testing may be useful in patients giving any history of previous dermatologic sensitivity and is definitely of value in determining the etiologic agent in patients suspected of showing skin reactions to atabrine

SUMMARY

1 In a large series of Chinese patients receiving atabrine for prophylaxis or treatment for malaria, 5 with severe hepatitis and exfoliative dermatitis were encountered, 3 of whom died of this complication This represented a very small incidence, about 1 in 2,000 to 3,000 cases

2 From clinical and pathologic studies it is concluded that atabrine was the causative agent of the hepatitis and the exfoliative dermatitis

3 The reaction may occur from extreme sensitivity on as little as 0 1 Gm of the drug or may be a toxic reaction from prolonged and repeated administration

4 Prompt recognition and treatment of these complications with recognized detoxifying agents like vitamin C and liver extract, intravenous glucose and plasma, combined with withdrawal of the drug, may prove to be life saving procedures, although the mortality in 5 cases was 60 per cent

5 The twenty-four hour patch atabrine test giving only 3 per cent false positive reactions with normal skins and 8 3 per cent false positive reactions in patients with existent dermatitis is a useful test for investigation of atabrine sensitivity

**Men in Natural Sciences**—In the last fifty years men in the natural sciences have had no difficulty in understanding in fully appreciating the efforts of, and meeting on common grounds with, fellow scientists from every nation of the earth In the natural sciences, at least, we do not need so much additional practice in fair and humane international relations with our fellow scientists—Carlson A J Is There "A Standard to Which the Wise and the Honest Can Repair?" *Science* **103** 377 (March 29) 1946

## TREATMENT OF A SERIOUSLY ILL ASTHMATIC PATIENT

HADDON M CARRYER, M D
LOUIS E PRICKMAN, M D
C K MAYTUM, M D
and
GILES A KOELSCHE, M D
Rochester, Minn

During the recent emergency the care of patients seriously ill from asthma was thrust on many physicians who were not especially interested or trained for this responsibility Contrary to the pessimistic view frequently expressed by the public, considerable benefit can be given most patients with asthma by the application of measures now at the command of most physicians These two considerations have prompted us to reexamine the procedure and remedies which have been found most helpful at the Mayo Clinic in the symptomatic treatment of the patient severely ill with asthma

HOSPITALIZATION

Severe asthma can be treated best in a hospital, and preferably the patient should have a private room There are a number of reasons for hospitalization In the first place, nervous factors are often important in aggravating asthma Patients who are apprehensive or panic stricken by their dyspnea in an atmosphere of anxiety caused by an oversolicitous family or friends, respond favorably to the new surroundings Confidence and hope replace in some a fear of impending death The quiet hospital atmosphere and prompt administration of appropriate remedies as soon as needed help the nervous sufferer from asthma to react favorably

In the hospital room devoid of rugs, drapes and overstuffed furniture, and where no animals with offending danders have been, the patient is removed from many of the important inhalent allergens found in his home environment Before the asthmatic patient arrives in the hospital room all feather pillows and the mattress should be made dustproof with special impervious covers Every hospital should have a supply of such covers immediately available for the asthmatic patient. Kapok pillows are not satisfactory, but rubber foam or air pillows may be used occasionally The daily cleansing of the room throughout the patient's stay in the hospital is best done with a damp cloth All types of sweeping should be avoided The physician should see that orders of this type are transmitted to the proper persons

If the patient's asthma is associated with hay fever, a pollen filter in the window is most important Transoms, doors and other windows in the room should be kept closed when a pollen filter is being used

When bronchitis or other respiratory infections are the chief cause of the patient's asthma, as so often occurs in the group of older patients, there are distinct advantages to hospital care Asthmatic bronchitis subsides more quickly in a room which is free from drafts, smoke and furnace or other fumes and is kept at an even temperature Also control of medication with sulfonamides and penicillin when indicated is attained more readily in the hospital than at home, together with oxygen and helium therapy, intravenous medication and treatment of certain complications such as bronchostenosis

From the Division of Medicine, Mayo Clinic

Van den Bergh Delayed, 0.5 mg. (normal 0.1 to 0.25 mg.)
Cholesterol, 160. Cholesterol esters 117, or 73 per cent.
Blood fibrinogen 0.61 per cent.
Sulfobromophthalein retention 3 per cent.
Glucose tolerance test (oral). Fasting, 96, fifteen minutes, 143, thirty minutes, 178, sixty minutes, 200, one hundred and twenty minutes, 170 Gm. per hundred cubic centimeters.

The patient remained febrile, having a low grade temperature up to 100 F. until April 28. By April 10 he had developed huge bullae over the palms and soles which had to be aspirated and which unfortunately were not photographed. On April 12 the dermatitis began to subside and a fine branny desquamation began to appear over the face and trunk, the eczematoid changes being confined to the sites of the patch tests. From that time he improved steadily and was fairly comfortable by the time his fever declined but by April 29 was still scaling and had scattered violaceous papules over the upper trunk and some slight persistent eczematoid changes at the patch test sites and the paranasal and circumoral regions. A sulfobromophthalein test done on April 27 showed a return to normal, there being no retention of the dye.

*COMMENT*

It is seen that these cases are remarkably similar in clinical appearance and autopsy findings. In all there was a rash followed by desquamation, the rash being scarlatiniform, maculopapular or a dry scaling involving the entire body, beginning on the face and including the palms and soles. The onset of the rash may occur as early as the second or as late as the tenth day on as little as 0.1 Gm. in a sensitized patient, although larger doses are usually necessary. It may be that sensitization is acquired from previous ingestion of the drug, because all these patients as well as the one who was the subject of the report had had atabrine one or more times before reaction occurred. Also it seems that smaller and smaller amounts are required to produce severe reactions. In addition to the rash, conjunctivitis and exfoliation of the tongue occur. Jaundice resulting from hepatitis may appear, usually several days after the skin eruption, accompanied by high septic fever, leukocytosis as high as 40,000 per cubic millimeter and with a rising eosinophil count up to 45 per cent. The urine contains bile and albumin but is usually negative for urobilinogen. The liver is first enlarged and tender but rapidly shrinks in size and in 2 cases was strikingly small at autopsy. Mental clouding is a constant feature and as the desquamation progresses to a thick leathery skin, generalized discrete adenopathy becomes palpable. The downhill course is gradual with wasting, often eczematoid skin changes, progressive liver failure and death in coma in the third to the fifth week. At autopsy there is characteristically the exfoliative dermatitis, gross and microscopic evidence of severe hepatitis or necrosis producing a small wrinkled liver with mottled red and yellow degenerated areas, acute cloudy swelling of the kidneys with bile staining, generalized moderate lymphadenopathy and splenomegaly typical of malarial infection.

The evidence for atabrine as the etiologic agent may be summarized as follows: 1. Atabrine was the only drug common to all cases. 2. Positive patch tests to atabrine with negative controls were obtained in the 4 cases tested (80 per cent), whereas in a control group of patients with severe dermatitis only 8.3 per cent positive reactions were obtained. 3. Autopsy and laboratory studies revealed no other etiologic agent. 4. The cases were admitted for totally unrelated diseases, but their terminal clinical and pathologic findings were strikingly similar. 5. Exfoliation was accidentally produced in the first case with only 0.1 Gm. of the drug. 6. The fifth case was well controlled and would seem to leave no doubt that atabrine was the etiologic agent.

ATABRINE SENSITIVITY TESTS

It was thought desirable to devise some sensitivity test to determine atabrine sensitivity. Such a test would be useful both in predicting and in preventing reactions in selected cases and as a diagnostic procedure when clinical evidence of reaction already existed. Routine Chinese admissions to a medical service were used. All of these were proved malarial and were getting or had just received atabrine in therapeutic doses. Ordinary atabrine dihydrochloride tablets dissolved in tap water in approximate dilutions of 0.1 Gm. to 10 cc., giving in effect a dilute paste, were found most suitable for patch tests, a small square of gauze being saturated with this solution and taped on the forearm for the period of the test. A control test using one of the sulfonamides, acetylsalicylic acid or phenobarbital was always used on the opposite arm. In a number of cases the skin was also superficially scratched before the patch was applied. These tests were read at twenty-four or forty-eight hour intervals. In addition, a *1:200* dilution of atabrine dihydrochloride was used for conjunctival tests.

In 45 patients tested no conjunctival reactions were seen, and since 3 of these patients had positive skin tests this procedure was discarded. In an attempt to learn the incidence of false positive reactors, 100 selected patients were tested with the twenty-four hour patch, the forty-eight hour patch and the twenty-four hour scratch-patch tests. Three of these patients were thought to have atabrine psychoses and were the only ones in the group having any evidence of atabrine sensitivity. Only those patients were included whose control tests were negative. There were 5 positive reactors when the twenty-four hour patch test was used and an additional 5 positives when the patch was left on for forty-eight hours. When the twenty-four hour scratch-patch test was used there were 11 positive reactors. Of the psychosis patients 1 was negative by all tests, the other 2 positive by all tests. (Subsequent testing on patients with atabrine psychosis has shown only infrequent positive skin tests.) Positive reactions varied from itching and reddening to ulceration. In some cases a large yellow bulla formed at the site of the patch. The most typical reaction was a pruritic, reddened slightly edematous area with several small discrete papules. Discounting the 2 positively reacting psychosis patients, it is seen that the percentage of false positive reactors is 3 with the twenty-four hour patch test, 8 with the forty-eight hour patch test and 9 with the scratch-patch test. It is believed that this increase in the incidence of false positive reactors is due to the nonspecific irritating effect of atabrine on the skin. This conclusion is further borne out by the type of reaction seen. Itching, reddening and formation of papules was the extent of the reaction seen in the twenty-four hour patch test, while ulceration and formation of bullae occurred only with the more prolonged or more severe tests. For this reason ulceration and bullous formation should be regarded with the suspicion that a nonspecific irritation rather than a positive test for sensitivity has been obtained, although it is possible for true reactors to produce this severe type of reaction. Because of the lessened incidence of false positive reactors and because of the more characteristic skin response, the twenty-four hour patch test is recommended as the one of choice. In cases with an existent dermatitis, this nonspecific irritant effect casts some doubt on the validity of the reaction, but a positive atabrine test with a negative control lends considerable weight to the argument that atabrine is

the offending agent Twelve severe dermatitis cases of known cause (scabies, with pyoderma, infectious eczematoid dermatitis and dermatitis venenata) were tested with the twenty-four hour patch test while the skin was in an irritated state, and only 1 venenata case gave a false positive reaction, manifested by vesiculation at the site of the patch Only 3 cases of proved atabrine dermatitis other than exfoliative dermatitis have been found One was a maculopapular eruption resembling measles The other 2 were discrete papular rashes on the trunk and the extremities Atabrine patch tests were positive in all these cases, and the rashes were reproduced by readministration of atabrine but only after a minimum of 0 6 Gm was given One case is cited

A young Chinese man was admitted for simple P vivax malaria and was given atabrine On the third day he became excited and confused and developed a discrete papular rash over the face, trunk and extremities, especially on the distal extensor surfaces Conjunctival and intradermal tests were negative, but the twenty-four patch test produced an itchy, papular reaction The malaria was controlled with quinine, and two weeks later, when the patient had recovered, atabrine was again administered and the patch test repeated The latter was again positive, but no symptoms appeared until 0 7 Gm was given, 0 1 Gm. the first day, 0.2 Gm the second and 0 4 Gm the third day At this time the psychosis and dermatitis were reproduced being more severe and more persistent than on the first occasion

It is felt that patch testing may be useful in patients giving any history of previous dermatologic sensitivity and is definitely of value in determining the etiologic agent in patients suspected of showing skin reactions to atabrine

SUMMARY

1 In a large series of Chinese patients receiving atabrine for prophylaxis or treatment for malaria, 5 with severe hepatitis and exfoliative dermatitis were encountered, 3 of whom died of this complication This represented a very small incidence, about 1 in 2,000 to 3,000 cases

2 From clinical and pathologic studies it is concluded that atabrine was the causative agent of the hepatitis and the exfoliative dermatitis

3 The reaction may occur from extreme sensitivity on as little as 0 1 Gm of the drug or may be a toxic reaction from prolonged and repeated administration

4 Prompt recognition and treatment of these complications with recognized detoxifying agents like vitamin C and liver extract, intravenous glucose and plasma, combined with withdrawal of the drug, may prove to be life saving procedures, although the mortality in 5 cases was 60 per cent

5 The twenty-four hour patch atabrine test giving only 3 per cent false positive reactions with normal skins and 8 3 per cent false positive reactions in patients with existent dermatitis is a useful test for investigation of atabrine sensitivity

GILES A KOELSCHE M D
Rochester, Minn

During the recent emergency the care of patients seriously ill from asthma was thrust on many physicians who were not especially interested or trained for this responsibility Contrary to the pessimistic view frequently expressed by the public, considerable benefit can be given most patients with asthma by the application of measures now at the command of most physicians These two considerations have prompted us to reexamine the procedure and remedies which have been found most helpful at the Mayo Clinic in the symptomatic treatment of the patient severely ill with asthma

## HOSPITALIZATION

Severe asthma can be treated best in a hospital, and preferably the patient should have a private room There are a number of reasons for hospitalization In the first place, nervous factors are often important in aggravating asthma Patients who are apprehensive or panic stricken by their dyspnea in an atmosphere of anxiety caused by an oversolicitous family or friends, respond favorably to the new surroundings Confidence and hope replace in some a fear of impending death The quiet hospital atmosphere and prompt administration of appropriate remedies as soon as needed help the nervous sufferer from asthma to react favorably

In the hospital room devoid of rugs, drapes and overstuffed furniture, and where no animals with offending danders have been, the patient is removed from many of the important inhalent allergens found in his home environment Before the asthmatic patient arrives in the hospital room all feather pillows and the mattress should be made dustproof with special impervious covers Every hospital should have a supply of such covers immediately available for the asthmatic patient Kapok pillows are not satisfactory, but rubber foam or air pillows may be used occasionally The daily cleansing of the room throughout the patient's stay in the hospital is best done with a damp cloth All types of sweeping should be avoided The physician should see that orders of this type are transmitted to the proper persons

If the patient's asthma is associated with hay fever, a pollen filter in the window is most important Transoms, doors and other windows in the room should be kept closed when a pollen filter is being used

When bronchitis or other respiratory infections are the chief cause of the patient's asthma, as so often occurs in the group of older patients, there are distinct advantages to hospital care Asthmatic bronchitis subsides more quickly in a room which is free from drafts, smoke and furnace or other fumes and is kept at an even temperature Also control of medication with sulfonamides and penicillin when indicated is attained more readily in the hospital than at home, together with oxygen and helium therapy, intravenous medication and treatment of certain complications such as bronchostenosis

From the Division of Medicine Mayo Clinic

The ward, which is less costly than a private room, has a number of serious disadvantages Much more dust is encountered than in the private room because it is impossible to cover all pillows and mattresses in the ward with dustproof covers and to control other patients' use of cosmetics their clothing or accessories, any of which may be irritating to the patient who has asthma. An acute attack of asthma alarms all the patients in the ward and interferes with their rest, especially at night

When hospitalization of the severely ill asthmatic patient is not possible, every effort to make the environment at home as nearly like that of a hospital room is well worth while It also goes without saying that intelligent, calm professional or home nursing care is essential to the patient seriously ill from asthma He cannot help himself and he rapidly becomes worse when prompt symptomatic relief is not at hand when he needs it.

### USEFUL DRUGS AND PROCEDURES

There are scores of preparations for the symptomatic relief of asthma, many of proved value, others not so effective or with properties which should prohibit their general use Some of the drugs or procedures most useful in the treatment of asthma will be considered.

*Inhalation Therapy*— Inhalation therapy is a valuable part in the treatment of seriously ill asthmatic patients The use of a mask of the BLB type is most satisfactory Patients frequently object to being confined in an oxygen tent Also the continued use of a nasal catheter proves objectionable The prompt administration of gases is not as readily achieved with the last two methods

Oxygen or preferably oxygen diluted with helium may be used For the most seriously ill patient 20 per cent oxygen with 80 per cent helium is preferable More often greater concentrations of oxygen may be used The rate of flow of these gases should be from 6 to 9 liters per minute, provided this rate of flow keeps the rebreathing bag filled

Treatment with oxygen and helium should be used during acute attacks The patient should understand that the gases are not provided to stop an acute paroxysm but to serve to make him more comfortable during such an episode Often patients unaccustomed to such treatment will discard the mask at first and call for remedies with which they are acquainted

Barach[1] studied the deranged physiology of breathing in cases of asthma and advocated administration of therapeutic gases under positive pressure This tends to relieve the increased negative intrapulmonary pressure of obstructive dyspnea and facilitates the entrance of therapeutic gases during inspiration During expiration the bronchioles are less constricted These benefits in turn lessen edema in the pulmonary tissues and vascular congestion

With these findings in mind, Barach suggested oxygen and helium therapy for two hours daily even in the absence of acute respiratory distress Such gases may be administered with a positive pressure hood or mask Positive pressure of from 10 to 13 cm of water is used in such cases, with a flow of from 6 to 9 liters of gas per minute

Mixtures rich in helium cause the patient's voice to be higher pitched A word of explanation will prevent alarm over the pitch of the voice Oxygen containers should be removed from the room, as a precautionary measure, if burning stramonium powders are employed in treatment of asthma

Periodic inhalation of carbon dioxide causes hyperventilation, which tends to prevent the retention of secretions and the development of atelectasis This form of therapy is most helpful for asthmatic patients after undergoing surgical procedures, especially in the upper part of the abdomen The tendency of such patients to atelectasis is lessened

*Epinephrine*—Many medicines are of proved value in the relief of an acute asthma attack The use of these may begin before the hospital care is made available and must be continued throughout the stormy phase of the patient's illness

Epinephrine remains the most useful drug An aqueous solution administered hypodermically is best At times it may be necessary to give it at intervals of twenty minutes The usual dose employed at the Mayo Clinic is 0 5 cc of a 1 1,000 solution. When a patient presents a history of a satisfactory therapeutic response to less epinephrine, less should be used The accidental use of inadequate dosage by employing solutions of epinephrine in dilutions weaker than 1 1,000 should be avoided Such dilutions are frequently used in obstetric practice

The general limits of blood pressure should be known before the administration of epinephrine Moderate elevation of the blood pressure is not, however, a contraindication to the use of this drug An acutely ill asthmatic patient may receive greater trauma to his cardiovascular system from struggling in a severe attack of asthma than he will from the cautious use of epinephrine to halt the attack The use of this drug for elderly patients who have arteriosclerotic changes must be undertaken with caution, although here too age alone is not an absolute contraindication

The slow absorption of epinephrine dissolved in oil or in solutions containing gelatin does not make for accurate control of medication Relief is not as promptly attained when epinephrine is given in oil or gelatin, and epinephrine is absorbed at times when perhaps it is less urgently needed than it was earlier For this reason use of aqueous solutions are preferred for patients in the hospital where nursing service is available

As improvement takes place we prefer giving instruction in the use of a spray for the oral administration of this drug to the patient for whom continued use of epinephrine appears indicated In such a spray a 1 per cent aqueous solution of epinephrine usually is employed, although at times a 3 per cent solution may be required A number of effective nebulizers are available for the administration of epinephrine Careful instructions in the use of the spray should be given the patient The spout of the nebulizer should be placed in the mouth and directed toward the pharynx As the rubber bulb is squeezed, the patient should inhale deeply the fine spray through the mouth Merely spraying the throat is frequently the cause for the poor results from this procedure At the onset not more than two inhalations of nebulized epinephrine at a time should be taken because of the potential danger of overmedication, since a latent period of five minutes or longer occurs before the full therapeutic effect is

1 Barach A. L. Physiologically Directed Therapy in the Treatment of Intractable Bronchial Asthma, Bull. New York Acad Med. 20: 538-549 (Oct.) 1944

realized After some experience the patient can judge his own dosage needs Because of the greater strength of solutions of epinephrine designed for oral use, the patient should be warned not to use this solution hypodermically Profuse bronchial secretions dilute the epinephrine in the spray and may render it ineffective

Patients to whom large and frequent doses of epinephrine have been administered in the preceding few hours may become "epinephrine fast" on occasions At this time they will respond little or not at all to the continued administration of the drug Reversal of this state usually will occur within twelve to twenty-four hours, provided epinephrine is not used and reliance is temporarily placed on measures to be described

*Substitutes for Epinephrine*—For the acutely ill asthmatic patient the intravenous administration of hypertonic solutions of dextrose containing aminophylline is of great value It has been our custom to administer twice daily 250 cc of 20 per cent solution of dextrose to which 3¾ grains (0 25 Gm ) of aminophylline has been added When this concentration of dextrose is not immediately available, a 10 per cent solution may be used It is probable that the use of such hypertonic solutions reduces pulmonary edema Likewise this dextrose furnishes nutriment to an exhausted patient Repeated use of epinephrine tends to exhaust the glycogen content of the liver Replacing this is accomplished by the administration of dextrose

Aminophylline[2] is of proved value in relaxing bronchial spasm in the asthmatic patient Its intravenous administration should be slow and in diluents as described, concentrated solutions should rarely be given by vein Oral administration of aminophylline can be used to augment the dose given intravenously From 1½ to 3 grains (0 1 to 0 2 Gm ) administered by mouth three times daily seems to be the optimal dose This drug may be given by rectal administration in a dose of 7½ grains (0 5 Gm ) For such use the powder may be dissolved in 20 cc of tap water and inserted by means of a syringe and catheter or the drug may be provided in the form of a suppository to which a sedative has been added[1]

*Ephedrine and Ephedrine-like Drugs*—Use of ephedrine-like drugs stimulates the sympathetic nervous system and thus causes relaxation of the bronchial constriction in bronchial asthma It also may exert a direct effect on the bronchial musculature Proprietary preparations commonly employ a barbiturate, such as phenobarbital or pentobarbital, in combination with ephedrine to offset side actions, such as psychic excitation and palpitation Xanthine derivatives, such as theophylline or aminophylline, likewise are often included in such preparations Certain newer ephedrine-like synthetic drugs have less severe side effects than the older preparations For the acutely ill patient these drugs may be used about four times daily As soon as convalescence becomes established, these may be used every four hours if needed for the control of asthma When nocturnal attacks of asthma prove troublesome an enteric coated preparation containing ephedrine may be given at bedtime Since absorption is delayed, this preparation frequently will control such attacks

*Expectorants*—The mucus in the bronchioles of an asthmatic patient is usually viscous and tenacious Much exhausting coughing on the part of the patient is necessary to dislodge and raise this mucus Therefore an expectorant is of utmost value to the patient, particularly when bronchitis is a prominent etiologic factor Iodides in liberal quantities are the most useful of the expectorants, ammonium chloride is less effective and is reserved for the occasional patient who does not tolerate iodides well The expectorant is a frequently omitted adjuvant in the treatment of asthmatic patients The air of the patient's room should be adequately humidified Inhalation of steam will help in most cases of acute bronchitis

Two prescriptions containing iodides which are of value are given in table 1 The first mentioned prescription is more palatable and hence is preferred by most patients When bronchitis is the primary problem,

TABLE 1—*Two Prescriptions Containing Iodides*

| | Gm or Cc |
|---|---|
| Potassium iodide | 17 50 |
| Fluidextract of lobelia | 1 50 |
| Fluidextract of hyoscyamus | 1.50 |
| Glycerin | 20 00 |
| Simple elixir in sufficient quantity to make | 250 00 |

Directions One teaspoon in water three times daily after meals

| | Gm or Cc |
|---|---|
| Potassium iodide | 10 00 |
| Sodium iodide | 10 00 |
| Tincture of belladonna | 20 00 |
| Tincture of hyoscyamus | 20 00 |
| Tincture of lobelia | 20 00 |
| Fluidextract of grindelia fluidextract of glycyrrhiza syrup of tolu balsam each in sufficient quantity to make | 200 00 |

Directions One teaspoon in water three times daily after meals

TABLE 2—*Ammonium Chloride in Sour Mixture*

| | | Gm or Cc |
|---|---|---|
| Ammonium chloride | | 10 00 |
| Syrup of citric acid | | 50 00 |
| Water | to make | 100 00 |

Directions One teaspoon freely diluted with water every two hours

it is preferable In the second prescription there are apparent pharmacologic antagonists present with the tinctures offsetting the effect of the iodides However, actually the effects are not diametrically opposed and the prescription is of definite value Its value is particularly great when bronchorrhea produced by the first prescription is excessive, when associated vasomotor rhinitis is aggravated and when allergic factors are of greatest importance It should be pointed out to the patient that the expectorant containing iodide is given for the bronchitis and should be used continuously when asthma is troublesome or when asthma is threatened, as in convalescing from acute bronchitis Should evidence of active tuberculosis be present, iodides are contraindicated For children a saturated solution of potassium iodide is more easily administered than either of the prescriptions given

A small percentage of patients are unable to tolerate iodides An acne-like eruption or swelling and pain in the salivary glands develop When a skin eruption appears only after iodides have been given for several days, iodides may be used in short courses and treatment can be stopped before the day of the anticipated

eruption In many cases ammonium chloride must be used then Ammonium chloride is best prescribed in sour mixtures [3] in the manner presented in table 2

*Sedatives, Estrogens and Stramonium*—Fear is an important factor in the production of asthma Severe exhaustion and apprehension coupled with poor nervous stamina will increase the severity of an attack of asthma and will cause an attack to develop on slight provocation Likewise the loss of sleep brought about by repeated nocturnal attacks of asthma causes profound exhaustion For such patients small doses of phenobarbital are helpful Excessive sedation should be avoided, as it is important not to suppress the belabored respiratory center

For women who have premenstrual tension associated with exacerbation of their asthma, oral use of estrogens during the two weeks before menstruation may be necessary in addition to sedatives The continuous use of estrogens should be considered particularly for menopausal patients who have ceased menstruating and who have appreciable vasomotor instability

Use of opiates is mentioned to be condemned Although they ease the apprehension of the patient, they depress the respiratory center and in doing so place the patient in serious jeopardy of immediate death from respiratory failure Secondarily the closely associated cough center is suppressed at a time when raising secretions is of utmost importance

Another commonly used treatment which is mentioned because of its deleterious effect from a long-range point of view is the fumes from burning stramonium powder Temporary relief is obtained from this treatment, but bronchial irritation produced may cause further asthma at a later date If the patient has confidence in such treatments, it is a good practice not to deprive one who is seriously ill of this during the first day or so of hospital care The reason for this is to prevent the fear that withdrawal of such medication would induce

*Special Measures for Patients Who Are Critically Ill*—For critically ill patients such measures as intravenous administration of 1 cc of 1 1,000 solution of epinephrine in 1 liter of isotonic solution of sodium chloride given very slowly and the use of nikethamide or pentamethylene tetrazol (metrazol) may be necessary Such measures are employed only when respiratory failure is imminent They are particularly useful when morphine has been given before the patient has come under observation With respiratory failure the use of an inhalator will increase the respiratory excursion, and helium and oxygen mixtures should be used for inhalation therapy

*Diet*—In considering a diet for the seriously ill asthmatic patient, foods known to be poorly tolerated by that patient should be omitted A positive skin test alone is insufficient evidence to warrant the omission of nutritious foods from the diet of a patient In most cases a general tray may be served Subsequent modifications of this regimen may be introduced as their necessity becomes apparent Often a patient with an eye too closely fixed on reactions to skin tests will cause his health to suffer more through bizarre and inadequate diet than it might from the atopic disorders prompting such diets A light evening meal is preferred to a large meal Supplements of vitamins which appear indicated in an individual case should be given

3 Hatcher R A and Wilbert M I The Pharmacology of Useful Drugs Chicago American Medical Association 1915 p 327

### COMPLICATIONS

Complications of asthma frequently include bronchostenosis, bronchitis with fever and pneumonia The role of coexisting bronchostenosis should be suspected if the patient presents a history of recurrent febrile episodes associated with chills, if there is a history of unexplained hemoptysis or if examination of the chest reveals persistent suppression of breath sounds, especially in the bases of the lungs When any of these characteristic features is present, bronchoscopy is indicated after the acute phase of the asthma has subsided For bronchitis associated with fever and for pneumonia, sulfonamides or penicillin should be employed early Because many of these patients have associated emphysema, acute infectious processes represent a considerably greater hazard to the patient

A useful adjunct in the treatment of asthma in which bronchitis is an important etiologic factor may be had in a roentgen treatment to the bronchi Opinions that roentgen irradiation may exercise a beneficial effect on the chronically inflamed bronchial mucous membrane are accumulating [4]

As the patient improves, greater latitude in an evaluation of long-range factors affecting the asthma is possible An investigation of the allergies involved may be undertaken The presence of coexisting sinus disease may be determined If purulent discharge is seen in the nose, if a history of frequent head colds is obtained or if a yellow postnasal drip is noted, sinusitis should be suspected Roentgenographic examination of the sinuses should be made in all cases of asthma Active sinusitis should be eradicated by such measures as may prove to be indicated

### TREATMENT AFTER DISMISSAL FROM HOSPITAL

When finally the patient is dismissed from the hospital, *it is well to outline a regimen which will include* several items Methods for preparing a dustfree bedroom must be suggested Dustproof covers should be applied to the mattress and pillows in the patient's home This is done partly because of allergic factors and partly because dust serves as a respiratory irritant Caution concerning the irritation from a habit of coughing is at times warranted, although patients who raise quantities of sputum should be spared such admonitions The use of tobacco is contraindicated in most cases of asthma The addition of any irritation from tobacco to the bronchitis under treatment had best be avoided The medication employed to the time of the patient's dismissal from the hospital should be continued without interruption during the transition to home care This should include expectorant (if tolerated), ephedrine or ephedrine-like drugs and, if epinephrine has been required in quantity, use of nebulized epinephrine Certain patients should be instructed in the method of administering epinephrine hypodermically The availability of this form of treatment eases the patient's apprehension

### SUMMARY

We now have at our disposal many tried adjuncts in treatment of the patient who is seriously ill with asthma While not one of these is of recent introduction, the diligent application of these several measures will materially aid in the care of such a patient

Many house mice trapped in the homes of choriomeningitis patients are virus carriers [1] and infection in experimental mouse colonies may persist indefinitely, being transmitted from one generation to the next [2] These observations suggest that a building harboring infected mice could be a persistent source of human disease, and the present report appears to be an instance in which this occurred

Three cases of choriomeningitis developed among the residents of a multiple family dwelling in Raleigh, N C, and a fourth case in a near neighbor All 4 were quite characteristic clinically The first patient, a woman aged 32, was identified by the development of neutralizing antibodies in her blood serum The cerebrospinal fluid was avirulent for mice The following month two house mice were trapped in the building Their brains were suspended in saline solution and injected intracerebrally into albino mice Typical convulsions occurred seven days later The virus was later shown to be serologically indistinguishable from the W E strain of choriomeningitis [3]

Two years later a man aged 31 who also lived in the building developed similar symptoms In this case virus was demonstrated in the cerebrospinal fluid drawn on the third day of the disease Antibodies were likewise demonstrated in this case Twelve months later a woman aged 40 residing in the building had aseptic meningitis Virus was not found in her cerebrospinal fluid, drawn on the sixth day, but neutralizing antibodies appeared in her blood one month later

The fourth patient was a boy aged 14 years whose home was in an adjoining building but who frequented the apartment house Cerebrospinal fluid was drawn on the second day and found to contain virus At the time his fluid contained 540 cells per cubic millimeter Two days later the cells had increased to 950 per cubic millimeter

Unfortunately neither further trapping nor a survey of the residents of the building was feasible The frequency of infection without clinical signs suggests that many others may have been infected The experience is similar to that of Farmer and Janeway,[4] who learned from hospital records that the 4 recognized cases of choriomeningitis among Boston Negroes during a period of eight years had all occurred in one district It was discovered that all had lived within two blocks of one another In this instance the diagnosis in the 2 earliest cases rested on clinical records Virus was demonstrated in 1 patient and antibodies in another

The incidence of infected house mice appears to be variable Armstrong's [5] estimate for Washington, D C is 21 5 per cent, while Yamarat [6] found 4 per cent of the mice he trapped in Boston to be carriers Between September 1943 and October 1944 we examined 290 mice trapped in Greater New York [7] and found 11, or approximately 4 per cent, to be infected Eleven rats were examined and all proved to be avirulent Rats are relatively insusceptible to choriomeningitis and have *not been shown to carry virus in nature* [8]

It is worth noting that our results suggest small, persistent foci of infection The persistence of infection is readily understood from the observations showing in utero transmission [2] The limited size of the foci probably reflects the circumscribed range of mice [9] Thus the 11 infected mice we found were in four buildings, one store and three apartments Three were found in the former during the initial trapping and another eight months later A number of mice from adjoining buildings were free of virus A second trapping was also made in an apartment in which a carrier had been found The second collection likewise yielded an infected mouse

Mosquitoes,[10] ticks [11] and body lice [12] are capable of harboring choriomeningitis virus Farmer and Janeway [4] suggested that 1 of their patients might have been infected by a dog, but subsequent studies [13] have so far failed to demonstrate that dogs are carriers On the other hand, several reports have incriminated house mice [14]

SUMMARY

Three consecutive cases of choriomeningitis were noted among the residents of a multiple family dwelling which harbored infected mice A fourth case developed in a near neighbor

It would seem justifiable to make special efforts to search out colonies of infected mice in the premises of known cases of the disease, both to verify further the causal relationship and to identify what may be a persistent focus of infection

The incidence of choriomeningitis virus carriage in house mice in Greater New York was found to be approximately 4 per cent

eruption In many cases ammonium chloride must be used then Ammonium chloride is best prescribed in sour mixtures [3] in the manner presented in table 2

*Sedatives, Estrogens and Stramonium*—Fear is an important factor in the production of asthma Severe exhaustion and apprehension coupled with poor nervous stamina will increase the severity of an attack of asthma and will cause an attack to develop on slight provocation Likewise the loss of sleep brought about by repeated nocturnal attacks of asthma causes profound exhaustion For such patients small doses of phenobarbital are helpful Excessive sedation should be avoided, as it is important not to suppress the belabored respiratory center

For women who have premenstrual tension associated with exacerbation of their asthma, oral use of estrogens during the two weeks before menstruation may be necessary in addition to sedatives The continuous use of estrogens should be considered particularly for menopausal patients who have ceased menstruating and who have appreciable vasomotor instability

Use of opiates is mentioned to be condemned Although they ease the apprehension of the patient, they depress the respiratory center and in doing so place the patient in serious jeopardy of immediate death from respiratory failure Secondarily the closely associated cough center is suppressed at a time when raising secretions is of utmost importance

Another commonly used treatment which is mentioned because of its deleterious effect from a long-range point of view is the fumes from burning stramonium powder Temporary relief is obtained from this treatment, but bronchial irritation produced may cause further asthma at a later date If the patient has confidence in such treatments, it is a good practice not to deprive one who is seriously ill of this during the first day or so of hospital care The reason for this is to prevent the fear that withdrawal of such medication would induce

*Special Measures for Patients Who Are Critically Ill*—For critically ill patients such measures as intravenous administration of 1 cc of 1 1,000 solution of epinephrine in 1 liter of isotonic solution of sodium chloride given very slowly and the use of nikethamide or pentamethylene tetrazol (metrazol) may be necessary Such measures are employed only when respiratory failure is imminent They are particularly useful when morphine has been given before the patient has come under observation With respiratory failure the use of an inhalator will increase the respiratory excursion, and helium and oxygen mixtures should be used for inhalation therapy

*Diet*—In considering a diet for the seriously ill asthmatic patient, foods known to be poorly tolerated by that patient should be omitted A positive skin test alone is insufficient evidence to warrant the omission of nutritious foods from the diet of a patient In most cases a general tray may be served Subsequent modifications of this regimen may be introduced as their necessity becomes apparent Often a patient with an eye too closely fixed on reactions to skin tests will cause his health to suffer more through bizarre and inadequate diet than it might from the atopic disorders prompting such diets A light evening meal is preferred to a large meal Supplements of vitamins which appear indicated in an individual case should be given

## COMPLICATIONS

Complications of asthma frequently include bronchostenosis, bronchitis with fever and pneumonia The role of coexisting bronchostenosis should be suspected if the patient presents a history of recurrent febrile episodes associated with chills, if there is a history of unexplained hemoptysis or if examination of the chest reveals persistent suppression of breath sounds, especially in the bases of the lungs When any of these characteristic features is present, bronchoscopy is indicated after the acute phase of the asthma has subsided For bronchitis associated with fever and for pneumonia, sulfonamides or penicillin should be employed early Because many of these patients have associated emphysema, acute infectious processes represent a considerably greater hazard to the patient

A useful adjunct in the treatment of asthma in which bronchitis is an important etiologic factor may be had in a roentgen treatment to the bronchi Opinions that roentgen irradiation may exercise a beneficial effect on the chronically inflamed bronchial mucous membrane are accumulating [4]

As the patient improves, greater latitude in an evaluation of long-range factors affecting the asthma is possible An investigation of the allergies involved may be undertaken The presence of coexisting sinus disease may be determined If purulent discharge is seen in the nose, if a history of frequent head colds is obtained or if a yellow postnasal drip is noted, sinusitis should be suspected Roentgenographic examination of the sinuses should be made in all cases of asthma Active sinusitis should be eradicated by such measures as may prove to be indicated

## TREATMENT AFTER DISMISSAL FROM HOSPITAL

When finally the patient is dismissed from the hospital, it is well to outline a regimen which will include several items Methods for preparing a dustfree bedroom must be suggested Dustproof covers should be applied to the mattress and pillows in the patient's home This is done partly because of allergic factors and partly because dust serves as a respiratory irritant Caution concerning the irritation from a habit of coughing is at times warranted, although patients who raise quantities of sputum should be spared such admonitions The use of tobacco is contraindicated in most cases of asthma The addition of any irritation from tobacco to the bronchitis under treatment had best be avoided The medication employed to the time of the patient's dismissal from the hospital should be continued without interruption during the transition to home care This should include expectorant (if tolerated), ephedrine or ephedrine-like drugs and, if epinephrine has been required in quantity, use of nebulized epinephrine Certain patients should be instructed in the method of administering epinephrine hypodermically The availability of this form of treatment eases the patient's apprehension

## SUMMARY

We now have at our disposal many tried adjuncts in treatment of the patient who is seriously ill with asthma While not one of these is of recent introduction, the diligent application of these several measures will materially aid in the care of such a patient

## CHRONIC PORPHYRIA

Irving J. Taylor, M.D., Milton L. Solomon, M.D., Glenn S. Weiland, Ph.D. and Frank H. J. Figge, Ph.D., Baltimore

Porphyria, sometimes referred to by the obsolete term "hematoporphyrinuria," is a disease or a group of diseases associated with an intrinsic or inborn error of porphyrin metabolism. The three types recognized by most authorities[1] are (1) congenital, (2) acute and (3) chronic. Almost all of the reported cases of porphyria have occurred in Europe, and the small number of papers in this country have dealt mainly with the acute type[2] and, to a lesser extent, the congenital type. To our knowledge the only case of chronic porphyria which had been reported in this country proved to be a case of acute porphyria with mental symptoms,[3] hence the object of recording this case.

Nesbitt[2] has suggested that porphyria is not as uncommon as is indicated by the paucity of case reports and that if attention is focused on this disease more cases will be detected. The historical, chemical and clinical aspects of porphyria have been adequately reviewed in English by other investigators[4] in whose articles extensive bibliographies may be found. A summarizing table has been prepared to facilitate a discussion of the differentiation of the various types of porphyria. This also gives an isolated clear picture of the clinical symptoms associated with this group of diseases.

The three types of porphyria can be easily differentiated if the following facts are kept in mind. The original classification was based on the fact that in the acute variety the abnormal porphyrin excretion occurred intermittently or only during the acute attack. In the congenital and chronic forms, however, abnormal amounts of porphyrin are excreted continuously. These names are somewhat unfortunate because all three types are chronic diseases.

1. The congenital type is possibly inherited as a mendelian recessive.[3] Uroporphyrin type I is excreted predominantly and the classic clinical symptoms are a sensitivity of the skin to light (blistering resembling hydroa estivale). The teeth and bones are usually discolored with uroporphyrin, and the patients exhibit symptoms characteristic of endocrine disturbances.

2. The acute type of porphyria is inherited as a mendelian dominant[5] and, contrary to its name, is a chronic disease. Uroporphyrin type III is excreted in large amounts in the urine and feces during attacks. There is little or no light sensitivity, but abdominal, neurologic and mental symptoms are common manifestations.

3. Chronic porphyria includes those cases which cannot be classified as either congenital or acute but exhibit the clinical symptoms of both in a milder form. For example, in patients with chronic porphyria the skin is somewhat sensitive to light, and abdominal, nervous or mental symptoms may appear singly or in combination. Patients with this disease usually excrete large amounts of coproporphyrin III or a mixture of III and I, but uroporphyrin I and III have been isolated.[3] No information on the genetics of this type of porphyria could be found.

The attempt to include acute toxic porphyria in the classification[6] is not justified and indicates a superficial concept of the disease. This should be regarded as porphyrinuria caused by certain specific toxic substances or drugs.[5]

*Differentiation of Various Types of Porphyria*

| Type of Porphyria | Duration and Genetics | Type of Excess Porphyrin Excreted | Clinical Symptoms |
|---|---|---|---|
| Congenital | Inherited possibly as a mendelian recessive; may appear early in life, chronic disease | Uroporphyrin I with coproporphyrin I (excreted continuously) | Great photosensitivity and cutaneous manifestations resembling hydroa estivale in spring and summer appearing frequently in childhood; urine burgundy red with brown tinge, teeth and bones discolored by uroporphyrin I |
| Acute | Inherited as a mendelian dominant; chronic disease | Uroporphyrin III excreted in large amounts chiefly during attacks (reason for designation as acute); smaller amounts of coproporphyrin III or I found occasionally | No photosensitivity; no skin lesions; great variation in clinical picture; symptoms of three main types<br>1. Abdominal: severe cramplike pain, vomiting and constipation often with slight fever, hypertension and tachycardia<br>2. Nervous: symmetrical ascending myelitis (Landry's) sometimes with neuritis<br>3. Mental: any type of psychic disturbance; urine during attack usually red but may be light straw colored, darkening on exposure |
| Chronic | Chronic disease | Mixtures of coproporphyrin III and I or uroporphyrin I and III | Slight photosensitivity; some skin lesions, abdominal pains and symptoms; it thus resembles congenital porphyria in some respects and acute porphyria in others |

### REPORT OF CASE

*History*.—A white woman aged 20, married, a native of Baltimore, was admitted to the West Baltimore General Hospital on Nov. 5, 1944 with the chief complaint of severe generalized abdominal pain with nausea and vomiting. The present illness began on Aug. 1, 1944 while she was visiting her husband at a Marine station in North Carolina. At this time she noticed vesicles which itched intensely on the knuckles of both hands. In the next two weeks this spread half-way up the dorsum of the forearms. One month later vesicles began to appear on her face. A sulfonamide (one tablet four times a day) was taken for one week, starting about September 25. Vitamins A and $B_1$ were then tried for about one month. Acetylsalicylic acid was taken on numerous occasions, but this drug had been used previously with no untoward reactions. No sleeping tablets were necessary.

Since this medication appeared to be of no value, the patient consulted a dermatologist two weeks prior to admission, again without obtaining relief. Four days prior to admission, because the skin condition had not improved, she was given calcium gluconate intravenously with no noticeable effect. A second injection of calcium gluconate was given two days prior to admission. On the morning just prior to this injection the patient first noticed generalized abdominal pain and nausea. This persisted and was accompanied by vomiting during the twenty-four hours before admission to the hospital. The vomiting was so severe that the patient was able to retain nothing but tea. On the day of admission the patient first

Dr. Taylor is now in the Army of the United States.

noticed urgency and frequency of urination, with much difficulty in initiating the flow

The family history was noncontributory No relative had ever shown similar symptoms or exhibited any allergy

The past history revealed only childhood diseases, such as chickenpox, measles, whooping cough and the mumps The patient worked in a paint factory handling titanium dioxide and later in 1943-1944 in a factory where she used a chemical called "glycthol" to solder tops on metal tubes This so-called solder is a plastic and contains no lead, benzene or other known toxic material

A review of the symptoms was noncontributory No history of asthma, hay fever, food or drug allergy was obtained There were no previous urinary symptoms

*Physical Examination*—On admission the rectal temperature was 100 4 F, the pulse rate was 90, the respiratory rate was 20, the blood pressure 120/80 and the weight 112 pounds (51 Kg) The patient appeared to be well developed and well nourished and looked acutely ill The respirations were full but quite deep in character The lips appeared red There was a skin eruption consisting of a few unbroken vesicles with mostly excoriations, superimposed pustules and crusts over the dorsum of the forearms and hands, the face, the forehead and the anterior part of the neck The remainder of her body was unaffected Examination of the abdomen revealed a diffuse extreme tenderness but no spasm or rigidity There was no rebound tenderness, and no organs or masses were palpable. There was no costovertebral angle tenderness or tenderness on percussion over or alongside the spinal column A complete neurologic examination was negative. Pelvic and rectal examinations revealed no abnormality

*Course in Hospital*—The patient was believed at first to have a virus infection involving the nerve roots and a skin eruption of unknown etiology limited to the exposed areas A plasma carbon dioxide was found to be 40 volumes per cent and sodium r-lactate was administered parenterally The normal menstrual flow started two days after admission and the abdominal cramps and urinary urgency, although still present at that time, had subsided considerably The flow stopped four days after its onset. However, three days later the patient had a small amount of vaginal bleeding

Spectroscopic examination of a twenty-four hour specimen of the patient's urine on the third hospital day revealed absorption bands characteristic of porphyrin, and 1,635 micrograms of ether-soluble porphyrin was extracted. The urine collected the following day yielded 1,248 micrograms of porphyrin

The following therapy was then instituted The patient was given calcium lactate 40 grains (2 6 Gm), sodium bicarbonate 80 grains (5 2 Gm.) and riboflavin 40 mg by mouth daily One fourth of this daily dose was administered with 200 cc. of an imperial drink every six hours In addition, one ampule of Solu B was given intravenously [7] and 5 cc. of crude liver extract was administered intramuscularly daily This treatment was suggested by a review [8] of methods used to treat porphyria patients, but the dosages which were used in this case were much higher than those used by other investigators The riboflavin was thus used as a drug and not to satisfy the normal requirement. The urinary porphyrin excretion was followed for the next twelve days and found to vary between 300 and 1,045 micrograms per day

During the first four weeks in the hospital the patient required isonipecaine or codeine at least one or more times a day (less terminally than initially) for relief of severe abdominal cramps By the ninth hospital day the patient became almost free from urinary urgency, but on that day she experienced an especially severe attack of abdominal cramps, made worse by pressure on the abdomen She also complained of severe pain in the right sacroiliac region and diffuse leg aches which were not relieved by 1 gram (0 06 Gm.) of codeine administered hypodermically but were relieved by 100 mg of isonipecaine.

Ultraviolet radiation was applied on the ninth hospital day to a clear area the size of a quarter (24 mm) on the dorsum of the right forearm in order to see if the patient was sensitive to this radiation The unfiltered radiation from a therapeutic quartz mercury arc lamp at a distance of 2 feet was applied for ten minutes, but no skin lesions resulted This dosage of light may have been too small to elicit a response. The apparent lack of light sensitivity seemed incompatible with the observation that all skin lesions occurred on areas normally exposed to light

By the tenth day the abdominal and right back pains were present only at intervals, and two days later she was able to sleep about half the night without any pain

The patient was examined under near ultraviolet light,[9] and about half of the skin lesions exhibited a bright reddish orange fluorescent glow This red fluorescent glow was especially noticeable on the most recent lesions and more noticeable on those which had been weeping during the previous twenty-four hours Along the nasolabial grooves, the sebaceous secretions

Fig 1—Appearance of patient with chronic porphyria one year after the onset of the disease Most of the lesions which appear dark in this and in figure 2 were red fluorescent when examined in near ultraviolet light Many of the scarred areas do not show in the illustrations The slight enlargement of the thyroid which is evident developed after the patient became pregnant

stood out as pearly, round, bright orange-red fluorescent puncta. The tongue also showed a brilliant red fluorescence over its entire surface The skin, mucous membranes, teeth and nails fluoresced normally The patient suffered no new skin lesions immediately after this fluorescence examination, but several days later three new skin vesicles were noted on the dorsum of the hands At this time the abdominal pains were of shorter duration and much less severe but usually appeared with low back pain in the evenings The urinary urgency and leg pains disappeared at this time and never recurred In the next three days the patient had only two minor episodes of abdominal pain, and she was permitted up in a wheel chair on the fiftieth hospital day Up until this time there had been no itching of the skin lesions However, it was now noted that the patient had scratched her forearms while asleep. ## CHRONIC PORPHYRIA

Irving J Taylor M D, Milton L. Solomon M D, Glenn S Weiland, Ph D, and Frank H J Figge Ph D Baltimore

Porphyria, sometimes referred to by the obsolete term "hematoporphyrinuria," is a disease or a group of diseases associated with an intrinsic or inborn error of porphyrin metabolism. The three types recognized by most authorities [1] are (1) congenital, (2) acute and (3) chronic. Almost all of the reported cases of porphyria have occurred in Europe, and the small number of papers in this country have dealt mainly with the acute type [2] and, to a lesser extent, the congenital type. To our knowledge the only case of chronic porphyria which had been reported in this country proved to be a case of acute porphyria with mental symptoms, [3] hence the object of recording this case.

Nesbitt [2] has suggested that porphyria is not as uncommon as is indicated by the paucity of case reports, and that if attention is focused on this disease more cases will be detected. The historical, chemical and clinical aspects of porphyria have been adequately reviewed in English by other investigators, [4] in whose articles extensive bibliographies may be found A summarizing table has been prepared to facilitate a discussion of the differentiation of the various types of porphyria This also gives an isolated clear picture of the clinical symptoms associated with this group of diseases

The three types of porphyria can be easily differentiated if the following facts are kept in mind The original classification was based on the fact that in the acute variety the abnormal porphyrin excretion occurred intermittently or only during the acute attack. In the congenital and chronic forms, however, abnormal amounts of porphyrin are excreted continuously These names are somewhat unfortunate because all three types are chronic diseases

1 The congenital type is possibly inherited as a mendelian recessive [3] Uroporphyrin type I is excreted predominantly and the classic clinical symptoms are a sensitivity of the skin to light (blistering resembling hydroa estivale) The teeth and bones are usually discolored with uroporphyrin, and the patients exhibit symptoms characteristic of endocrine disturbances

2 The acute type of porphyria is inherited as a mendelian dominant [5] and, contrary to its name, is a chronic disease Uroporphyrin type III is excreted in large amounts in the urine and feces during attacks There is little or no light sensitivity, but abdominal, neurologic and mental symptoms are common manifestations

3 Chronic porphyria includes those cases which cannot be classified as either congenital or acute but exhibit the clinical symptoms of both in a milder form For example, in patients with chronic porphyria the skin is somewhat sensitive to light, and abdominal, nervous or mental symptoms may appear singly or in combination Patients with this disease usually excrete large amounts of coproporphyrin III or a mixture of III and I, but uroporphyrin I and III have been isolated. [3] No information on the genetics of this type of porphyria could be found

The attempt to include acute toxic porphyria in the classification [6] is not justified and indicates a superficial concept of the disease. This should be regarded as porphyrinuria caused by certain specific toxic substances or drugs [5]

*Differentiation of Various Types of Porphyria*

| Type of Porphyria | Duration and Genetics | Type of Excess Porphyrin Excreted | Clinical Symptoms |
|---|---|---|---|
| Congenital | Inherited possibly as a mendelian recessive may appear early in life chronic disease | Uroporphyrin I with coproporphyrin I (excreted continuously) | Great photosensitivity and cutaneous manifestations resembling 'hydroa estivale' in spring and summer appearing frequently in childhood urine burgundy red with brown tinge teeth and bones discolored by uroporphyrin I |
| Acute | Inherited as a mendelian dominant chronic disease | Uroporphyrin III excreted in large amounts chiefly during attacks (reason for designation as acute) smaller amounts of coproporphyrin III or I found occasionally | No photosensitivity, no skin lesions, great variation in clinical picture symptoms of three main types<br>1 Abdominal severe crampllke pain vomiting and constipation often with slight fever hypertension and tachycardia<br>2 Nervous symmetrical ascending myelitis (Landry s) sometimes with neuritis<br>3 Mental any type of psychic disturbance urine during attack usually red but may be light straw colored darkening on exposure |
| Chronic | Chronic disease | Mixtures of coproporphyrin III and I or uroporphyrin I and III | Slight photosensitivity some skin lesions abdominal pains and symptoms it thus resembles congenital porphyria in some respects and acute porphyria in others |

### REPORT OF CASE

*History*—A white woman aged 20, married, a native of Baltimore, was admitted to the West Baltimore General Hospital on Nov 5, 1944 with the chief complaint of severe generalized abdominal pain with nausea and vomiting The present illness began on Aug 1, 1944 while she was visiting her husband at a Marine station in North Carolina At this time she noticed vesicles which itched intensely on the knuckles of both hands In the next two weeks this spread half way up the dorsum of the forearms One month later vesicles began to appear on her face. A sulfonamide (one tablet four times a day) was taken for one week, starting about September 25 Vitamins A and $B_1$ were then tried for about one month. Acetylsalicylic acid was taken on numerous occasions, but this drug had been used previously with no untoward reactions No sleeping tablets were necessary

Since this medication appeared to be of no value, the patient consulted a dermatologist two weeks prior to admission again without obtaining relief Four days prior to admission, because the skin condition had not improved, she was given calcium gluconate intravenously with no noticeable effect. A second injection of calcium gluconate was given two days prior to admission On the morning just prior to this injection the patient first noticed generalized abdominal pain and nausea This persisted and was accompanied by vomiting during the twenty-four hours before admission to the hospital The vomiting was so severe that the patient was able to retain nothing but tea On the day of admission the patient first

Dr Taylor is now in the Army of the United States
From the West Baltimore General Hospital and the University of Maryland School of Medicine
This work was aided by grants from the Anna Fuller Fund and the International Cancer Research Foundation

noticed urgency and frequency of urination, with much difficulty in initiating the flow

The family history was noncontributory No relative had ever shown similar symptoms or exhibited any allergy

The past history revealed only childhood diseases, such as chickenpox, measles, whooping cough and the mumps The patient worked in a paint factory handling titanium dioxide and later in 1943-1944 in a factory where she used a chemical called "glypthol" to solder tops on metal tubes This so called solder is a plastic and contains no lead, benzene or other known toxic material

A review of the symptoms was noncontributory No history of asthma, hay fever, food or drug allergy was obtained There were no previous urinary symptoms

*Physical Examination*—On admission the rectal temperature was 100 4 F, the pulse rate was 90, the respiratory rate was 20, the blood pressure 120/80 and the weight 112 pounds (51 Kg) The patient appeared to be well developed and well nourished and looked acutely ill The respirations were full but quite deep in character The lips appeared red There was a skin eruption consisting of a few unbroken vesicles with mostly excoriations, superimposed pustules and crusts over the dorsum of the forearms and hands, the face, the forehead and the anterior part of the neck The remainder of her body was unaffected Examination of the abdomen revealed a diffuse extreme tenderness but no spasm or rigidity There was no rebound tenderness, and no organs or masses were palpable There was no costovertebral angle tenderness or tenderness on percussion over or alongside the spinal column A complete neurologic examination was negative. Pelvic and rectal examinations revealed no abnormality

*Course in Hospital*—The patient was believed at first to have a virus infection involving the nerve roots and a skin eruption of unknown etiology limited to the exposed areas A plasma carbon dioxide was found to be 40 volumes per cent and sodium r-lactate was administered parenterally The normal menstrual flow started two days after admission and the abdominal cramps and urinary urgency, although still present at that time, had subsided considerably The flow stopped four days after its onset. However, three days later the patient had a small amount of vaginal bleeding

Spectroscopic examination of a twenty-four hour specimen of the patient's urine on the third hospital day revealed absorption bands characteristic of porphyrin, and 1,635 micrograms of ether-soluble porphyrin was extracted. The urine collected the following day yielded 1,248 micrograms of porphyrin

The following therapy was then instituted The patient was given calcium lactate 40 grains (2 6 Gm), sodium bicarbonate 80 grains (5.2 Gm) and riboflavin 40 mg by mouth daily One fourth of this daily dose was administered with 200 cc. of an imperial drink every six hours In addition, one ampule of Solu B was given intravenously [7] and 5 cc. of crude liver extract was administered intramuscularly daily This treatment was suggested by a review [8] of methods used to treat porphyria patients, but the dosages which were used in this case were much higher than those used by other investigators The riboflavin was thus used as a drug and not to satisfy the normal requirement. The urinary porphyrin excretion was followed for the next twelve days and found to vary between 300 and 1,045 micrograms per day

During the first four weeks in the hospital the patient required isonipecaine or codeine at least one or more times a day (less terminally than initially) for relief of severe abdominal cramps By the ninth hospital day the patient became almost free from urinary urgency, but on that day she experienced an especially severe attack of abdominal cramps, made worse by pressure on the abdomen She also complained of severe pain in the right sacroiliac region and diffuse leg aches which were not relieved by 1 grain (0 06 Gm) of codeine administered hypodermically but were relieved by 100 mg of isonipecaine.

Ultraviolet radiation was applied on the ninth hospital day to a clear area the size of a quarter (24 mm) on the dorsum of the right forearm in order to see if the patient was sensitive to this radiation The unfiltered radiation from a therapeutic quartz mercury arc lamp at a distance of 2 feet was applied for ten minutes, but no skin lesions resulted This dosage of light may have been too small to elicit a response The apparent lack of light sensitivity seemed incompatible with the observation that all skin lesions occurred on areas normally exposed to light

By the tenth day the abdominal and right back pains were present only at intervals, and two days later she was able to sleep about half the night without any pain

The patient was examined under near ultraviolet light,[9] and about half of the skin lesions exhibited a bright reddish orange fluorescent glow This red fluorescent glow was especially noticeable on the most recent lesions and more noticeable on those which had been weeping during the previous twenty-four hours Along the nasolabial grooves, the sebaceous secretions

Fig 1—Appearance of patient with chronic porphyria one year after the onset of the disease Most of the lesions which appear dark in this and in figure 2 were red fluorescent when examined in near ultraviolet light. Many of the scarred areas do not show in the illustrations The slight enlargement of the thyroid which is evident developed after the patient became pregnant.

stood out as pearly, round, bright orange-red fluorescent puncta. The tongue also showed a brilliant red fluorescence over its entire surface. The skin, mucous membranes, teeth and nails fluoresced normally The patient suffered no new skin lesions immediately after this fluorescence examination, but several days later three new skin vesicles were noted on the dorsum of the hands At this time the abdominal pains were of shorter duration and much less severe but usually appeared with low back pain in the evenings The urinary urgency and leg pains disappeared at this time and never recurred. In the next three days the patient had only two minor episodes of abdominal pain, and she was permitted up in a wheel chair on the fiftieth hospital day Up until this time there had been no itching of the skin lesions However, it was now noted that the patient had scratched her forearms while asleep. From this time until her discharge on the sixty-third hospital day the patient was asympto-

matic except for the appearance of new itching skin vesicles about every other day on the face and dorsum of her hands At the time of her discharge from the hospital her condition was much improved. The medication mentioned earlier has been maintained since discharge with only slight interruption The Solu B injections were, however, reduced from one a day to only two a week and finally to one a week.

*Laboratory and X-Ray Findings*—Examination of the blood on admission showed a red cell count of 4,010,000 with 79 per cent of hemoglobin and a white cell count of 7,500 with 60 per cent neutrophils and 40 per cent lymphocytes This was repeated a week later with similar results The plasma carbon dioxide combining power on admission was 40 volumes per cent The blood cholesterol was 230 mg per hundred cubic centimeters The icterus index on admission was 11 and the direct van den Bergh was negative, while the indirect showed a slight trace. Two days later a repeat icterus index was 8 3 A sulfobromophthalein liver function test was done every two weeks between November 1944 and April 1945 The initial sulfobromophthalein test revealed 20 per cent retention with 5 mg of the dye per kilogram of body weight, a blood sample being withdrawn in forty-five minutes In the following two months this dropped gradually to a 2 per cent retention but jumped two weeks later,

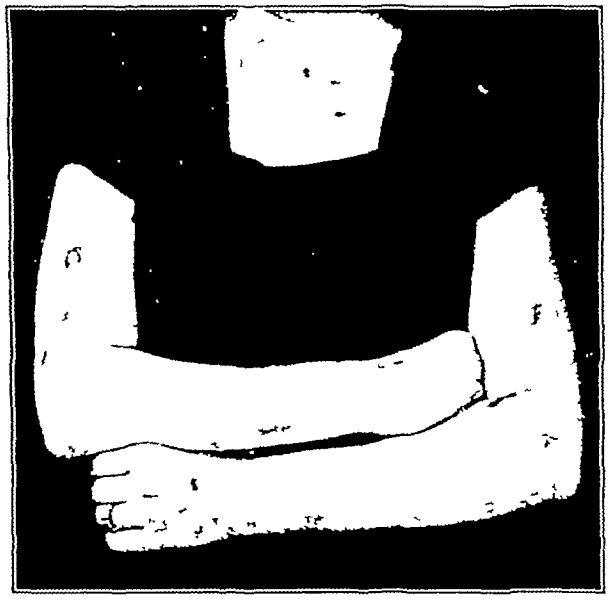

Fig 2—Lesions on arms.

after discharge from the hospital, to 32 per cent. Within two more months this had again dropped to 2 per cent. The cephalin flocculation, galactose tolerance test, total protein and albumin-globulin ratio, serum calcium, phosphorus and alkaline phosphatase values were normal Urinalysis was negative at all times The spinal fluid showed no abnormalities

X-ray studies of the gastrointestinal tract during a period of moderate abdominal cramps revealed much of the barium in the upper half of the small intestine on the five minute film The upper part of the small intestine was hypermotile especially around the pyloric area and the jejunum The remainder of the intestinal tract showed sluggish motility with barium in the lower small intestine at the end of eight hours At twenty-eight hours all of the barium was in the ascending and right half of the transverse colon, where it appeared to be stopped by spasm. A barium enema was given while the patient was entirely free from abdominal pain and revealed no abnormality

### ISOLATION, DETERMINATION AND IDENTIFICATION OF PORPHYRIN EXCRETED IN URINE

The urine collected over twenty-four hour periods was reddish brown, and the porphyrin could be detected spectroscopically but not by fluorescence in near ultraviolet light. Definite absorption bands could be observed at 6,140, 5,730 and 5 350 angstroms The red fluorescence of the porphyrin in the urine was not apparent because of the presence of an abundance of substances that were so intensely blue fluorescent that they suppressed the weaker red fluorescence. Dobriner's methods [8] of extraction of urinary porphyrins were used with minor modifications The porphyrin was separated from the urine by adsorption on the precipitate which forms when sodium hydroxide and calcium chloride are added to the urine. After filtration this precipitate containing the porphyrins was dissolved in hydrochloric acid and adjusted to $p_H$ 2 7-3 0 or until neutral to congo red The main fraction of the porphyrin was then extracted with ether and further purified by passing back and forth from ether to 10 per cent hydrochloric acid and finally into 25 per cent hydrochloric acid. Spectroscopic examination revealed that the absorption bands of this ether-soluble porphyrin in ether and in 25 per cent hydrochloric acid coincided with the known values for coproporphyrin [10] and with the absorption bands of a sample of synthetic coproporphyrin The fact that it was soluble in 20 per cent sodium hydroxide also indicated that the predominant porphyrin was coproporphyrin These ether-soluble fractions, representing the total urine collected over a period of fourteen days, were pooled and further purified and fractionated to determine the melting points of the methyl esters

The neutralized aqueous solutions that had been extracted with ether were examined spectroscopically for uroporphyrin In some of these it was thought that the absorption bands of uroporphyrin could be detected. However, the position of the absorption bands of uroporphyrin and coproporphyrin are so similar that absorption spectrums cannot be relied on to differentiate these two pigments Careful extraction of these aqueous solutions with more ether removed additional small amounts of coproporphyrin No definite evidence indicating the presence of uroporphyrin was obtained

The ether-soluble porphyrins which had been isolated as described were pooled and converted to their methyl esters by the conventional methanol-hydrochloric acid procedure. Considerable material was lost in unsuccessful attempts to separate the methyl esters of the isomeric coproporphyrins I and III by the anhydrous ether method of Rimington [11] and by adsorption on alumina. Using anhydrous methanol as recommended by Dobriner,[12] the alcohol insoluble fraction yielded a substance melting at 235-238 C. This corresponds to the values reported in the literature [8] for the melting point of the methyl ester of coproporphyrin I isolated from natural sources The pure synthetic ester melts at 248-252 C. The absorption spectrum in chloroform was found to be in agreement with the values given in the literature for coproporphyrin methyl ester From the methanol soluble fraction there were secured crystals melting at 125-135 C Repeated attempts to raise the melting point by recrystallizing were not successful, probably because of the small amount of substance available. The pure synthetic ester of coproporphyrin III shows a double melting point at 135 or 142 and 167-170 C. The absorption spectrum of this material in chloroform also agreed with that of the coproporphyrin I methyl ester, leaving little doubt that it was impure coproporphyrin III ester It was therefore concluded that the patient was excreting a mixture of coproporphyrin III and coproporphyrin I

*Posthospital Record*—The patient has thus far been followed for one year after discharge. For the first four months she had biweekly sulfobromophthalein liver function tests which varied between 2 and 32 per cent retention She continued to be free from gastrointestinal symptoms until three and one-half months after her hospital discharge when she experienced a moderately severe continuous pain in the entire left abdomen lasting over twelve hours She slept well but awakened in the morning with a somewhat milder pain in the right lower quadrant lasting half a day This was followed by intermittent epigastric pains which disappeared entirely by bedtime. After this there was no recurrence of abdominal pain, however, there was a bloated feeling accompanied by a meager appetite for a week. There was no nausea, vomiting or bladder difficulty at any time after the patient's discharge from the hospital For the first six months following discharge the patient experi-

10 Fischer H and Orth H Die Chemie des Pyrrols Leipzig Akademische Verlagsgesellschaft m b H., 1937 vol 2 pt. 1 p. 764

12. Dobriner, Konrad Porphyrin Excretion in the Feces in Normal and Pathological Condition J Biol Chem. 120: 115 127 1937

enced no new skin lesions on her face, neck or legs The old lesions had healed and had left almost undetectable pockmarks On her forearms and hands she was not so fortunate, however, and new lesions appeared sporadically except for a period of two weeks, when the patient wore a long-sleeved dress and gloves During June 1945 she developed numerous new vesicles on the hands and arms in spite of trying to protect the exposed areas with gloves

The patient had been advised to avoid becoming pregnant because of the uncertain influence that this might have on the prognosis and because the other types of porphyria appear to be inheritable In June 1945 it was discovered, however, that she had become pregnant approximately two months previously By this time she had improved to such a degree that the discontinuance of the Solu B and liver injections was contemplated and tried for one month Either because of this discontinuance of treatment or for other reasons, the patient became much worse and a therapeutic abortion was contemplated but not carried out There appeared to be no record of a similar case of chronic porphyria complicated by pregnancy The Solu B and liver injections were therefore started again At this writing the patient has been pregnant for six months and is feeling relatively well The skin lesions continue to appear, however, on the legs and arms and sometimes on the face. They become secondarily infected from scratching and heal slowly An attempt is being made at present to treat these with penicillin applied locally and ointments containing local anesthetics Examination of the urine fourteen months after the onset of the disease reveals that large quantities of porphyrin are still being excreted

### COMMENT

The initial diagnosis of porphyria in this instance was made on the basis of skin lesions limited to exposed areas and the reddish brown urine which, when examined, was found to contain relatively large amounts of porphyrin The specific diagnosis of chronic porphyria was, however, based on these facts. The clinical symptoms (severe generalized abdominal pain along with skin lesions on exposed areas) did not coincide with those observed in either congenital or acute but resembled those of both types of porphyria When the porphyrin excreted in this case was finally isolated and identified by means of the melting point, spectroscopic examination and solubility tests it was found to be a mixture of coproporphyrin III and coproporphyrin I This again would not be characteristic of either congenital porphyria, in which uroporphyrin I is excreted, or of acute porphyhia, in which uroporphyrin III predominates in the urine. The excretion of excessive amounts of coproporphyrin in the urine has continued unabated for over one year during which time the patient has been isolated from possible toxic agents in factories or at home This has ruled out the possibility that the disease was only a severe porphyrinuria of toxic origin

It is true that predisposing factors or the disease in a latent form may have existed in this patient at birth but were set off at the age of 20 years by one of the following factors 1 Work in a factory environment containing some allergen or other agents such as titanium dioxide or plastic solvents that were specifically toxic to the patient. 2 The administration of a sulfonamide drug The skin lesions were present before any drugs were given, so that there is good reason to believe that the porphyria existed before the sulfonamide drug was taken. Since, however, the patient was not under our observation at this stage of the disease and no urinary porphyrin determinations were made prior to the administration of the sulfonamide drug, we cannot rule out the possibility that this was responsible for starting the excretion of excess porphyrins [13] The continued excretion of porphyrin for over a year after the discontinuance of the sulfonamide also makes such a hypothesis untenable. In some experiments in which sulfonamides were administered to a group of over 1,000 mice, 3 of the 4 siblings in one litter developed porphyria so severe that the teeth and bones became red fluorescent.[14] Attempts to repeat this have been unsuccessful

13 Figge, F H J Carey T N and Weiland G S To be published. Dobriner and Rhoads[2] Rimington and Hemmings[11]
14 Figge F H J Unpublished data

For some time after the treatment was started, skin lesions continued to appear on the legs, ankles and hands of the patient, but none appeared on the face This was perplexing because the face was apparently exposed to as much light as the hands and ankles More recently, however, new lesions appeared on the face in spite of the fact that an attempt has been made to keep exposure to sunlight to a minimum Application of suntan lotions likewise failed to prevent the appearance of some skin lesions

The treatment in this case seems to alleviate the most distressing symptoms but does not prevent either the photosensitivity or the increased porphyrin excretion Recently the vitamin C intake of the patient has been increased to 400 mg per day Vitamin C therapy was originally suggested by Dobriner [15]

### SUMMARY

Chronic porphyria, a disease associated with an inborn error of porphyrin metabolism, was observed in a woman aged 20 In this case the outstanding symptoms were the severe generalized abdominal pain associated with red fluorescent skin lesions on exposed areas The patient has excreted 300 to 1,600 micrograms of coproporphyrin I and III daily for over one year Porphyria is probably not as rare as the reports of cases would lead one to believe and should be kept in mind when considering cases with mental, cutaneous, neurologic or abdominal symptoms

## COMMON DUCT STONE RELIEVED BY INJECTION OF NUPERCAINE SOLUTION INTO T TUBE

FRANKLIN I HARRIS M D and SANFORD A MARCUS M D
San Francisco

The management of a persistent common duct stone following cholecystectomy and choledochostomy is a particularly vexing problem to the surgeon, for it frequently demands further operative intervention and, at the least, prolongs the period of convalescence. Several methods of removing these stones have been advanced, among them the systemic and local (intraduodenal) use of autonomic drugs,[1] the use of nitrites [2] various regimens involving flushing through the T tube and the so called "physiologic flush" of Best,[3] which includes the administration of the nitrites, antispasmodics, bile salts and fatty foods as well as direct T tube irrigation. Ether,[4] chloroform [5] and recently solution G," [6] containing citric acid, have all been employed in an attempt to dissolve or dislodge the stones

The presence of a stone in the duct causes a reflex spasm of the sphincters of Boyden and Oddi, [7] likewise there has been noted the production of a traumatic cholangitis with mucosal edema, both of which phenomena tend to grasp the stone more firmly and to maintain the obstruction.

In a case of this type, in which the presence of a persistent stone had been established postoperatively by cholangiography and all accepted methods had failed to dislodge it, it was suggested by Dr Ralph Rabinowitz, internist that a method

might be employed which arrests the spastic reflex at its receptor end and permits the stone to be dislodged, either through the tube or through the relaxed sphincters It was decided to use a nontoxic, topical anesthetic agent to achieve this effect. The urologists have long used such agents [8] in the urinary tract, not only to diminish subjective unpleasantness during instrumentation, but to reduce spasm of the smooth muscle in cases of inflammation (e g urethritis, bladder stone) One of the solutions most widely used has been nupercaine in a concentration of 1 1,000 to 1 500 No record of its use in the common duct has been encountered

### REPORT OF CASE

A white man aged 49, a physician, had a long history of right upper quadrant pain associated with the presence of a palpable mass in that region, nausea and vomiting His icterus index at the time of admission was 26 units At operation an acutely diseased gallbladder was found, and exploration of the common duct revealed many gravel like stones A T tube was placed in the duct following removal of the gallbladder

Postoperatively the course was marked by attacks of pain in the right upper quadrant whenever the T tube was clamped or when more than 8 or 10 cc of saline solution was instilled into it Referral of pain to the substernal region was likewise noted The saline solution was always returned bile stained, indicating that it did not go through the sphincter Stools were consistently clay colored Cholangiograms which were taken on the thirteenth and nineteenth postoperative days (fig 1) revealed an absolute block at the sphincter of Oddi, with the presence of a curved shadow in this region suggesting a nonopaque stone Despite several days of treatment with the Best regimen (nitrites, antispasmodics and bile salts, with oil

Fig 1.—Cholangiogram taken on the nineteenth postoperative day after unsuccessful attempts to relieve the obstruction by frequent irrigations and by the Best regimen

and saline irrigations of the tube) there was no progress made in dislodging the obstruction

On the twentieth postoperative day approximately 10 cc. of sterile nupercaine solution in a strength of 1 500 was instilled into the tube, which was then clamped for twelve minutes, following which the tube was again gently irrigated with warm saline solution, 50 cc of which was instilled without evidence of the pain which had regularly occurred following the administration of only 8 or 10 cc. On the basis of the subjective relief of the patient, and because the injected fluid could no

Fig 2.—Cholangiogram taken after instillation of nupercaine solution into duct showing complete disappearance of obstruction and free flow of dye into duodenum

longer be reaspirated from the tube, it became evident that the obstruction was no longer present, and this was confirmed by a cholangiogram taken a few hours later (fig 2) With the finding of a completely patent common duct it was possible to remove the T tube, and after a progressively improving hospital course the patient was discharged in good condition.

### COMMENT

Relief experienced by the patient after the instillation of the anesthetic solution into the common duct as well as the ease with which the irrigation of saline solution passed through the duct into the duodenum, compared with previous attempts, makes us feel certain that the anesthetic solution was the responsible factor Although it is hoped to confirm these findings later with experimental work on animals, it was thought that this case report should be submitted so that other surgeons might try this harmless method clinically

It is also suggested that a topical anesthetic solution, such as nupercaine, be used by surgeons during the operative exploration of the common duct. The instillation of such a solution should relax the sphincter of Oddi and allow an easy, nontraumatic dilatation

### SUMMARY

1 A new method has been developed for the treatment of persistent postoperative common duct stones

2 Based on the premise that these stones cause a reflex spasm of the sphincters, an attempt has been made to arrest this reflex at its receptor end by the instillation of a topical anesthetic solution (nupercaine 1 500) directly into the common duct.

450 Sutter Street.

# OFFICIAL STATEMENT CONCERNING STREPTOMYCIN

CHESTER S KEEFER M D
Chairman Committee on Chemotherapeutics and Other Agents of the National Research Council
Boston

Many recent publications describing the effects of streptomycin have created so much interest and so many demands for it that the medical profession and public should be informed of the arrangements now in effect to adjust the present very limited supply to a program of clinical investigation

The Committee on Chemotherapeutics and Other Agents of the National Research Council, at the request of the Civilian Production Administration and the Streptomycin Producers Advisory Committee, is supervising an investigation of the clinical usefulness and possible toxicity of streptomycin The primary interest of the committee in streptomycin is to determine its effectiveness and toxicity in certain infections which are not susceptible to treatment with sulfonamides, penicillin and other therapeutic agents

The introduction of streptomycin to the medical profession is so recent that much remains to be learned concerning limitations of its usefulness, methods of administration, dosage, toxicity, and so on Most of the information obtained so far has issued from military and civilian hospitals as a result of clinical investigations which have been carried out under arrangements between producers of streptomycin and individual clinical investigators Similar studies are being continued and amplified by the Committee on Chemotherapeutics and Other Agents of the National Research Council, and a fraction of the streptomycin is now being allocated to the committee for these purposes It is placed in charge of the chairman for distribution to those hospital physicians most competent to obtain the vitally needed information

In addition to the group of accredited investigators, individual physicians have been included in the research program when they have patients with diseases which are being studied by the committee Full information concerning the bacteriologic diagnosis of the case is required, and when streptomycin is allotted it is with the understanding that a full report of the case is to be returned to the committee for analysis and that all unused material is to be returned for use in other suitable cases

Because of the restricted supply of streptomycin, it is obvious that patients selected to receive it must be those whom it can be expected to benefit and from whose treatment useful, needed information can be derived Under present conditions many requests will inevitably have to be refused

Following is a list of the diseases which are under investigation, together with a list of those which are not being investigated

### DISEASES WHICH ARE TO BE INVESTIGATED WITH STREPTOMYCIN UNDER THE COMMITTEE

1 *Gram negative bacillary infections of the genitourinary tract resistant to the sulfonamides*
2 Gram negative bacillary infections with bacteremia
3 Hemophilus influenzae infections, including meningitis, pneumonia, middle ear disease and laryngotracheitis
4 Friedlander's bacillus (Klebsiella pneumoniae) pneumonia
5 Typhoid
6 Salmonella infections (paratyphoid)
7 Acute brucellosis with bacteremia
8 Tularemia
9 Bacterial endocarditis due to gram negative bacilli

### DISEASES WHICH ARE NOT BEING INVESTIGATED BY THE COMMITTEE AT PRESENT

1 Chronic idiopathic ulcerative colitis
2 Lupus erythematosis acutus disseminatus
3 Leukemia
4 *Cancer*
5 Fever of unknown cause
6 Rheumatic fever
7 Rheumatoid arthritis

### TUBERCULOSIS

For the present only those cases of tuberculosis which were already under treatment prior to March 1, 1946 are being studied A broader program for the study of tuberculosis is planned, but it cannot be undertaken at the present time because of inadequate supplies of streptomycin It is the hope of the Committee on Chemotherapeutics and Other Agents to explore this problem further The medical profession will be kept informed of developments

### PROCUREMENT AND ALLOCATION OF STREPTOMYCIN

All streptomycin now being produced must be reported to the Civilian Production Administration for allocation by it Allocations are made to the Army, Navy, U S Public Health Service, Veterans Administration and the National Research Council after discussion of the needs of each and adjustment of the available supply to those needs

No one other than the agencies named may purchase streptomycin No patient who receives it may pay for it No physician is charged for it

The present program of clinical research is being conducted by the concerted efforts of the government, streptomycin producers, the National Research Council and civilian medical scientists of the highest standing with the sole purpose of obtaining the necessary information concerning streptomycin in the shortest possible time The program of the National Research Council is being supported by grants in aid from eleven pharmaceutical and chemical companies

### MEMBERS OF COMMITTEE

The members of the committee are

Chester S Keefer, Chairman, 65 East Newton Street, Boston,

John S Lockwood, Secretary, Yale University School of Medicine, New Haven, Conn.,

E K. Marshall Jr, Johns Hopkins University School of Medicine, Baltimore,

Francis G Blake, Yale University School of Medicine, New Haven, Conn.,

Perrin H Long, Johns Hopkins University School of Medicine, Baltimore,

W Barry Wood Jr, 600 South Kingshighway, St. Louis

SATURDAY, MAY 4, 1946

## ORAL BASAL TEMPERATURES AND OVULATION

Van de Velde's observation as to the existence of variations in body temperature during phases of the menstrual cycle has been confirmed by a number of observers[1] Rubenstein correlated his study of vaginal smears with a study of basal temperatures, he found that during the phase of follicle development the basal rectal temperature tends to drop progressively The low point in the temperature is reached when the follicle matures The diphasic character of the menstrual cycle in normal women was confirmed by a number of observers, among them Palmer," who believes that rises and falls in the body temperatures of normal menstruating women are brought about in some way by the activity of the two types of hormones, estrogens and progestogens elaborated by the ovary Palmer states that diagnosis of pregnancy may be made from a patient's basal body temperature as early as it can be made from other signs, symptoms or tests, if not earlier Sterility apparently due to improper timing of coitus may be overcome if use is made of the basal body temperature record

Tompkins[3] advocated a wider clinical application of the method of detection of the date of ovulation through basal temperature graphs He likewise points out that the temperature is relatively low during the first part of the month, drops to a minimum about the time at which ovulation occurs and rises definitely thereafter to a relatively high level, which is maintained until the next menses, when the temperature drops abruptly Such temperature fluctuations are not found before the menarche, after the menopause or in men If conception occurs, the temperature will remain at the high postovulation level Tompkins has developed a special form printed on grid paper for the recording of daily basal temperatures He believes that with the aid of these graphs it will be possible frequently to indicate the date of ovulation

In a study of 500 patients whose basal temperature graphs have been collected during the past two years, Davis[4] reemphasized recently in The Journal the value of basal temperatures in the clinical interpretation of ovarian physiology Davis urges the substitution of oral temperatures for the record of rectal and vaginal temperatures in use now These temperature observations have been correlated with a study of vaginal smears, endometrial biopsies and operative material Basal temperatures were found to be reliable indexes of ovarian activity in at least 3 out of 4 women In the remaining 1 the curve is so atypical that no accurate interpretation of physiologic changes can be made The temperature drops twenty-four to thirty-six hours before the onset of bleeding, reaching a low level during the first day or two after the onset of the menses Davis believes that the rise in the temperature is brought about by ovulation and that the elevated basal temperatures are maintained by the corpus luteum activity Persistence of the elevated temperature during pregnancy would add weight to this interpretation When pregnancy occurs the basal temperature remains at the postovulatory level during the first few months of the gestation Davis feels that a basal temperature curve should be a part of every study of sterility This is the simplest technic for ascertaining ovarian activity and dating ovulation The persistence of the postovulatory elevated temperature in the event of conception constitutes the most accurate early data concerning pregnancy Temperature curves can be used as contraceptive aids

## THE AMERICAN ACADEMY OF PEDIATRICS STUDY OF CHILD HEALTH SERVICES

Under the auspices of the American Academy of Pediatrics a study of child health services is now being conducted throughout the United States This study is being made under the control of physicians The Academy of Pediatrics has contributed substantial sums from its reserve funds and has obtained contributions from other sources to finance its work The U S Public Health Service and the Children's Bureau are supporting this survey with assigned personnel to assist in the accumulation and statistical analysis of the data A considerable grant was also made for a two year period by the National Foundation for Infantile Paralysis because of the special interest of that foundation in diseases affecting children their hospitalization and their medical care

The study arose from a belief of the American Academy of Pediatrics that we must have scientific planning to meet the needs of children in the postwar

period and that the responsibility for such planning rests on physicians themselves The study includes services of hospital facilities, community health services, distribution, qualification and activities of professional personnel and pediatric education The survey will supply a collection of factual data to be used as the basis for recommendations leading to a long term program for the medical and health care of the child Since those who are making the study will depend largely on the medical profession and particularly on pediatricians for the assembling of data and for opinions as to the quality of medical services available, THE JOURNAL would urge every physician who can render aid in this project to do everything possible to facilitate the accumulation of data No similar study of health services for children has ever been conducted on a national level Preliminary tests were made in North Carolina which led to the development of the forms by which data will be assembled

At the completion of the study a factual report will be prepared and made available to all who may be concerned with planning in the field of child care Thus it will concern particularly legislative programs both on a national and on a state level In several states activities are already well under way toward completion of the project A manual for state chairmen and executive secretaries has been developed and a considerable staff is devoting full time to this work The office of the survey is 7950 Rockville Pike (Bethesda Station), Washington 14 D C The director is Dr John P Hubbard, formerly a member of the staff of the Children s Hospital in Boston

## FACTORS OF SAFETY IN THE HUMAN BODY

In engineering the term "factors of safety" means the margin required in the building of engines or bridges to cover any contingency that may arise in the form of unusual stress or strain The term was introduced into medical literature by the late Samuel J Meltzer He suggested the doctrine that the human body is constructed with special consideration for the greatest degree of safety rather than for the greatest economy Circumstances may develop, however, in which factors of safety are resolved into elements of peril by processes so subtle that the body is warned of danger only when restitution is impossible For example, one kidney may be removed with impunity if the other is normal and the amount and composition of the urine under the changed regimen remain practically unaltered This means, of course, that the kidney has an amount of excess tissue which is sufficient on short notice to take on at least twice the total of work to which the organ is ordinarily accustomed In addition, experiment reveals that at least two thirds of the available kidney tissue in the body may be removed without detriment to function In both instances it is the remaining glomerulus with its tubular extension which constitutes the factor of safety In the compensating kidney the glomeruli enlarge, sometimes in such manner as to stretch their limiting membranes, and the tubules increase in caliber The glomerulus is then in a position to receive a larger supply of blood, and the tubule is prepared to accommodate reasonable increase in the output of fluid In certain conditions of disease the glomeruli by thousands are partially or completely replaced by overgrowth of the epithelium of Bowman's capsule or by fibrous tissue or by amyloid deposits Many of the remaining glomeruli enlarge and, within limits, compensate for those which have been injured or destroyed Beyond these limits compensation fails and the patient begins to show signs of renal disturbances, indicating that anatomic factors of safety have been disposed of in numbers sufficient to damage the organ irreparably—insidiously and without warning, factors of safety have been converted into elements of peril

Factors of safety are present in the heart, both in the endocardium and in the muscle tissue The valves, notably the aortic and pulmonary cusps, are provided with an amount of tissue which is more than that needed at any one time On the aortic and pulmonary valves above the lines of closure are semilunar sheets of endocardium which are almost precisely the same size as that of the valvular endocardium below the lines of closure, so that the valves contain about twice as much tissue as is needed to prevent leakage When certain disease processes attack the valves along and below the lines of closure, causing retraction the endocardium above the lines of closure is automatically drawn down to take the place of the retracted part This mechanism makes it possible for heart valves thus fortified to undergo extensive sclerotic changes and still remain functionally intact However, a time comes when the process of retraction assumes the ascendancy and at that moment the valve becomes incompetent Similarly, anatomic factors of safety are inherent in the heart muscle, lungs, liver, pancreas adrenal capsules, skin and elsewhere

In the human body certain cells are set apart for purposes of regeneration necessitated by natural attrition, especially those of the lowermost layer of the skin, the germinal follicles in the lymph nodes and the hemopoietic bone marrow As long as growth control is under proper restraint, these cells reproduce and differentiate, function and are discarded But the process of reproduction is a potential menace because cells are often manufactured in excess of those needed to meet physiologic requisites In certain tissues not only is the supply of new cells excessive but the new cells, at least according to one view, assume a type of architecture in which equilibrium between structure and function is unstable and growth may progress beyond control, a tumor resulting In this way, again, factors of safety are converted into elements of danger

# Current Comment

## DISTRIBUTION OF STREPTOMYCIN

Elsewhere in this issue (page 31) appears an official statement concerning streptomycin, prepared by Dr Chester S Keefer chairman of the Committee on Chemotherapeutics and Other Agents of the National Research Council As pointed out by Dr Keefer, introduction of streptomycin is so recent that much still has to be learned of the limitations, usefulness, methods of administration, dosage toxicity and other aspects of the therapeutic use of this antibiotic Supplies are restricted, so that distribution of what is available must be carried out with the object of accumulating important information in the most efficient manner possible Dr Keefer points out that many requests for the drug will have to be denied because patients selected to receive it must be those most likely to benefit Physicians realize that in the circumstances a technic for the most equitable usage of the available supplies of streptomycin had to be established and will continue to be patient until the supplies are more adequate and the therapeutic indications are more clearly elucidated

## PHYSIATRIST

Now that the term "physical medicine" has replaced the designation physical therapy and has been generally accepted throughout the United States, a one word term is needed to designate the physician who specializes in this field There now exist the Council on Physical Medicine of the American Medical Association the American Congress of Physical Medicine and the Society of Physical Medicine The Council now publishes a "Handbook of Physical Medicine" and the Congress publishes the *Archives of Physical Medicine* There has been a tendency to speak of technical workers in this field as physiotherapists or physical therapists For more than two years a representative group from the membership of the American Congress of Physical Medicine has been discussing a suitable designation for the physician who specializes in physical medicine Three such designations have been proposed, and all sound strange when first used The three terms which have been suggested are (1) "physiatrist," (2) "physiatrician" and (3) "physicologist" Among all groups of physicians who have discussed these terms a distinct preference has been expressed for the designation 'physiatrist" While this term may sound peculiar to the unmitiated ear the terms "psychiatrist," 'physicist," "internist" and "orthopedist" probably sounded equally queer when they were first proposed The term "physiatrics" already appears in standard dictionaries as an acceptable word The designation "physiatrist" is etymologically correct and stems from pure Greek origins It derives from the two Greek words 'physis" and "iatreia" "Physis" pertains to physical phenomena or natural phenomena and the terms "physicist" and "physiologist" derive their first syllables from the same origin "Iatreia" refers to healing or healer or physician so that a physiatrist would be a physician who employs physical agents At its last annual meeting the Council on Physical Medicine voted to sponsor the term "physiatrist" as the designation for the physician specializing in physical medicine Now that fellowships or residencies in physical medicine are being offered at such institutions as the University of Pennsylvania, University of Minnesota, Harvard University, New York University Ohio State University and University of Kansas and at many other medical centers, a one word term should designate physicians who complete such fellowships

## OFFICIAL STATEMENT ON PENICILLIN IN SYPHILIS

The following statement, for release to the press, was prepared jointly on April 22 by Dr J R Heller Jr, director of the U S Public Health Service, and Dr J E Moore, chairman, Syphilis Study Section, National Institute of Health, and was approved by Dr A N Richards, Committee on Medical Research, Dr R E Dyer and Dr Thomas Parran, U S Public Health Service, and Dr R P Herwick, Food and Drug Administration The statement was released to all leading press services

The Syphilis Study Section of the National Institute of Health, U S Public Health Service, became aware some months ago of the fact that penicillin as commercially prepared contained not one but several penicillins, known as G, X, F and K. Penicillin K has been shown to be of little or no value in syphilis and in certain other infections because, as compared with other penicillins, it is rapidly destroyed in the body The relative effectiveness of the other penicillins G, X and F, has not yet been determined for syphilis or for other infections

As commercially supplied during recent months the penicillin of some manufacturers but not of all, has contained substantial though not preponderant amounts of penicillin K. The proportions of K have not been enough to reduce seriously the value of the drug in the treatment of syphilis or in any other infections and there is no occasion for alarm on the part of physicians who have used it or of patients who have been treated with it. As currently available and employed, penicillin is the best and safest method of treatment of syphilis yet devised. Any patient frightened by newspaper publicity has only to consult his physician or clinic for his usual recheck examination in order to determine his present status

The situation as to penicillin is a complicated scientific problem under cooperative study both in laboratories and in clinics working under the sponsorship of the National Institute of Health and by industry Industry has already taken immediate steps to reduce the K content of commercial penicillin and will rapidly apply further scientific information as it becomes available The public will likewise be informed of important developments as they occur

The statement was necessitated by the fact that a writer named Albert Deutsch in a paper called *PM* published a grossly inaccurate and irresponsible statement on the subject before the official scientific report directed to the medical profession could be prepared and released The source of Deutsch's information is unknown, but presumably some one who participated in the official conference violated his agreement to abide by the official release of the facts

# MEDICINE AND THE WAR

## ARMY

### PROFESSIONAL CONSULTANTS

In order to insure the maintenance of the highest professional standards and to provide close liaison with leaders in the medical profession at large a system of utilizing professional consultants developed by the Surgeon General during World War II will be continued and extended in the future Professional consultants who are recognized experts in the medical and allied specialties including internal medicine, surgery, neuropsychiatry, preventive medicine, dentistry, veterinary medicine and other special medical fields, will be designated by the Surgeon General, according to War Department Circular 101 dated April 4, 1946

Recommendations for appointments in connection with special subjects such as dentistry and veterinary medicine will be made by the senior officer in these fields They may be either appropriate officers commissioned in the military service (Regular Army Army of the United States Officers Reserve Corps or National Guard of the United States) or qualified civilians selected to render consultant service Although the provisions of this circular apply particularly to the United States overseas commanders will utilize appropriate medical officers in their commands for similar duties or may procure professional advice from locally available civilian medical experts

Qualified persons, designated by the Surgeon General will be utilized as medical consultants in one of two capacities—that is either by being ordered to active duty as officers commissioned in the Officers' Reserve Corps or the National Guard of the United States in accordance with War Department policy or by being employed as consultant holding accepted civilian appointments under the authority of the Secretary of War The consent of the individual concerned will be obtained prior to placing him on duty The Surgeon General will maintain up to date lists and from time to time inform all concerned of the names address and qualifications of medical experts selected and approved for consultant duty He will also furnish details regarding the procedures for placing consultants on duty These instructions are equally applicable to dental and to veterinary consultants

### AWARDED MERITORIOUS SERVICE UNIT PLAQUE

The Meritorious Service Plaque was recently awarded to the Army Institute of Pathology The letter of transmittal from the Surgeon General to the director of the institute, Col J E Ash read, in part Under the provisions of circular 345, War Department, 1944 as amended by section 1 circular 331, 1945, I take great pleasure in awarding the Meritorious Service Plaque to the Army Institute of Pathology, your command, for superior performance of an exceptionally difficult mission and for untiring devotion to duty of the personnel of this unit during the period July 1945 to Dec 31, 1945 '

### ARMY AWARDS AND COMMENDATIONS

#### Colonel Paul F Russell

The Legion of Merit was recently presented to Col Paul F Russell Washington D C, for exceptionally meritorious conduct in the performance of services in Italy from March 14 to Sept 24, 1944 During this time, according to the citation 'Colonel Russell, as chief malariologist, Allied Commission by his efficiency in the performance of his duties and unceasing application to the problems under his jurisdiction, succeeded in eliminating the factors which threatened the addition of an acute malaria epidemic to those other problems with which the Allied Forces in Italy were faced Working under all the disabilities imposed by the chaotic conditions of modern warfare, he organized civilian malaria control bodies and coordinated their work in such a fashion that the menace of malaria, which might well have nullified much of the Allied military efforts in the Italian campaigns, was successfully coped with in all occupied territory and in the combat areas Apart from the value to actual military operations, Colonel Russell's work ranks among the highest accomplishments of the Allied Forces in Italy"

Colonel Russell also received the Oak Leaf Cluster to the Legion of Merit, which was accompanied by a citation stating that while he was serving as chief of the Tropical Disease Control Section, Preventive Medicine Service, Office of the Surgeon General, from May 23, 1942 to Sept 9 1943, he 'rendered services of inestimable value in the Army's program for the control of insect borne diseases Skilfully utilizing his wide experience in malariology, Colonel Russell developed a program for the control of malaria in overseas theaters where this disease has become one of the Army's foremost medical problems of World War II He initiated the establishment of malaria survey and control detachments within the Medical Department, planned tables of organization and equipment and formulated policies for their employment in the field The effective functioning of these control units was a decisive factor in reducing malaria rates to a point where they were no longer a significant influence on military operations Colonel Russell's meritorious achievements were a highly effective contribution to the war effort, and his services were rendered with an unselfish devotion to our armed forces"

Dr Russell graduated from Cornell University School of Medicine in 1921 and entered the service May 20, 1942

#### Major John M Usow

The Bronze Star Medal was recently awarded to Major John M Usow Milwaukee, "for meritorious achievement in connection with military operations in the Mediterranean Theater from Dec 1 1942 to May 8, 1945 As one of the pioneer neuropsychiatrists in the Mediterranean Theater of Operations, Major Usow personally treated a majority of the psychiatric casualties evacuated from the Tunisian front, most of whom were returned to useful duty in the theater, and in addition was responsible for the establishment of the first medical board for the disposition of such patients By his great energy and superior professional ability Major Usow was responsible personally for the return to duty in the theater of hundreds of psychiatric casualties and contributed in a large measure to the formulation of standards, policies and methods resulting in the return to duty of thousands of other such patients By his actions and by his devotion to duty he played a leading role in conserving the strength of the command and has reflected credit on himself and the Medical Corps of the Army of the United States Dr Usow graduated from Marquette University School of Medicine, Milwaukee in 1934 and entered the service Aug 30 1942

#### Major Max C Igloe

The Bronze Star was recently presented to Major Max C Igloe, DeRidder La., 'for meritorious service in connection with military operations against an enemy of the United States during the period Aug 1, 1944 to May 8 1945 Major Igloe, serving as chief of the Public Health Subsection G 5 Section, Headquarters Third U S Army, distinguished himself by his outstanding performance of duty The professional skill and resourcefulness he displayed, his loyal untiring devotion to duty reflect great credit on himself and the military service" Dr Igloe graduated from the University of Illinois College of Medicine, Chicago, in 1927 and entered the service Aug 28, 1942

# PHYSICIANS SEPARATED FROM SERVICE

## ARMY MEDICAL CORPS OFFICERS RECOMMENDED FOR/OR RELIEVED FROM ACTIVE DUTY

### Alabama

Bishop, Brooks H., Capt., 7800 1st Ave. S., Birmingham
Caldwell, Samuel W., Major, 4315 10th Ave. Wylam
French, James H. 1st Lt., N. Main St. Brundidge.
Gray, Frederick J. Jr., 1st Lt. 82 Village, Sheffield.
Hamrick, R. A. Major, 1325 W. 45th St., Belview, Birmingham
Moore, Joseph W., Major Clanton
Partridge, Clarence V. Major, 17 S. Monterey St., Mobile.
Perley, Abraham I., Major State Board of Health, Lafayette
Peterson, Carl M., Capt., Box 442, Opelika
Simpson, Sam P., Capt., 4 Dwight Sq., Alabama City

### Connecticut

Bakunin, Maurice I., Capt. 105 Brooklawn Ave., Bridgeport.
Birnbaum, Hyman B., 1st Lt., Madison
Erskine, Louis A., Capt., 789 Howard Ave., New Haven
Horn, Benjamin, Major, 620 Clinton Ave., Bridgeport
Pious, Lawrence K., 1st Lt., 756 George St., New Haven.
Reidy, Maurice J. Jr., Capt., 43 Walnut St. Winsted.
Sayers, John J., Capt., 33 Mountford St., Hartford
Serena, J. M., 1st Lt., Cor. Garner St. & Oakfield Dr., Norwalk.

### District of Columbia

Barrett, Robert J. Jr., Capt., 14 Grant Circle N.W., Washington.
Gannon, J. A. Jr., Capt. 1915 Biltmore St. N.W., Washington
Gordon, Everett J., Capt. 321 N. St. N.W., Washington
Heilman, Charles, Capt. 5501 1st St. N.W., Washington
Henkin, Allen E., Capt. 3553 Georgia Ave. N.W., Washington
MacAtee, G. J., Capt., 2205 California St. N.W., Washington
Scott, James M., Capt., 3834 McKinley St. N.W., Washington

Brewer, Frederic W. Major, Box 687, Sulphur
Fischman, Jacob L., 1st Lt. 3021 Magazine St., New Orleans
Fourrier, Daniel J., Col. 939 Laurel St., Baton Rouge.
Murdock, Lloyd H., Capt., Zwolle

### Maine

Curtis, John B., Capt., Milo
Fisher, Samson, Capt., 293 Pleasant St., Oakland
McLaughlin, Ivan E. Capt., 53 Dresden Ave., Gardiner
Nickerson, Norman H. Lt. Col. Greenville.
Rich, David Capt., 165 Essex St., Bangor
Rosen, Abraham E., Lt. Col. 438 Hammond St. Bangor
Simecek, Victor H., Capt. 179 Main St., Brunswick.
Spencer, Jack Col., 339 Danforth St., Portland.

### Oklahoma

Bilger, Earl E., Capt., Claremore
Haddock, John P., 1st Lt. 231 E. Gray, Norman
Miles, Walter H., Lt. Col., 1221 N.E. 14th St., Oklahoma City
Morey, John B., Major 1314 S. Johnson, Ada.
Newell, Waldo B. Jr. Capt., 2600 E. Willow, Enid
Pigford, Charles A., Col. 1202 E. 14th Pl., Tulsa.
Smith, Charles A., Major, 406 N.W. 22d, Oklahoma

### Tennessee

Chamberlin, Arlie H. Jr., Capt., 1450 Peabody Ave., Memphis
Gessler, Ivan W., Capt., McMinnville.
Hall, James T., Lt. Col., 648 Chelsen Ave. Memphis
Hall, Vonnie A., Capt., 951 Sheridan St., Memphis
Harris, Leo C. Jr., Capt., 860 Madison Ave., Memphis
Hurt, William E., Capt., Halls
Kuykendall, Nathaniel W. Jr., Capt., 1265 Union Ave., Memphis
Manson, Tim J., Capt., 417 Sunset Rd., Lookout Mountain.
Maxwell, John W., Capt., 1508 Hawkins St., Nashville.
Morris, Al K., Major, Fork Mountain
Myron, Harry Jr., 1st Lt., Johnson City
Pentecost, Ben L., Lt. Col. 974 N. Parkway, Memphis
Saffold, John H., Capt., 1206 N. Broadway, Knoxville.
Shaw, John L., Major, 38 N. Belvedere St., Memphis

### Utah

Bourne, John R., Capt., Roosevelt
Clark, James K. Capt., 376 N. 4th E., Provo
Coletti, Anthony E., Major, Box 145, RFD 1, Clearfield.
Nelson, Walfred A., Major, 1309 Michigan Ave., Salt Lake City

### Vermont

Harris, Max, Capt., 90 Lincoln Ave., St. Albans
Mills, Ernest L., Capt., 339 Colchester Ave., Burlington
Monti, Lyle J., Capt., 15 Humbert St., Barre

### Virginia

Barton, Harry Jacobs Jr., Capt., 1301-21 Franklin Rd., Roanoke.
Buxton, Ernest P. Jr., Major, 707 Med. Arts Bldg., Richmond
Byrd, Charles W., 1st Lt., Louisa
Craddock, George B., Capt., 913 Allied Arts Bldg., Lynchburg
Foust, Glenn T. Jr., Capt. 310 Park Pl. Charlottesville
Goslmer, B. J. Capt., RFD 1, Chesapeake Beach, Lynnhaven.
Harman, William E., Capt., Floyd

### Washington

Beaver, Nathaniel E., Capt., 1125 S. Division, Walla Walla.
Broz, William R., Capt., 915 37th Ave., Seattle.
Congdon, Russell S., Capt., Red Apple Rd., Route 1, Wenatchee.
Epton, Josh W. Lt. Col., 1 Walnut Rd., Opportunity
Fitzmaurice, Bertrand T., Capt., 4201 55th Ave. N.E., Seattle.
Harmon, Merle S., Lt. Col., 214 W. Beacon, Montesano
Harrington, Bernard D., Lt. Col., 315 S. K St., Tacoma
Jones, Scott S., Lt. Col., 2208 N. Cedar St., Tacoma.
Knudson, Wendell C., Capt., 1627 Calhoun St., Seattle.
McFee, John L. Capt., 3704 S. Yakima Ave., Tacoma
Noonan, Clayton T., Major, 5810 Cowan Pl., Seattle
Parrott, Robert M., Capt., Rt. 7, Box 947, Tacoma

### West Virginia

Baldock, Harry E., Capt., 1217 Edgewood Dr. Charleston
Crews, Howard R., Capt., 1001 12th St., Huntington.
Gaynor, John S., Capt., Peters Run Rd., Elm Grove.
Given, Arnold J., Capt., Rensford
McCuskey, Paul L., Capt. 903½ McColloch St., Wheeling
Nutter, Raymond B. Jr., Capt., Lumberport
Peters, Joseph T. Capt., 436 Forest Ave., South Charleston
Polen, Frederic E., Capt., 3421 Main St., Holliday's Cove.

### Wisconsin

Bentley, John E., Lt. Col., Wisconsin Gen. Hosp., Madison
Birk, Benjamin J., Col., Route 2, Thiensville.
Boner, Albert J., Major, 15 W. Main St., Madison
Boren, John W. Jr. Capt. 363 State St. Marinette

# ORGANIZATION SECTION

## National Health Program

### PLATFORM ADOPTED BY THE AMERICAN MEDICAL ASSOCIATION

*One of the ten points in this platform will be published each week*

4 The child should have throughout infancy proper attention, including scientific nutrition, immunization against preventable disease and other services included in infant welfare Such services are best supplied by personal contact between the mother and the individual physician but may be provided through child care and infant welfare stations administered under local auspices with support by tax funds whenever the need can be shown.

## Medical Economics

### GEORGIA MEDICAL SOCIETY ACTS ON WAGNER-MURRAY-DINGELL BILL

(NOTE—Following is the official action of the Georgia Medical Society taken March 16 on the Wagner Murray-Dingell Bill )

It is the consensus of opinion of the members of the Georgia Medical Society that socialization or any other form of regimentation of medical services, administered from the national level, is expensive, wasteful and time consuming, ill suited to the care of the sick in general and the medical emergency in particular Such a program could not be administered in a democratic manner pleasing to either the patient or the physician

The quality of service to the patient would be strained and inferior in the beginning and would deteriorate rapidly Medical research would be curtailed, medical education would be static and medical progress in general would be set back two years for every single year such a program was in effect That has been the experience in those countries where regimentation of medical services has been tried

The plan of Senators Wagner and Murray and Congressman Dingell is socialization of the most vicious sort and must be defeated. Their original bills were referred to the Senate Finance Committee and the House Ways and Means Committee. They have not been reported out but after President Truman's message to Congress on Nov 19, 1945 Senators Wagner and Murray introduced a new bill S 1606 in the Senate and Congressman John Dingell introduced an identical bill, H R. 4730 in the House of Representatives These bills were shorn of some of the financial provisions, making it possible to refer them to committees more sympathetic For example S 1606 was referred to the Committee on Education and Labor, of which committee Senator Murray is chairman. These bills will undoubtedly be reported out of committee and probably at an early date. When reported out, they will have the very strong support of the C I O and other well organized groups, which may make their defeat most difficult We are informed that the Y W C A in national session at Atlantic City two weeks ago went on record as favoring such legislation

The Georgia Medical Society is gravely concerned about such trends and unalterably opposed to such legislation. Several months ago a committee was appointed to meet with similar committees from the dentists lawyers, pharmacists, retail credit men, realtors medical auxiliary, pharmacists auxiliary nurses and others to seek ways and means of opposing socialistic trends in national government and to seek ways and means of curing those ills which foster such trends

We have met with enthusiastic cooperation from the other groups and have learned much and accomplished much in our first few meetings We have organized and solidified our home front and have sent to our Senators and Congressmen more than twelve hundred letters from the citizens of Savannah letting them hear at long last the voice of our stratum of society, a voice too long silent in this country We feel confident that organization of these groups can be accomplished in every county, parish and state of this great nation and the letters of protest pouring by the millions into Washington can save for us that freedom of thought and action for which our ancestors bled and died

JOHN L ELLIOTT, M D Chairman
HOWARD T EXLEY, M D
W V LONG, M D, President.

## Washington Letter

*(From a Special Correspondent)*

April 29, 1946

### Successful Treatment of Gonorrhea with Penicillin

The War Department has announced that 96 per cent of some 11,000 cases of gonorrhea among servicemen treated with penicillin at Fort Meade during the past have been cured without hospitalization The remaining 4 per cent were generally cleared up through combining sulfathiazole with penicillin The War Department stated that the high incidence of venereal disease at Fort Meade was the result of its use as a separation center for overseas veterans and it is the policy of the Army not to discharge any man so afflicted Of 25,968 patients treated for venereal disease, approximately 11,000 received an average of four treatments each, exactly 42,807 in all.

### More Health Education for Public Schools

Dr Hobart M Corning, newly appointed superintendent of District of Columbia public schools, advocates improvement in health education in public schools He told a meeting of teachers that the schools of the country have a tremendous responsibility to build the health of students

### Senate Bill Prohibits Unauthorized Sale of Barbiturates

The Senate has passed and sent to the House a bill to ban, under heavy penalties, the unauthorized sale of barbiturates in the District of Columbia The bill was sponsored by the Federation of Women s Clubs

### Two Way Radio Telephone Service For Doctors and Nurses

A radio engineering concern in Alexandria, Va., established by four war veterans has started a new two way radio telephone service for automobiles operated by doctors and nurses, ambulances and taxicabs

## Official Notes

### "DOCTORS AT HOME" TIME NOT CHANGED

Contrary to the announcement last week the radio time of "Doctors at Home" remains unchanged with the adoption of Daylight Saving Time. This Saturday afternoon program over the NBC network will continue to be heard at 4 to 4 30 p m. Eastern Time, 3 to 3 30 Central Time, 2 to 2 30 Mountain Time and 1 to 1 30 Pacific Time. Wherever Daylight Time is not in operation, the program will be one hour earlier

Following are the programs scheduled for the remainder of the series

| | |
|---|---|
| May 4 | Child behavior |
| May 11 | Mushroom poisoning |
| May 18 | Highway safety |
| May 25 | Trichinosis |
| June 1 | Health education |
| June 8 | Medicine in the future |

These programs will be summarized alternately by Drs W W Bauer and William W Bolton respectively Director and Assistant Director of the Bureau of Health Education.

# THE WAGNER-MURRAY-DINGELL BILL

## Hearings on S 1606—To Provide for a National Health Program

(NOTE.—*This is a condensation of the verbatim report of the hearings*—ED)

*(Continued from page 1750 volume 130)*

United States Senate, Committee on Education and Labor

APRIL 10, 1946

The HONORABLE JAMES E. MURRAY Presiding

PRESENT Senators Murray, Johnston Aiken and Donnell

### Statement of Harold L Ickes, Executive Chairman of the Independent Citizens Committee of the Arts, Sciences and Professions

MR ICKES I am glad to have this opportunity to appear before this distinguished committee today in support of the purposes of the Wagner-Murray-Dingell Bill

*(Mr Ickes told of his interest in conserving our resources and of the inadequacies in health revealed by the Selective Service)*

I am not disposed to believe implicitly in the rigid accuracy of these figures or to infer too much from them I am well aware that the standards of local draft boards varied from county to county and from time to time and that some men who were rejected for physical defects might well have been accepted at a later time or in a different county I also know that there are hundreds perhaps even thousands, of men who, by one device or another simulated an illness of sufficient gravity to warrant rejection by their draft board

I am however conscious that thousands and perhaps tens of thousands, of men with fairly grave physical defects were drafted into the Army when this country reached the end of its manpower resources back in 1944 So it is my belief that while these figures from the Selective Service System may not be strictly accurate they are probably roughly so and to my mind they are indicative of a serious flaw in the system under which in normal times the medical needs of the people of this country are provided for

There are other evidences to support the contention that medical care in this country is not what it should be On the basis of the latest available figures there are seven other countries in the world which have lower infant mortality rates than this one. There are eight or nine which have lower mortality rates for adolescents

The reason for the higher incidence of death among almost all classes in this country than in many others is found in part at least in the tragic figures which show that, even before the war our rural areas were but scantily supplied with doctors and nurses

*(Mr Ickes discussed mortality and morbidity rates)*

I would be the last to deny that the country doctor has produced miracles in his time, but I think that the country doctor who has performed these miracles for years without adequate tools of his profession to help him deserves a better fate than to be consigned forever to caring for his patients through the medium of a bag of pills and a stethoscope

I am no Johnny-come-lately to the cause of more adequate hospital facilities for the people of this country When President Roosevelt designated me as public works administrator, I early had impressed on me the woful lack of modern medical facilities in the United States and during my tenure of that office nearly eight hundred projects providing for new hospitals or additions and improvements to existing ones were initiated

All told close to half a billion dollars was spent under my direction for the improvement of the means of taking care of the nation's ill and diseased And this does not include the huge sums nearly a billion dollars which were spent in what might be called the field of preventive medicine, for sewer and water systems for example My only regret is that more of the funds which were spent in those days were not put to use in permanent improvements such as the PWA built rather than in being frittered away on programs of doubtful value

*(Mr Ickes discussed at great length the mine workers plan for a health and welfare fund)*

I might add at this point that I am unable to see the wisdom of setting up veterans hospitals throughout the country solely for veterans I think that the medical problems of veterans whether they be maimed or psychotic are no different from the medical problems of the industrial worker who loses an arm or a leg or his mind I cannot see why the treatment should be different I challenge any one to tell me why a munitions worker who lost his legs in an explosion while loading shells during the war should be treated any differently than the soldier who suffered the same injury on the battlefield I am not proposing here that our veterans receive anything less than the best I am not suggesting that they be pushed out of hospitals to make room for civilians What I am advocating is that all of us everywhere in this nation have the benefit of competent medical and hospital facilities Hospitals treat people not veterans or coal miners They treat diseases—tuberculosis, silicosis cancer—not dock workers or musicians

In summary let me say that I believe that there is a real and vital need for more adequate medical care for more of this nation's inhabitants I believe something should be done about this and quickly I do not believe that this job can be done piecemeal or by industry or labor alone I think that the Wagner Murray-Dingell Bill provides what seems to me to be a real opportunity to achieve the end that all of us desire.

SENATOR MURRAY Mr Ickes I note that you have talked mainly of the lack of adequate modern medical care and hospitalization in this country and the need of some plan whereby more modern medical care and hospitalization shall be made available to the people of this country Have you studied the various technical provisions of the bill, and are you prepared to discuss those provisions in regard to the effect that they will have and the manner in which they purport to bring to the American people this modern medical care and hospitalization that we have? MR ICKES I would not be competent to discuss those, Senator but Dr Butler of Harvard Medical School is here, and I understand that he will follow me as a witness and he has forgotten more than I ever knew about such matters

SENATOR JOHNSTON I notice that you speak critically of the government taking over the medical problems of the veterans You say that they have no more right to go into that field than they do for the medical problems of the industrial workers Do you not think service connected disability is quite different from probably some one working for a private industry? MR ICKES The veterans, of course ought to have all the medical help and attention that they need, but civilians also ought to have it

SENATOR JOHNSTON You make the statement "I think that the medical problems of veterans, whether they be maimed or psychotic, are no different from the medical problems of the industrial worker who loses an arm or a leg or is maimed ' You say, in a sense, that a man that is wounded on the battlefield is no different from a man that is injured in industry MR. ICKES I said no such thing, and I am not going to be drawn into a demagogic discussion

SENATOR JOHNSTON That is what you say If anybody gets demagogic, I think from past records and history it might be the past and the ex-secretary of the interior

MR. ICKES What about a man digging coal in order to carry on the war? If you want to go down that alley, it has many ramifications SENATOR JOHNSTON Your ideas are absolutely socialistic to take over everything is that true? MR. ICKES Far from it

SENATOR JOHNSTON Where are you going to stop? MR ICKES Well, I do not have to say where I am going to stop I am saying where we ought to go

SENATOR JOHNSTON I will be the one to pass on the legislation and pass it and I want you to tell me where to stop Where would you stop? MR. ICKES The statement takes care of that

SENATOR JOHNSTON You leave it entirely up to us, but you do not say anything the way your statement is it is only general MR ICKES It is general

SENATOR JOHNSTON But you are willing to go all the way, are you not? What are you going to do with the doctors throughout the United States? MR ICKES I think people are entitled to more medical and hospitalization services than they are getting

SENATOR JOHNSTON Are you going to take over all the doctors in the United States? MR ICKES I would not propose that at all

SENATOR AIKEN I take it that you object to the 10 cent assessment on coal because that 10 cents would be added to the price of coal, and it would constitute a tax on all the people of the United States who use coal for the benefit of a single occupational group of around 500 000 men? MR ICKES It is the wrong approach and it is giving the power of taxation to a nongovernmental group

SENATOR AIKEN And if that was carried far enough you would find all union labor would be given the benefits of hospitalization and medical care whereas the majority of the people workmen who do not belong to unions would be left on the outside? MR ICKES That is right

SENATOR DONNELL Mr Ickes I observe as you emphasized that you have carefully refrained from commenting on the specific provisions of this bill S 1606 MR ICKES Yes

SENATOR DONNELL I will ask you to state whether you have read this bill 1606? MR ICKES Well I was prepared for that question because I understand that is a customary question from the Senator I have not I have read a carefully prepared digest of it and I did not know I have been appearing before Congressional committees for some thirteen years and I did not know that it was a necessary prerequisite to have read carefully a bill because I have appeared before so many committees the members of which had not read the bill

SENATOR MURRAY I believe at the commencement of these hearings it was stated that several Senators had not read the bill

SENATOR DONNELL Referring now to my question you have not read the bill is that correct? MR ICKES That is correct.

SENATOR DONNELL Have you read any part of it? MR ICKES Yes sir

SENATOR DONNELL Which part of S 1606 have you read? MR. ICKES Oh well I read the parts that I wanted to read

SENATOR DONNELL Which was that part? MR. ICKES I am not prepared to say

SENATOR DONNELL How recently have you read this bill or the part of it? MR. ICKES During the last two or three days

SENATOR DONNELL And you are still not prepared to say what parts of it you have read is that right? MR ICKES I think it would be by way of supererogation and I do not think that the question is pertinent if I may say so and I do not think that any good would result from my entering into a detailed statement of what I have read or even if I should read any of the record, to cumber up those parts which I have read

SENATOR DONNELL The point that I am making is that you have not read all of the bill MR ICKES I said that

SENATOR DONNELL And you are at this time unable to state to us what part you have read? MR ICKES I have said that two or three times

SENATOR DONNELL I would like to ask you to answer it again You have not read all of this bill and you are unable to state what parts of the bill you have read is that right? MR ICKES For the third time, no and for the fourth time in anticipation no

SENATOR DONNELL Well make it the fiftieth time and say no again. MR ICKES That is right

SENATOR DONNELL Now Mr Ickes you are described here at the outset as being the executive chairman of the Independent Citizens Committee of the Arts Sciences and Professions MR. ICKES That is correct

SENATOR DONNELL Would you tell us please, what is that committee and what is its composition and membership?

(*Mr Ickes listed the officers of the committee*)

SENATOR DONNELL How large a membership does the committee have? MR. ICKES Ten or twelve thousand

SENATOR DONNELL Are you appearing here on behalf of the committee or as an individual this morning? MR ICKES On behalf of the committee

SENATOR DONNELL Has the committee been polled in any way, Mr Ickes with respect to this bill, S 1606? MR. ICKES I can even answer that question

SENATOR DONNELL Will you tell us please about the poll? MR ICKES The national membership meeting on February 10 at the Alvin Theater in New York

SENATOR DONNELL That is, S 1606 was endorsed? MR ICKES That is correct

SENATOR DONNELL Do you have a copy there of the resolution or endorsement? MR ICKES No It has also been endorsed by the national board of directors and the board of directors of each chapter

SENATOR DONNELL How large a meeting was there in New York when this endorsement was made? MR ICKES I was not there I do not know

SENATOR DONNELL Now Mr Ickes you state also in your statement that no one would take exception to the method of paying for old age pensions which the federal government has provided Now as regards old age pensions is it not a fact that the method which the United States government has provided is one under which the states through contributions made both by the national government and by the state governments administer the distribution of those old age pensions that is correct is it not? MR ICKES I do not know What I had in mind was that this plan would be a contribution a deduction from the pay of the employee a contribution by the employer and that administration would be under a board an advisory council the head of which would be the Surgeon General of the United States

(*Senator Donnell by his questions revealed a lack of knowledge by Mr Ickes of current activities in the field of medical care*)

SENATOR DONNELL Now you also mentioned Mr Ickes in the course of your discussion the fact that hospital facilities are not adequately provided in some sections of the country and you refer to that in general terms MR ICKES That is right

SENATOR DONNELL Are you familiar with the bill recently passed by Congress having to do with this hospital problem MR ICKES No

SENATOR DONNELL You do not know how adequately if at all that bill provides for the solution of that problem MR ICKES No but my guess would be that it would not be adequate

SENATOR DONNELL But have you examined that bill? MR ICKES No

SENATOR DONNELL Then you are proceeding merely on your impression as to what that bill probably is is that right? MR ICKES No I am not taking that bill into account at all

SENATOR DONNELL You are not taking it into account at all You do know that such a bill was passed? MR ICKES I know the general situation which I became familiar with as public works administrator during which among other things we built some beautiful hospitals in St. Louis and other places in Missouri

SENATOR DONNELL You have not however studied the provisions of the hospital bill recently enacted by Congress just a few weeks ago? MR. ICKES That is right

SENATOR AIKEN You did state Mr Ickes somewhere in your testimony that construction of the hospital would not suffice unless there was some means of maintaining the operations of the hospital which is not provided for in the hospital bill MR ICKES I would expect that there would be a few flaws in it.

SENATOR MURRAY Thank you for your statement Mr Ickes MR. ICKES You are quite welcome and it is a great pleasure I would like to make one observation that I do not see why the personnel of an organization should be a matter of major interest and I do not see what bearing it has on the merits of the pending legislation

SENATOR JOHNSTON I think that is where the committee disagrees with you and I think that I do, and I think who you represent amounts to a great deal and I think the public believes that. MR. ICKES I am afraid that you have a suspicious mind.

SENATOR JOHNSTON I probably do have a suspicious mind of you MR. ICKES Now that does flatter me

SENATOR DONNELL Of course, we are here undertaking to pass on a specific bill, that is what has been presented to this committee, Mr Ickes Now may I ask you one or two further questions about this committee on behalf of which you speak here this morning? You were not present at the New York

meeting, you say, which approved S 1606? MR. ICKES That is correct.

SENATOR DONNELL Have you ever seen the copy of the resolution that was adopted at that meeting? MR ICKES No

*(Mr Ickes was questioned as to the number of members of the Independent Committee that expressed their view)*

SENATOR DONNELL Now, Mr Ickes, do you know whether or not the fact that S 1606 was to be discussed at that meeting was included in the notice of the meeting which was sent and whether or not the membership of this committee, some eleven or twelve thousand have ever received a copy of S 1606 from which to study its terms? MR. ICKES No, but I must, if I may, or I may if I must, to put it the other way express my admiration for the clean bill of health and the impeccable state of mind with which anybody apparently must approach a bill these days I do not suppose this was any immaculate conception, Senator It was a group of members that discussed, maybe inherently as one votes a straight ticket in an election booth approval or disapproval of a certain measure. It is a democratic process, democratically carried on and not subject to question, Senator, as to methods

SENATOR DONNELL Mr Ickes, if I may be pardoned, I am not at all questioning the right of that committee to pass on the matter and we welcome its views, but I do think that we have a perfect right to inquire into the degree of care which that committee and its officers, including yourself have taken for the study with respect to the study both of the principles and of the bill MR. ICKES I was not an officer at the time

SENATOR DONNELL When were you made an officer of this committee? MR ICKES Five or six weeks ago

SENATOR DONNELL So you are not informed I take it, of what transpired except in a very general way, like any citizen would be in that committee or its deliberations, prior to the time you went in? MR ICKES All that I have given you is hearsay and therefore irrelevant and incompetent.

SENATOR DONNELL I do not think so, I think we are glad to have it and it is helpful to have your views, and I want to respect your views, and I am glad to have them Mr Ickes do you know please, whether or not included in the membership of the Independent Citizens Committee of Arts Sciences and Professions there is any sizable number of physicians, and if so, I would be glad to know approximately what proportion, and perhaps Dr Butler will know DR. BUTLER They are sizable

SENATOR DONNELL The doctor is going to be on the stand and we can find out from him. You are not informed personally? MR ICKES No

SENATOR DONNELL Let me ask you one concluding question, and that is have you ever examined S 1050, namely the bill which was approved as I understand it from Dr Butler, a year or so ago? MR ICKES I have not

**Statement of Dr Allan M Butler, Associate Professor of Pediatrics Harvard Medical School, Chief of the Children's Medical Service, Massachusetts General Hospital, and an Editor of the Journal of Clinical Investigation, Journal of Pediatrics, Quarterly Review of Pediatrics and Advances in Pediatrics**

DR BUTLER Dr Allan M Butler from Boston I am here representing the Independent Citizens Committee, which has just been discussed I am associate professor of pediatrics at the Harvard University Medical School, chief of the children's service, Massachusetts General Hospital, and an editor of five medical journals

*(Dr Butler discussed at some length and with much florid diction the effects of scientific advancement on life)*

I trust that you, in considering this legislation, will accept the fact that the time honored general practitioner who rendered all aspects of medical care to patients is a casualty of the progress of science We must face the fact that the total knowledge available for the care of patients today cannot be mastered by an individual physician Modern medical care of the sick patient requires the services of not one but many physicians, as well as highly trained technical and nursing personnel skilled in the use of complicated apparatus and delicate technics The hospital's role in medicine used to be the provision of bed and operating room facilities Today, provision of these is no more important than the provision of the laboratory procedures and special technics on which proper medical diagnosis and treatment are more and more dependent.

It is a foregone conclusion that some method of adequately financing medical care in an orderly and predictable manner must be evolved Modern science has made medical care extremely costly to the individual patient. Personal experience has proved this too forcefully to probably each of us Yet science has diminished the cost of illness to society by reducing the economic loss incident to death early in life and to unemployment due to illness Obviously, distributing the cost of medical care over society as a whole is a logical solution of the problem created by the present inequitable distribution of the costs of illness

Doctors should not and cannot continue to carry this economic burden No other individuals in a system of free enterprise are asked to make such a contribution The attempt of doctors to do so by soaking the rich is an unsatisfactory and illogical method of meeting the problem As stated by the American Academy of Pediatrics, "the discrepancy that now exists between surgical fees on the one hand and free service to the indigent on the other has contributed in no small part to the problem of an equitable remuneration of physicians" The conclusion is inescapable that the high costs of modern medicine must be financed by people when they are well They cannot be financed by those who suffer the misfortunes of illness

Much is made of the difference between the voluntary or compulsory extension of insurance as a means of distributing medical costs This actually is of minor importance. The important point is that the successful operation of either voluntary or legislative medical insurance on a scale that will be significant in solving the problem of cost will require reorganization of our current medical practice and development of effective administrative agencies at federal, state and local levels

It is imperative that any extension of insurance medicine include adequate provision for teaching and research The bill before you does If adequate provision is not made, then as insured patients cared for by physicians of their own choosing replace the charity hospital patients now cared for by the specially trained personnel of well organized teaching services the quality of medical education will be jeopardized Because medical education determines what the medicine you get tomorrow will be the preservation of teaching and clinical research units is of vital importance to the public The point can hardly be overemphasized

The record of leadership of organized medicine is unbelievably reactionary Indisputable evidence is presented in a paper in the *New England Journal of Medicine*, Feb 21, 1946, which I would like to submit to this committee

SENATOR DONNELL Pardon me, if I may ask for the purposes of identification, would you be kind enough to give us the name of that particular paper? I think there were other papers in that particular issue DR. BUTLER Senator Murray has the only copy I had.

SENATOR DONNELL "Minority Views on Improving Medical Care" It is by yourself DR BUTLER By myself

SENATOR DONNELL Under the heading "Symposium on Medical Sociology" DR. BUTLER Yes These reactionaries, in arguing that attention should be paid to the solution of the general problems of housing, food, unemployment and poverty rather than to improving medical care, are again displaying a lack of responsible leadership in the field that is their business and in which wise direction of effort will bring results beneficial to public and doctors alike Positive action should be taken on the legislation before you at this session of Congress Restriction of this legislation to the provision of certain aspects of medical care to the needy with an inadequate budgetary appropriation may place government medical care in the category of our inadequately financed charity medicine This could be disastrous to American medicine, because it might establish a cheap scale for both hospital and physician remuneration If American medicine is to be good, it will be expensive. It will cost billions Cheap medicine will mean poor medicine, and that, in the long run, will be expensive to the public

SENATOR DONNELL In the first place, he makes a statement on page 2 of the mimeographed copy that is rather startling, at least to a person not a member of the profession of medicine. At the end of the first full paragraph the sentence reads "This record"—and I assume he is referring to the Minnesota record —'reflects the fact that the only standard of practice enforced by state medical societies is the standard that avoids legal malpractice." I would like to ask the doctor, is it not a fact, Doctor, that codes of ethics have been adopted by many state societies and the American Medical Association which go far beyond the mere standard of avoidance of legal malpractice? Am I not correct on that? I may say, that is an assumption

DR BUTLER No no, you are dead right They have so called codes of ethics

SENATOR DONNELL Yes DR BUTLER Those codes of ethics, Senator, are not enforcible in terms of maintaining a quality of medical service, and I used the word "enforced" in the sentence you quoted

SENATOR DONNELL May I ask you also, Doctor, is it or is it not a fact that medical societies are attempting constantly to raise the ideals of the professional ethics among the members? DR BUTLER We must keep two things clear If we are going to talk about professional ethics in terms of standards of medicine we had better define what is included in professional ethics As professional ethics are discussed in most medical societies and attempted to be maintained in most medical societies they have very little to do with the quality of medical services

SENATOR DONNELL Doctor, I am not competent to argue that question with you but it is a fact is it not that the medical societies taken by and large are attempting to see that there is a constant observance of the highest moral principles between physician and patient and the highest conceptions, not merely going back to what as I recall was the old Hippocratic Oath but with modern day developments to insure a high professional standard of ethics between the physician and the patient DR BUTLER They try to insure a pretty good standard of ethics between physician and patient, but again Senator that does not mean they are asserting every effective effort in seeing to it that the doctor renders to that patient a high quality of medical services

SENATOR DONNELL Are there instances in recent years of state medical societies expelling members of the profession for unprofessional conduct? DR. BUTLER Only malpractice

*(Senator Donnell questioned Dr Butler at length about the Citizen's Committee)*

SENATOR DONNELL Doctor, you refer in your statement to the bureaucracy that dominates the opinion expressed by the so-called organized medicine. Do you mean by that bureaucracy an inner circle within organized medicine or do you mean the association as such? DR BUTLER I mean the inner circle.

SENATOR DONNELL The inner circle DR. BUTLER In any organization which is as big as the thing like the American Medical Association and has the huge income of the American Medical Association there unfortunately develops a group whose livelihood depends on continuing to receive the full time relatively large salaries that are paid by the organization for maintaining the administrative end of their show

SENATOR DONNELL And that group is the group to which you refer as the 'bureaucracy'? DR. BUTLER That is right

SENATOR MURRAY Let me ask a question there. What is the official position of Dr Fishbein? DR BUTLER I do not know whether I should mention this because I am not well informed but I have inquired and I have been told that Dr Fishbein's official position in the American Medical Association is editor of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION and I think one or two other journals that are published by that association SENATOR MURRAY He is not actively engaged in practicing medicine? DR. BUTLER He is not actively engaged in practicing medicine, and Senator I would like to take this opportunity to state that unfortunately Dr Fishbein, including a great many of the people who speak concerning medical matters for the American Medical Association have rarely if ever practiced medicine and certainly for years have not been engaged in the practice of medicine

SENATOR DONNELL Doctor do you know approximately the membership of the American Medical Association in number? DR. BUTLER Yes

SENATOR DONNELL What is it? DR BUTLER The American Medical Association never lets you forget. It is about 130 000

*(Senator Donnell questioned Dr Butler as to the composition of the House of Delegates of the A M A)*

SENATOR DONNELL And they are the governing body and the body which presents the expression of the Association which is made during sessions of the House of Delegates That is correct is it not? DR. BUTLER That is right

SENATOR DONNELL The House of Delegates of the American Medical Association has expressed itself has it not with respect to compulsory health insurance? DR. BUTLER That was in the course of the past fifteen years since I have been interested in the improvement of medical care, the American Medical Association has expressed itself on anything that has been suggested to include medical care, and, in retrospect, they have been wrong every time they have expressed an opinion Their record is extraordinary You speak of the Blue Cross and what a wonderful thing it is In 1934 the House of Delegates were against the Blue Cross They have only begun to support it within the last four or five years

SENATOR DONNELL Yes I understand you disagree with that conclusion You may be right, you may be wrong but you are entitled to your opinion Now, Doctor, on the first page you mention one sentence which I do not think has anything to do in particular with this bill except as an analogy You say 'Now, in peace, to prevent the total destruction of ourselves and of our civilization by the latest achievements of science, can we do other than submit to the sovereignty of a world government at the expense of our national independence? DR BUTLER Surely

SENATOR DONNELL Do I understand that you favor the creation of a world government to which there shall be submitted the sovereignty of this nation at the expense of our national independence? DR BUTLER I do not favor that at this moment I think, almost everybody must think, that we have not to look toward that pretty rapidly or, by golly our science is just as likely to destroy us as health is

*(Senator Donnell questioned Dr Butler about the functions and activities of the American Medical Association His answers showed a lack of accurate information—Ed)*

SENATOR JOHNSON Doctor, do you think this bill ought to take care of the osteopaths and chiropractors? DR BUTLER I think the best way to handle that is almost to leave it alone. I as a physician, have refused to pay any attention to the arguments pro and con of osteopaths and chiropractors In a democracy we have to be tolerant. We have to permit people to do what they want to do as long as they do not transgress our laws In doing so we sometimes benefit, we sometimes suffer I just would rather avoid any questions on osteopaths and chiropractors

SENATOR JOHNSON You think they do good do you not? DR BUTLER I would rather not answer that question because to answer it you would have to define when they did good possibly, and when they did harm It is awful hard for somebody to live in this world and not do some good some time

SENATOR JOHNSON The same is true in the medical profession sometimes they do good and sometimes they do harm? DR BUTLER That is right It is all a relative matter

### Statement of Reverend Francis W McPeek, Chairman, Legislative Committee, Council for Social Action, Congregational-Christian Churches

MR MCPEEK Created by action of the General Council is an official organization known as the Council for Social Action of the Congregational-Christian Churches Its eighteen members whose names and occupations are appended are elected by the General Council in its regular sessions Their duty is to make a study of important moral or social questions to determine Christian action in light of the social teachings of our church and to inform member churches of their judgments They are also empowered to represent themselves on these questions in such places and at such times as seem appropriate to them. The Legislative Committee of the C S A of which I have been chairman for several years has been established for the special purposes of advising our fellow church members and other church groups of legislative issues significant to the welfare of the nation I am afraid, Mr Chairman that I have been a bit tedious in explaining these matters, but I do so wish to make it clear that we have no mandate from the denomination as a whole We could not have, short of an action by the General Council

For several years we of the Legislative Committee—and of the Council for Social Action—have held firmly to a conviction that the existing plan of social security should be expanded and implemented I shall not read the various sections of this policy statement but shall mention only the paragraph most relevant to the matter at hand

'4 We hold that sickness and accidents cause social losses which can best be paid by a sound plan of public insurance We believe that health and disability insurance can be provided on a democratic basis with full consideration for the rights of doctors and private hospitals"

Under such a declaration we have published our support to S 1050 in principle—the Wagner-Murray-Dingell bill—and to

S 1606 the National Health Insurance Plan, introduced by the same distinguished members of the Congress In general, we believe that the compulsory health tax plan outlined therein is eminently fair to all citizens, as it is to all physicians Under its several features we believe that America's health gains in the last ten years especially would be conserved and that our present distressing marks of ill health, so incontestably demonstrated by the Selective Service health inventory, would tend to be much more rapidly eliminated

Having made these brief general remarks Mr Chairman, it is now my pleasure to introduce the distinguished physician who will speak on the particulars of the bill A graduate of the Northwestern University School of Medicine, Dr Theodore K Lawless has studied not only at Talladega and the University of Kansas but also in European schools of medicine His residence is in Chicago where he has an extensive practice in his field of specialization dermatology and also syphilology I might further add that Dr Lawless is a member of the American Medical Association and a member of the Council for Social Action of the Congregational-Christian Churches, for which latter organization he appears today

### Statement Made by Dr Theodore K Lawless, Accompanied by Reverend Francis W McPeek

*(After a number of the routine arguments in behalf of compulsory sickness insurance Dr Lawless complained of the difficulty of securing admission of a member of a minority race to St Luke's Hospital in Chicago)*

SENATOR DONNELL Doctor by 'minority group' member, do you mean a member of the Negro race? DR LAWLESS Negroes Mexicans Japanese Chinese

SENATOR DONNELL I meant this particular person DR LAWLESS That is a Negro The next one will be a Japanese A doctor made all arrangements to operate on a patient in a well known hospital yet when she presented herself admission was refused She was a member of a minority group Multiply these cases by 16 million and you have a vivid picture of the plight of these minorities in more than 90 per cent of American hospitals under today's plan for medical care

### Statement of Joseph P Anderson, Executive Secretary, American Association of Social Workers

MR ANDERSON We have approximately 1,000 members in all sections of the country They are employed in both private and public welfare agencies We are organized in ninety six chapters Though our members become members of a national organization they can affiliate in groups in areas where there are a sufficient number for them to do so Our purposes are twofold First of all we are concerned about improving the quality of social work in the same way Dr Butler told you the American Medical Association tries to do We make studies and collect data and publish reports We issue a magazine which goes out to all our members and others who wish to subscribe to it We have been concerned for a long time with medical care and public health service, and in 1941 we first issued a very brief statement in which we stated that it is the responsibility of government together with the medical profession to see that all the people who are in need of medical care and public health service receive that We take such action at the annual delegates conference to which the representatives of our various chapters come, and then by majority vote at that conference we adopt the statement of principles such and such

SENATOR DONNELL When was the most recent conference held? MR ANDERSON The most recent was in the middle of May of 1944 We did not have one in 1945 because there were no conferences being held Our next is going to be held this coming May

SENATOR DONNELL Is there any specific resolution or principle they adopted at that time? MR. ANDERSON Yes At that time the original Wagner-Murray-Dingell bill had not come up for hearings but had been introduced and the action we took was first to endorse in principle S 1050 and also to urge that hearings be started

MR ANDERSON Now, in terms of the statement I do not think I need read that and take the time. It merely states that we support the provisions we believe in S 1606 because we believe in supporting progressive development of public social and health services We believe that health is a basic right of our people in the community We think that at the present time people are not getting these services And then I mention the four factors, which I am sure have been presented before to this committee, as to why the services are not now available and then we mention the principles which we believe any legislation should be based on And I believe that favorable action on this particular bill will represent a courageous and comprehensive attempt to break the old and vicious cycle of poverty begetting sickness and sickness begetting poverty

### Statement of Reverend Jack R McMichael, Executive Secretary, Methodist Federation for Social Service

MR MCMICHAEL The Methodist Federation for Social Service has been in existence since 1907 and is the group out of which grew the original draft of the well known Social Creed of the Methodist Church, which became in substance the Social Creed of the Churches as adopted by the Federal Council of the Churches of Christ in America The organization has the moral blessing and backing of the General Conference of the Methodist Church It seeks to apply the ethical imperatives of the biblical gospel to the social relationships of men and women in our modern world Our organization has long been dedicated to the realization of a program in America which would actually provide adequate medical care for all From the beginning it has given earnest suport to the Wagner-Murray-Dingell bill as a great step in the direction of the ideal of universal and adequate medical care

*(After reciting the same arguments used by other witnesses in behalf of the act in about the same words he continued)*

MR MCMICHAEL Commendable also are provisions calling for maximum participation by local, state and private agencies in the administration of the act and provisions for advisory councils, including representatives of the public as well as of the medical and other professions We ministers welcome this opportunity for qualified clergymen who work intimately with individuals in a community to serve in their behalf on advisory councils We urge that specific representation be given on these important councils to Negro, Jewish and other religious and racial minority groups so as to assure to them an equitable role and share in the administration and benefits of the act We have been gratified by the interest recently shown by organized labor, not only in narrowly conceived trade union problems but in public affairs and in health problems We are confident that representatives of organized labor will also have a great contribution to make on these advisory councils

SENATOR DONNELL Reverend McMichael when was held the most recent general conference of the Methodist Church? MR MCMICHAEL 1944

SENATOR DONNELL Did that conference express itself on the subject of compulsory health insurance? MR. MCMICHAEL No

SENATOR DONNELL Has it ever expressed itself on that subject? MR MCMICHAEL Not that I know of, no It has expressed itself officially on the subject of medical care for all

SENATOR DONNELL But not on the matter of compulsory health insurance is that right? MR MCMICHAEL That is right, as far as I know

---

APRIL 16 1946

The Honorable James E Murray (Chairman), Presiding

PRESENT Senators Murray, Pepper, Ellender, Morse, Donnell and Aiken.

### Statement of William Green President, American Federation of Labor, Accompanied by Nelson H Cruikshank, Director, Social Insurance Activities, American Federation of Labor

MR GREEN Our Committee on Social Security, of which Mr Matthew Woll is chairman has been now for several years engaged in a study of the inadequacies of our present social security program and has, with the assistance of experts in this field drawn up a comprehensive plan for the development of a well rounded national social security system

The program we have developed includes in addition to provisions for extending the facilities needed for health services and provisions for grants to states for public health services and maternal and child health and welfare services and for public assistance, proposals for the establishment of a national social insurance system This covers temporary and extended disability for the extension and improvement of our old age and survivors insurance system, for the special protection needed by veterans for a genuine and practical unemployment insurance program and for a national system of health insurance. This program also includes well considered methods for meeting its entire cost

Our entire program for the development of a unified comprehensive social security program worthy of a great nation in a position of world leadership is contained in Senate bill 1050

The proposal you have before you in the Senate bill 1606, therefore, represents but another part of an overall program

Thirty years ago we were definitely against the establishment of a health insurance program But our great democratic labor organizations in response to the expressed needs and wishes of the membership have steadily swung over to the support of this program to the point where in the last national convention of the American Federation of Labor which was held in New Orleans in 1944 it was adopted unanimously

Some of the enemies of this program have attempted to taunt us by quoting my predecessor Samuel Gompers in opposition to health posters which they offer free and on which they have reduced a picture of this great leader and quoted his words thirty years ago I think I knew Samuel Gompers as well as the people who are paying for the printing of these posters I know also that some of the same interests who now so willing to pay money to induce workers to follow Samuel Gompers leadership were willing when those words of his were uttered to pay money to get workers to forsake his leadership I knew Samuel Gompers as a progressive leader—one willing and ready to change his views with the changing times True to this tradition the American Federation of Labor which he founded has changed its position regarding health insurance to meet the changed conditions of our times

Working people were shocked just as other people were by the extent of physical unfitness that was revealed by the Selective Service examinations

Our people do not minimize the importance of the maintenance of satisfactory healthful conditions as they affect their life on the job and at home They know that good housing adequate nutrition and other environmental factors contribute materially toward good health To listen to some of the opponents of health insurance however you might conclude that if workers had these things they would not need doctors nurses or hospitals They should know better especially the doctors among them.

Out of their own family experiences working people have come to realize that the methods of meeting the costs of medical care have a direct and practical relationship to the availability of that care They know that generally individual savings do not provide a practical way of meeting these costs for the very simple reason that neither the time nor the amount of savings needed can be predicted And we know that the desperate resort to the loan shark often arises from the necessity of paying the cost attendant on sickness and that the largest single reason for the cashing of war saving bonds is illness

We in the American Federation of Labor have on occasions been charged with inconsistency because we have opposed compulsory arbitration and other forms of compulsion and adhered to our traditional principle of voluntarism while at the same time embracing compulsory health insurance We do not feel that our position is in the least in violation of our traditional principle as the element of compulsion in health insurance is confined to the matter of coverage and to the payment of contributions In other forms of compulsory legislation there are embodied compulsions that seriously limit the basic freedoms of citizens the compulsory features of our public education system where our children are required to attend school and all property owners are required to support the system To carry over into a discussion of this problem the usual connotations associated with the word compulsory as opposed to voluntary confuses rather than clarifies the issue As a matter of fact, the plans of some of the voluntary programs have demonstrated that they can be quite undemocratic Those for example now being advocated so vigorously by some of the medical societies place complete control of the plan including the expenditure of the funds in the hands of a single group whose members have a direct pecuniary interest in their operation They are completely devoid of any standards to govern the quality of service to be provided and provide for no representation on the part of those who are to pay their costs

Past experience of workers particularly with certain types of contract care have led them to be cautious about any proposal which might affect the quality of service In our opinion the passage of this bill would definitely encourage high quality medical care Doctors with whom we have consulted have informed us that when the ability of the individual patient to pay is a factor in his prescription of treatment, as it is under the present system the best quality of service is often denied

Especially during the past several years many of our unions have developed medical care programs for their members Our people naturally want to know whether the adoption of a national health program would permit the continuance of these cooperative endeavors During the preparation of this legislation we insisted on provision of the continuance of these plans being included, and we are satisfied that the provision is adequate. We are convinced that the bill makes ample provision for utilizing existing services and actually encourages the establishment of new ones when they are able to meet standards of service

One of the questions which workers always ask when these proposals are under discussion is Under the plan will we be able to choose our own doctor and our own hospital? I am very sure that the proposal for the establishment of health insurance would not have received the widespread support that it has among our trade union people if they were not assured that the freedom of choice of physician would be preserved and actually improved Our people are no different from others in that they cherish the personal relationship between doctor and patient and we have insisted that the provisions in this respect make doubly sure that free choice is protected Actually we feel that the bill if adopted would in a great many instances extend the principle of free choice as under our present system of payment the actual choice of physician on the part of those in dire need of service is limited to the number of doctors who are willing to render service in the face of the possibility or even probability that the patient will not be able to pay

Our membership is concerned about the degree to which any proposed legislation threatens to set up any centralized or autocratic control Despite the contentions of the opposition we are convinced that in S 1606 there is established a fair balance between administrative responsibilities and democratic administration Certainly officials of government agencies are given duties to perform and they are properly given the necessary authority to carry out these duties but their authority is limited through a system of checks and balances The rights of insured persons and of persons and agencies rendering services are carefully spelled out and rights of appeal from decisions are provided In addition the Surgeon General is specifically directed to decentralize the administration through the states and localities

The members of this committee are aware that the proposal for national health insurance has been subject to serious attack from various quarters We do not say that all of those who oppose this measure and who are in disagreement with us are dishonest men We do say however that some of the organizations which have been busily stirring up opposition to this bill depending largely on false and misleading slogans and expending huge amounts of money should be thoroughly investigated I say quite frankly to the members of this committee that in our opinion you will not have fulfilled your responsibility to the public in these hearings unless the sources of the funds for some of these organizations have been thoroughly investigated and made known to the public. The people of the country have a right to know and they have a right to expect from this committee what individuals and what corporations have contributed to the misleading campaigns of such organizations as the National Physicians Committee for the Extension of Medical Service and the Association of American Physicians and Surgeons Inc I have tried to make clear the reasons on which the American Federation of Labor bases its support of this bill Our purposes and our records are open and the basis of our support is common knowledge We think that the reasons for the opposition of the organizations I have named and their allies should be made equally public

Senator Donnell asked whether or not Mr Murray had investigated the probable cost under S 1050

Senator Donnell quoted Earl E Muntz who says

This would raise the estimates previously given to the following totals

1 Based on Senator Wagner's figures and remarks $11 625 000 000
2 Based on Tax Foundation study $11 787 000 000
3 Based on author's estimate $13 405 000 000

I take it that is Mr Muntz's estimate

4 Based on Hirschfield's study $14 625 000 000

I understand that is Mr Gerhard Hirschfield

SENATOR DONNELL As I understand this document in arriving at this federal subsidy he is assuming a 4 per cent contribution from employers and a 4 per cent contribution from employees and bases his view on the proposition that over and above that 4 per cent contribution from employees and 4 per cent contribution from employers there would be necessary federal subsidy of more than 50 per cent of these entire figures to which he refers MR GREEN Fifty per cent of that total

SENATOR ELLENDER I agree with you The point is though that in the event that the 4 per cent from employers and 4 per cent from employees is not sufficient, then you would advocate that the federal government dip into the treasury for the purpose of getting sufficient funds to make the program go along? MR. GREEN Well that should be reduced to the lowest possible cost. Because we do not want it to be a purely paternalistic affair We base it on the principles of insurance That is

what I emphasize in this statement, a contribution by employers and employees to the cost of providing the insurance payments, hospital care, medical care, laboratory care, special care, specialists, whatever may be needed in order to protect the health of the nation The health of the nation that is the point

*(Senator Donnell brought out that the costs might be 9 per cent Mr Green aided by Mr Cruikshank, indicated it might be necessary to diminish the coverage)*

SENATOR DONNELL You also referred Mr Green, in your testimony, to the figures of physical unfitness revealed by the Selective Service examinations, and I quote this language from your statement

"With the whole record now before us, these figures are more shocking than appeared at first Where we have been saying that a third of our young men were found physically unfit for the 'duties of citizens in wartime,' to use General Hershey's phrase, actually it is now revealed that fully a half of the young men failed to meet the army s standards '

What is the source, Mr Green of your statistical information there? MR. GREEN Selective Service

SENATOR DONNELL Selective Service. Now, I hold in my hand a document which I am told is from the Selective Service official figures Am I right in that, doctor? DR GOODRICH Yes

SENATOR DONNELL And I observe these facts, if I may summarize just a little. This is the figure at the top The "total number of rejections" were set out as 4 million 49 thousand which I understand from a penciled note to me is 30 per cent of all registrants examined Also, in this 4 million 49 thousand there are a considerable number who as I understand it are persons whose rejection was not cast as the result of facts arising from inadequate medical care or from disability which would disable a person from normal civilian activity For instance, here is 'mental diseases," 657,100 "Mental deficiency," 563 300 Then there is a series of physical defects, 'eyes," 206,100, 'ears," 156,100 Now, I shall submit later for the record more in detail on this, but the figures as given to me by my informant indicate that of the 4 million 49 thousand persons rejected, of that 100 per cent, 70 7 per cent were the result not of inadequate medical care or disability from normal civilian activity I am wondering whether or not your investigation and analysis of the Selective Service figures indicate substantially the same conclusions with respect to those figures? MR. GREEN I have not gone into that in detail in the way you have pointed it out.

SENATOR DONNELL Yes sir MR GREEN But I have accepted the Selective Services report, and, of course, the "eyes" and "mental deficiency' and "mental trouble," "eye trouble,' 'ear trouble," all of that may mean that if these people had been given proper medical care and attention for eyes and ears and mental deficiency they might have been restored to normal life

SENATOR MURRAY At that point, Mr Green, is it not true that most of the eye defects in the country occur at the time of birth?

MR GREEN That is what I say

SENATOR MURRAY Due to inadequate attention?

MR GREEN Most of the eye troubles occur during the infant period, many times, and sometimes during the birth period If you take a poor man, he has not the money to go out and get a specialist Under this plan they might save a lot of those eyes and that is what we are trying to do, save them

SENATOR DONNELL As I stated in my question, I shall go into this matter more fully when we have the physicians on the stand

SENATOR MURRAY We would be glad to have the author of that appear as a witness

SENATOR DONNELL Dr Goodrich from my state furnished this and he has in turn selected this from the Selective Service records. DR GOODRICH Yes sir

MR CRUIKSHANK Those are total rejections SENATOR DONNELL They are

MR CRUIKSHANK The difference in the figures is largely that that is a rejection figure whereas the Selective Service figures we used include the Army figures on the number of corrections and the number of discharges after induction, which brings them up to about 50 per cent

SENATOR MURRAY So that under the Selective Service many young men were brought into the service who had to be discharged MR GREEN That is right They found from experience that they were deficient

SENATOR DONNELL I shall examine into that more thoroughly Mr Chairman, with the permission of the committee, a little later

I would like the record also to show that there appears in this exhibit from which I have been reading this line

"Mental deficiency (1)"

Then the figures 563,300, the per cent as 13 9 And that note "1" appears as follows

'includes registrants rejected for educational deficiency before June 1, 1943 and for failure to meet minimum intelligence standards after that date, as well as those rejected for mental deficiency"

I offer that for the record

SENATOR MURRAY I might suggest at that point that many of those cases where they were rejected because of mental deficiency or educational deficiency may be due, more or less, to the failure of an adequate health care system in the United States MR GREEN Oh, yes, certainly Certainly, Senator

*(Mr Green and Senator Donnell differed in their interpretation as to the powers of the Surgeon General and the Advisory Board)*

SENATOR DONNELL I know you are perfectly honest in thinking that, and I might be mistaken, but I think the language of subdivision (j) on page 50 vests that particular authority exclusively in the Surgeon General with no remarks However, at any rate, the Advisory Council is merely advisory and not vested with authority to determine, that is correct, is it not? MR GREEN I think this is a little different I think by implication, at least, the Surgeon General is required to carry out the advice of the Advisory Council

SENATOR DONNELL Do you think there is any legal obligation in this bill? MR GREEN Probably not, but a moral obligation

SENATOR DONNELL Then you think the ultimate right is not in the Surgeon General but in the Advisory Council? MR GREEN I think in most of the questions that will come up that it will rest with the Advisory Board

SENATOR DONNELL Do you not think the bill should be clearly stated to the effect that the Advisory Council makes the decision and that that decision supersedes that of the Surgeon General? MR. GREEN If there is any conflict Either that it is the Surgeon General or the Advisory Board

SENATOR DONNELL As I read the bill, and I may be in error, but as I read the bill what I have read on that question in the bill would seem to indicate that the Council is an advisory council, and that the Surgeon General is not legally obligated to follow its recommendations MR GREEN We will go into that

SENATOR DONNELL Very well The point I am making is this As I see it, Mr Green, today if you or I were to go to this doctor I have spoken of he could decide for himself whether or not he had arrived at the maximum of his capacity, and there would be no government official to tell him whether he had or not? That is correct, is it not? MR GREEN Well, you must take the situation as you find it.

SENATOR DONNELL Your statement is that you feel this committee would be derelict in its responsibility to the public unless the source of the funds for some of these organizations had been thoroughly investigated and made known to the public. May I ask you if you have investigated the attitude of the American Medical Association with respect to this compulsory health insurance? MR GREEN In what respect? As I understand it, the American Medical Association is opposed to it

SENATOR DONNELL Did you mean, though by reference here to these various organizations the source of whose funds should be investigated did you mean to include the American Medical Association? MR GREEN I certainly did

SENATOR DONNELL You think that association should be included? MR GREEN I certainly do

SENATOR DONNELL You know that that association does contain a very large proportion of the practicing physicians and surgeons in the country? MR GREEN Yes, sir

SENATOR DONNELL And it is considered generally a very reputable organization? MR. GREEN That is right

MR. CRUIKSHANK May I make a comment on that, Mr Chairman? SENATOR MURRAY Yes

MR CRUIKSHANK Some time ago Miss Florence Thorne and I, both of whom were on President Green's staff, received a request from a committee of the American Medical Association to come over to the Mayflower Hotel in Washington to discuss with them the various proposals We consulted with President Green, and he told us by all means to consult with them, as representatives of the predominant group of the medical association We went over, and they, in the course of their discussions, asked us if we would be willing to confer with a committee of the American Medical Association on health insurance provisions, and particularly the provisions of the

Wagner Murray Dingell bill I think I can say that they were somewhat surprised when we responded that we would be very glad to confer with them any time, any place, at a meeting of their choosing We followed that up with a confirming letter That was over a year ago and we are still waiting the invitation of the American Medical Association to confer with them on this problem

SENATOR MURRAY I might ask there do you infer from that that they had no intention of discussing these problems with you at the time, and merely expected you to refuse to consult with them? MR. CRUIKSHANK We can only go on the record, Mr Chairman. The indication at the meeting was that they were somewhat surprised by our ready acceptance of their offer, and we have not yet received the invitation to confer with them

SENATOR DONNELL Do you recall to whom your letter was addressed? MR CRUIKSHANK It was the chairman of the committee, and the name of the committee has slipped my mind

SENATOR PEPPER Mr Green, you did not have to make an extended investigation or inquiry to discover the attitude of the American Medical Association? MR GREEN Certainly not.

SENATOR MORSE Mr Chairman, I would like to discuss with Mr Green a problem which may not seem at first glance to be directly connected with this bill, but I think it is pretty underlying as we come to consider the philosophy of government that we want to have maintained in this country Now, I am sure that Mr Green's answer will be in the affirmative to my inquiry, whether or not it is not true that the American Federation of Labor believes that the economy that can best maintain a decent standard of living for the American workers is a private property economy? That is true, is it not? MR GREEN That is right

SENATOR MORSE And that in order to maintain a private property economy we are going to have to maintain in this country to the maximum extent possible the profit motive, subject to regulations of government that will protect people from exploitation under that system That is correct, too, is it not? MR. GREEN That is correct

SENATOR MORSE And would you agree with me that we are faced in this country as so many nations of the world are faced, with competition among ideologies as to economic forms that ought to prevail and to be perfectly specific about it, we might as well face the fact that probably in a decade ahead there is going to be a considerable movement in this country for some form of state socialism in various activities of our economic life and that to the degree that state socialism comes to dominate this country, to that same degree of course the rights of workers as well as other individuals must be subordinated to a master state? Would you agree to that? MR. GREEN I agree with that.

SENATOR MORSE And that in this struggle however for the government to fulfil what I think are its minimum obligations, at least to protect as I have said so many times the economic weak from the exploitation of the economic strong our workers and people generally say to a democratic form of government you do have, as a government, the responsibility of removing from us as free men a constant fear of economic insecurity'? Do you think that is true? MR GREEN That is quite true Senator All of that is sound.

SENATOR MORSE We might as well face the fact that inherent in the labor movement in this country is the demand of free workers that this economy of work under a private property form be so operated as to reduce to the minimum the fear of economic insecurity and thus we who call ourselves 'liberals' are constantly fighting for minimum wage legislation or legislation that sets up minimum economic and social standards that will protect our people as a whole and in my judgment, protect the preservation of private property economy Now, with that movement going on in the decade ahead would you agree with me that one of the demands is going to be that the government use its resources in cooperating with the medical profession of this country to see to it that the fear of economic insecurity constantly hovering over the roof of every house in this country at least of our medium and low income groups be removed by providing those householders with decent medical care under a system which at the same time preserves to the greatest degree possible the private property conception and at the same time fulfils the obligation of the government to protect our people from the danger of ill health?

Or, to put it this way would you agree with me that the law of survival of the fittest still prevails even in our civilized society but that the workers of this country are insisting that the law of survival of the fittest should not operate on the basis of economic ability of the individual to survive as far as health is concerned? MR GREEN Yes You have brought out some very convincing points which I will agree with

SENATOR MORSE There is just one more point Would you agree with me that there is an obligation on the part of the medical profession to come forward with a program that will remove this fear from the workers of this country and still protect to the maximum degree possible and at the same time remove the constant fear of economic insecurity caused by ill health, to come forward with a plan that will remove that fear and still give to the American medical profession this so called private property economy that they claim under this proposal that you have testified in support of here to a degree is weakened? I am not saying it is or is not Do you agree that there is an obligation on that profession to demonstrate and come forward with a plan that removes that fear that is hovering over every roof in the land? MR GREEN I agree heartily with that conclusion and I want to say to you that never in the history of America did such an opportunity present itself to the medical profession to organized labor and to business groups to contribute toward the maintenance the establishment and maintenance of our free enterprise system than now SENATOR MORSE I agree with you

*(Mr Green discussed at great length his part in securing workmen's compensation legislation in Ohio)*

SENATOR PEPPER I was just going to say that we all know that one of the most severe criticisms leveled against this bill is that same old catch word of 'socialism' MR GREEN That is right SENATOR PEPPER They say "Are you in favor of that Wagner-Murray Dingell bill? That is that socialized medicine bill" Do you regard Mr Green a national law which requires compulsory membership in a national insurance program as being socialism in any form? MR GREEN None whatever SENATOR PEPPER Is it any different in principle from the present law that nobody has suggested the repeal of what has been on the statute books of the nation by which under national compulsion employees and employers contribute to a fund to insure the worker against unemployment in the country? MR GREEN The same principle is involved SENATOR PEPPER Exactly MR GREEN There is no difference There is nothing socialistic about that.

SENATOR PEPPER In the various states of the union we have compulsory school laws, where parents are required by the state to send children to school in the public interest and we do not want to call those things socialistic. MR. GREEN No

SENATOR PEPPER Socialist medicine would perhaps be the kind in Russia where the patient pays nothing at all where the state does the whole thing? MR GREEN Yes The whole thing

SENATOR PEPPER And that, of course is not this bill in any sense MR GREEN This is positively insurance based on our sound insurance system

SENATOR MURRAY This maintains the American medical profession in this country and will have the effect of raising the income of a great majority of the doctors of the country MR GREEN That is right

SENATOR DONNELL Mr Green under this plan in S 1606 doctors who are paid from the monies raised in pursuance of the development of this plan will be employees of the government to that extent will they not? MR GREEN No I would not regard them as employees of the government. They are simply being paid out of a fund created through contributions from employers and employees SENATOR DONNELL You would not regard them as employees of the government? MR. GREEN No

SENATOR DONNELL Mr Green while I appreciate the comments made with respect to the health of our people after all the question here is the means of bringing that about There may be an honest difference of opinion as to that? MR GREEN That is right But the trouble is we have been experimenting for how long has the government been here one hundred and seventy-five or two hundred years?

*(Senator Donnell brought out that Mr Green has no confidence in the success of voluntary plans)*

SENATOR DONNELL Have you studied what happened in England with respect to initiative and the development of ability among the physicians over there? MR GREEN Perhaps not as much as I should Do you know about the health insurance they passed over there in England?

SENATOR DONNELL But I want to say this what I am asking you about is whether or not you have studied the English experience with a view to determining what has been the effect on the development of initiative among the English physicians? Have you studied that? MR GREEN No I have not gone into that

SENATOR DONNELL We are studying here, trying to find out things We are happy to have testimony from anybody who knows and can give us advice I do not claim to know all about this and what I do not know fills more volumes than what I do know which is very small In the matter of the experience of New Zealand they have had experience which for some reason has not proved satisfactory Do you know why that is MR GREEN I do not know I could not tell you Senator

SENATOR DONNELL My understanding is that in New Zealand their plan has pretty largely failed It may be due to something entirely contrary to the basic principles I do not know MR GREEN I am sorry I could not give you information on that because I admit I have none

SENATOR PEPPER Senator Donnell a minute ago referred to the 21 million covered under the Blue Cross plans I am sure the Senator did not mean to imply that in excess of about 3 per cent of the people of this country have anything like the total coverage under the voluntary plans that is provided in this bill There are perhaps 21 million people who have different kinds of coverage SENATOR DONNELL Yes

SENATOR PEPPER But our subcommittee disclosed facts, after comprehensive examination of all voluntary plans in existence that only about 3 per cent of the total people in the country have anything like the total coverage of this bill MR GREEN Yes

SENATOR DONNELL I had no intention of leaving any thought like that

SENATOR PEPPER We also disclosed in our inquiry that under the most favorable system the voluntary plans were not a success For example that the Department of Agriculture through the Farm Security Administration tried in the rural area and got through experimenting and subsidizing the voluntary plans with federal funds, poor results Even there, where they were voluntary plans in character the ones who needed the medical care the most dropped out first or failed to join MR GREEN That is the way it operates

SENATOR PEPPER So the Department of Agriculture in a brochure they prepared at the request of this committee, advised us that under any most favorable system the voluntary plan had not been a success MR GREEN That is my understanding

(The documents referred to are as follows )

*(Senator Murray submitted for the record statements from the State Federations of Labor of Kentucky, Kansas Connecticut and West Virginia and from the Building Service Employees Maintenance Union the Atlanta Ga Federation of Trades and the Central Labor Union of North Platte, Neb )*

### Statement of Dr W Montague Cobb, Representing the National Medical Committee of the National Association for the Advancement of Colored People

DR COBB My name is William Montague Cobb I am a physician professor of anatomy in the School of Medicine of Howard University president of the Medico-Chirurgical Society of the District of Columbia and I am appearing as a member of the National Medical Committee of the National Association for the Advancement of Colored People

It is my honor to represent as a member of its National Medical Committee the National Association for the Advancement of Colored People, in support of the National Health Bill S 1606 The National Association founded in 1909 has over 520 000 members organized into twelve hundred branches youth councils and college chapters in forty-three states It is the oldest and largest organization devoted to the securing of equal rights and opportunities for the more than 14 000 000 citizens who constitute America s most disadvantaged tenth

Even though health conditions in the country as a whole are far from satisfactory, the plight of the Negro is worse than that of the white In 1940, the latest census year the standardized death rate for the country was 8 2 per thousand for whites and 14 0 for Negroes a mortality rate 71 per cent higher than the white In 1930 the Negro excess was 82 per cent In that year the Negro mortality in the registration states was 81 per cent higher than the white in rural areas and 95 per cent higher in cities a fact of especial significance in view of the continued urban migration of Negroes

In 1940 the life expectation of Negroes at birth was about ten years less than that of whites the expectancy being for males 52.26 years in Negroes and 62 81 years in whites, and for females 55 56 years in Negroes and 67 29 years in whites

The consistent population increase shown by the Negro in spite of the high mortality and morbidity he has suffered has been due chiefly to his high birth rate which in 1942 was 23 3 as compared with 20 7 for the white But the reproductive process in the Negro is attended with almost double the rate of casualties that prevails in the white In 1942 the Negro maternal death rate was 5 5 and the white 2 2 the Negro infant mortality rate was 64 2 and the white 37 3, and the stillbirth rate was 50 5 in the Negro and 25 5 in the white

In retrospect, this approximately current unfavorable health picture shows considerable improvement over the past The Negro mortality rate has declined from 24 1 in 1910 to 14 8 in 1943 Since 1910 Negro life expectancy has increased about ten years, or 25 per cent There has been significant decrease also in reproductive mortality

The National Health Survey of 1935 1936 found that the amount of disability per person due to illnesses which incapacitated for a week or longer was 43 per cent higher in the Negro than in the white population The higher disability rate for Negroes was due chiefly to chronic diseases, which disabled the average Negro eight days per year compared with five days for the average white person The higher rate was observed for all disease groups Pneumonia was almost twice as frequent in Negroes as in whites and certain chronic diseases—the cardiovascular-renal group, rheumatism, and asthma and hay fever—were of significantly higher rate

The Survey noted that improvement of standard of living associated with a rising income increased the health status of Negroes as measured by various indices of illness The average Negro in the non-relief class experienced only one half the disability per year as the Negro on relief The survey concluded that low economic status rather than inherent racial characteristics in reaction to disease appeared to account principally for the higher disability rate in Negroes

The association I represent affirms that the vision of separate, but equal facilities for the care of Negro population in those areas where that population is concentrated has always been a myth, and would prove again to be a myth should it be attempted Specifically the association wishes to declare against the principle in the application of this bill to the development of separate hospitals, separate health centers separate training programs and separate public health programs We wish to declare emphatically for the elimination of the entire racial separation practice in the construction of any new facilities, and in the operation of all new plans for the distribution of medical care and for the integration of Negro professional personnel into all levels of the plan according to qualification Recent experience with attempts to assure adequate professional personnel through the separate system of professional education have proved how sterile and ineffective is this plan It has resulted in there being not only inadequate numbers of general practitioners (and nurses), but also of specialists in the respective fields

In many states, including the entire South and the District of Columbia, local medical societies have consistently barred Negro physicians from membership and the American Medical Association through the technicality of not admitting to its membership physicians who are not members of their local societies has extended the effect of this racial discrimination This Association, therefore, would see no outlook but the perpetuation of these discriminatory practices in the administration of a national health program and advocates that the administration be entirely in the hands of responsible public officials

*(The questioning was limited to the auspices under which Dr Cobb appeared It seemed he had been asked by the chairman of his board of directors to appear )*

### Statements of Pauline M Newman, Representing the National Women's Trade Union League of America, and of Miss Elisabeth Christman, Secretary-Treasurer of the National Women's Trade Union League of America

MISS NEWMAN The National Women s Trade Union League of America with a direct and affiliated membership of more than a million persons wishes to go on record in support of the Wagner-Murray Dingell National Health Act

*(Miss Newman told of the advantages of a prepaid plan )*

We are told that good health is purchasable Certainly so are precious jewels in Tiffany s How many of us would even dream of going to Tiffany s? How many of us can afford to purchase medical care from private physicians? Suppose Mr Chairman, we try and see what an ordinary diagnostic examination or as our English friends call it, an "over hauling,' in a private physician s office comes to

Jennie the operator decides to have such an examination and finds that the fee for the first visit to the doctor is $5 This doctor is not a 'top notcher," but an average reputable man He will want some laboratory tests—a blood count and urinalysis will cost $5 No routine examination should be made without a chest x-ray , that will cost a minimum of another $10

If there is nothing organically wrong with Jennie the doctor will prescribe some medication which will come to about $2 Here you have a total of $22 for an incomplete medical check up

I repeat that this examination is incomplete It does not include an electrocardiogram It does not include a gastro intestinal x-ray examination and the additional tests which are essential to a thorough diagnostic examination And yet Jennie has paid $22 merely to find out if anything is wrong with her health! Do you see now why it is that Jennie and her kind think long and hard before they will go to a private physician? Their limited income does not allow for such luxury It is this inability to meet the cost of medical care that prevents the wage-earner from consulting a physician until he is no longer able to work or to see a dentist until he is no longer able to endure his toothache

At this point some one may well ask Why should not Jennie and her kind use the services of our public health clinics This is a pertinent question But I think I can give you the reasons why Jennie and her kind do not like to go to those clinics

1 She will in all probability have to absent herself from her work a whole day The services of those clinics are not now available in the evenings

2 Jennie does not care for charity any more than do the rest of us *In fact Jennie would much rather pay for medical* or any other service she gets provided the cost is within her ability to pay Jennie and her kind do not want to get anything for nothing

3 And finally Jennie will tell you that if our public health clinics are to be used by people like herself they will have to be of a different type from those with which we are now familiar I happen to know quite a bit about those clinics and I am here to tell you that they are not what they might have been—the pride of a community

The physical surroundings alone are enough to discourage a sick person from going there—those hard and uncomfortable benches the cheerless and frosty atmosphere the lack of privacy the absence of kindliness and understanding the needless questioning the humiliation the hard-boiled attitude—all this and more is cause enough for Jennie and her like to stay away from these clinics Until these health clinics are infused with a spirit of helpfulness and real desire to render decent service Jennie and people like her will be reluctant to use the public health clinic

I maintain Mr Chairman, that while we have made excellent progress in medical science the fruits of this scientific knowledge are not now available to the working men and women of our land But the most deplorable thing of all I think is the fact that even the clinics I have described above are non existent in so many parts of this country! That this should be so is unbelievable but it is a fact as you gentlemen of the committee must know

*(Questioning by Senator Donnell concerned the nature of the Trade Union League and the manner of its function)*

SENATOR DONNELL That is who come to this national meeting?

MISS NEWMAN Yes sir

SENATOR DONNELL When was the last one of those held those meetings?

MISS NEWMAN Last May we had a conference right here in Washington with delegates coming from every one of our local affiliates

SENATOR DONNELL And you had six or seven hundred people at that meeting?

MISS NEWMAN Not at the last conference

SENATOR DONNELL How many did you have

MISS NEWMAN At the last conference I should say that there were close to 100 delegates from our local units

SENATOR DONNELL That is close to 100 delegates?

MISS NEWMAN That is right

SENATOR DONNELL When was that meeting held?

MISS NEWMAN Last May

SENATOR DONNELL Here in Washington?

MISS NEWMAN That is right

SENATOR DONNELL That is what you call the delegate meeting of your entire membership?

MISS NEWMAN Just one moment May I explain this You remember do you not that conventions were forbidden for a time while the war lasted

SENATOR DONNELL Yes

*(To be continued)*

# Medical Legislation

## MEDICAL BILLS IN CONGRESS

### Army and Navy Medical Schools

A bill introduced by Representative Somers, New York, H R 6073, proposes the establishment of a school for the instruction of cadets in the theory and practice of medicine and surgery, to be known as the United States Military Medical School The corps of cadets of the school will be selected on the same terms and conditions as cadets are selected and admitted to the United States Military Academy Each cadet will agree to serve with the United States government for six years after graduation and will receive the same pay and allowances as are provided for cadets in the United States Military Academy On graduation any cadet may be commissioned as a second lieutenant in the United States Army will receive his internship in an Army hospital on completion of which he will be assigned to duty with the Army or to duty in a hospital under the jurisdiction of the Veterans' Administration Another bill introduced by Representative Somers, H R 6074, provides for the establishment of a United States Naval Medical School

### Barbiturates

H R 6178 introduced by Representative Rogers Massachusetts, provides for the coverage of barbiturates under the federal narcotic laws Another bill, S 1986 has passed the Senate, proposing to bring the barbiturates within the purview of the narcotic laws applicable to the District of Columbia

### Miscellaneous

A bill to authorize the Veterans Administration to employ retired officers without affecting their retired status H R 5626 has passed the House The purpose of the bill is to authorize the Veterans' Administration to employ between 20 and 25 retired medical officers to act as superintendents and directors of medical services in veterans' hospitals

A bill relating to the prevention and control of water pollution H R 6024, has been favorably reported by the House Committee on Rivers and Harbors

S 1850, to establish a National Science Foundation has been reported without amendment by the Senate Committee on Military Affairs

Legislation to authorize the Federal Security Administrator to assist the states in matters relating to social protection, S 1779 has been reported without amendment by the Senate Committee on Education and Labor

## STATE LEGISLATION

### Massachusetts

*Bill Introduced*—H 1784 proposes the creation of a board of registration of chiropractors and defines chiropractic as the science of locating and removing by hand only interference with the transmission or expression of nerve force in the human body and the correction of misalignment or subluxations of the vertebral column It excludes operative surgery prescription or use of drugs or medicine or the practice of obstetrics except that the X-ray may be used solely for the purposes of examinations

*Bills Passed*—H 1749 passed the house April 16 It proposes that the College of Physicians and Surgeons a Massachusetts corporation duly organized and established in 1880, be dissolved

S 462 passed the house April 17 Relating to the replacement of a city board of health by a city health department it proposes that the commissioner of health shall be a citizen of the United States who has been graduated from a medical school approved by the state authority for the approval of medicine schools and either shall be the holder of a degree of public health with at least two years' full time experience in a responsible position in public health service or shall have had four years full time experience in a responsible position in such service He shall be eligible to be registered to practice medicine under the laws of the state

S 464 passed the senate April 17 To amend the law relating to opticians, it proposes certain restrictions upon the type of advertising in which an optician may engage.

### Mississippi

*Bills Enacted*—H 433 was approved April 9, 1946 It provides an appropriation of $5,000,000 to the Mississippi Commission on Hospital Care for carrying out the provisions of the law creating such commission and for the purpose of building, erecting and equipping, and contributing to the building, erecting and equipping of hospitals, nurses' homes and other facilities

H 699 was approved April 10, 1946 As reported last week, it authorizes the state board of examiners to proceed by injunction to prohibit any person from practicing any profession licensed under the supervision of said board when such person is not duly licensed so to practice, except persons practicing chiropractic, osteopathic or veterinary sciences A copy of the bill as finally approved indicates that it also exempts persons practicing "drugless healing other than surgery"

H 754 was approved April 9, 1946 It authorizes any municipality within the state, in the discretion of its governing authorities, to adopt sanitary codes or any other codes dealing with general public health

—H. 1137 was approved April 10, 1946 It provides additional riations for support of the medical school of the Uni- of Mississippi and for the purchase of equipment and s therefor

256 was approved April 9, 1946 It provides for the nent of charity patients in any hospital in the state ved by the Mississippi division of the American Cancer ety and equipped and prepared to treat cancer upon ffidavits by the county health officer and one other reputable physician that the patient is in need of care, treatment and hospitalization because of cancer

### Missouri

*Bill Enacted*—S 424 was approved April 19, 1946 It transfers to the State Board of Medical Examiners powers and duties heretofore vested in the state board of health

### New Jersey

*Bills Enacted*—A 164 has become chapter 84 of the Laws of 1946 It amends the medical practice act by providing for an addition to the State Board of Medical Examiners of a chiropodist to have equal rights and privileges in all matters affecting chiropody

S 120 has become chapter 118 of the Laws of 1946 It provides for the establishment of a diagnostic center to be fully equipped with all modern scientific equipment and provided with a staff of competent specialists in the field of medicine, psychiatry and psychology, to the end that full and complete diagnostic services shall be available to any governmental agency desiring to secure a complete diagnosis of any individual having need for such services

### New York

*Bills Enacted*—A 1223 has become chapter 802 of the Laws of 1946 It provides for the examination licensing and regulating of persons desiring to practice hairdressing and cosmetology

A 2680 has become chapter 898 of the Laws of 1946 It authorizes a town board, in lieu of employing a public health nurse or public health nurses to contract with any nonprofit institution or agency wholly or partly under private control organized to furnish visiting nursing or public health services and agree to pay fees specified in the contract for such services furnished to inhabitants of the town

S 1033 has become chapter 801 of the Laws of 1946 It provides for the licensing and regulating of the practice of barbering

### Rhode Island

*Bill Passed*—S 266 passed the senate and house April 18 It proposes a joint resolution to revivify the special Rhode Island public health laws survey commission and to appropriate funds to enable the commission to continue its work.

## Coming Medical Meetings

American Association for the Study of Goiter Chicago June 20-23 Dr Thomas C Davison 478 Peachtree St N E, Atlanta 3 Ga, Secretary

American Association for the Surgery of Trauma San Antonio, Texas June 26 28 Dr Gordon M Morrison, 520 Commonwealth Ave, Boston, Secretary

American Association for Thoracic Surgery, Detroit May 29 31 Dr Richard H Meade Jr Kennedy General Hospital Memphis 15 Tenn, Secretary

American Association of Genito Urinary Surgeons Stockbridge Mass June 20 22 Dr Charles C Higgins 2020 E 93d St Cleveland 6, Secretary

American Association of Plastic Surgeons Toronto Canada June 3 4 Dr Frederick A Figi, 102 Second Ave S W Rochester Minn Secretary

American Association of the History of Medicine Atlantic City May 26 27 Mr W B McDaniel II 19 S 22d St Philadelphia 3 Secretary

American Broncho-Esophagological Association, Chicago May 31 Dr Paul H Holinger 700 N Michigan Ave Chicago 11 Secretary

American College of Physicians Philadelphia May 13 17 Mr E. R. Loveland 4200 Pine St. Philadelphia 4 Executive Secretary

*American College of Radiology, San Francisco June 29* Mr Mac F Cahal 20 N Wacker Drive, Chicago 6 Secretary

American Dermatological Association Hot Springs Va, June 10-14 Dr Harry R. Foerster 208 E. Wisconsin Ave Milwaukee Secretary

American Federation for Clinical Research Atlantic City May 28 Dr Richard H Lyons University Hospital Ann Arbor Mich Secretary

American Gastro-Enterological Association Atlantic City May 24-25 Dr J Arnold Bargen 102 Second Ave, S W, Rochester, Minn, Secretary

American Laryngological Association Chicago May 29 30 Dr Arthur W Proetz 3720 Washington Blvd, St Louis 8 Secretary

American Laryngological Rhinological and Otological Society Chicago May 27 28 Dr C Stewart Nash 277 Alexander St Rochester 7, New York Secretary

American Neurological Association San Francisco June 26-28 Dr Henry Alsop Riley 117 E 72d St New York 21 Secretary

American Ophthalmological Society San Francisco June 26-28 Dr Walter S Atkinson 129 Clinton St Watertown N Y Secretary

American Orthopedic Association Hot Springs Va June 27 29 Dr Charles W Peabody 474 Fisher Bldg Detroit 2, Secretary

American Otological Society Chicago May 31 June 1 Dr Gordon D Hoople 713 E Genesee St Syracuse N Y Secretary

American Psychiatric Association Chicago, May 27 30 Dr Winfred Overholser St. Elizabeths Hospital Washington 20 D C Secretary

American Radium Society San Francisco June 28 29 Dr Edward H Skinner 1103 Grand Ave Kansas City 6 Mo, Secretary

American Society for Clinical Investigation, Atlantic City May 27 Dr Eugene A Stead Jr Grady Hospital Atlanta 3 Ga Secretary

American Society for Research in Psychosomatic Problems New York May 11 12 Dr Edwin G Zabriskie, 714 Madison Ave New York 21 Secretary

American Therapeutic Society Atlantic City May 11 12 Dr Oscar B Hunter 1835 I St N W Washington D C Secretary

Association for the Study of Internal Secretions San Francisco June 28 29 Dr Henry H Turner, 1200 N Walter St Oklahoma City, Secretary

Association of American Physicians Atlantic City, May 28 29 Dr Joseph T Wearn 2065 Adelbert Road Cleveland 6 Secretary

California Medical Association Los Angeles, May 7 10 Dr George H Kress 450 Sutter St San Francisco 8 Secretary

Georgia Medical Association of Macon May 7 10 Dr Edgar D Shanks 478 Peachtree St N E. Atlanta Secretary

Illinois State Medical Society Chicago May 14 16 Dr Harold M. Camp 224 S Main St Monmouth Secretary

Louisiana State Medical Society Alexandria May 6-8 Dr P T Talbot 1430 Tulane Ave New Orleans 13 Secretary

Maine Medical Association, Poland Spring June 23 25 Dr Frederick R Carter 142 High Street Portland 3 Secretary

Massachusetts Medical Society Boston May 21 23 Dr Michael A Tighe 8 Fenway Boston Secretary

Minnesota State Medical Association St Paul May 20 22 Dr B B Souster Lowry Medical Arts Bldg St Paul 2 Secretary

Mississippi State Medical Association Jackson May 14 15 Dr T M Dye Box 295 Clarksdale Secretary

National Tuberculosis Association Buffalo N Y June 11 13 Dr Charles J Hatfield 1790 Broadway New York 19 Secretary

Nebraska State Medical Association Lincoln May 6-9 Dr R. B Adams 416 Federal Securities Bldg Lincoln 8 Secretary

New Hampshire Medical Society Manchester May 14 Dr C R. Metcalf 5 S State St Concord Secretary

New Jersey Medical Society of Atlantic City May 21 23 Dr Alfred Stahl 55 Lincoln Park Newark Secretary

New Mexico Medical Society *Santa Fe, June 6-8* Dr L B Cohenour 221 W Central Ave Albuquerque Secretary

North Dakota State Medical Association Bismarck May 26-28 Dr L W Larson 221 Fifth St. Bismarck Secretary

Ohio State Medical Association Columbus May 7 9 Mr Charles S Nelson 79 E State St Columbus Executive Secretary

Rhode Island Medical Society Providence May 15 16 Dr William P Buffum 122 Waterman St. Providence 6 Secretary

Society of American Bacteriologists Detroit May 21 24 Dr Leland W Parr 1335 H St N W Washington 5 D C Secretary

South Dakota State Medical Association Aberdeen June 1 4 Dr Roland G Mayer 22½ S Main St Aberdeen Secretary

Texas, State Medical Association of Galveston May 6-9 Dr Holman Taylor 1404 W El Paso St. Fort Worth 3 Secretary

West Virginia Medical Association Huntington May 13 15 Mr Charles Lively P O Box 1031 Charleston 24 Executive Secretary

# Medical News

(Physicians will confer a favor by sending for this department items of news of more or less general interest such as relate to society activities, new hospitals, education and public health.)

## CALIFORNIA

**Appointments to Southern California**—Dr George C Griffith, formerly of Philadelphia, and Dr M Paul Starr, Pasadena, have been appointed clinical professors of medicine at the University of Southern California School of Medicine, Los Angeles.

**Changes in Health Personnel**—Dr Miriam Hubbell, El Centro, has resigned as health officer of Imperial County, effective March 1, to join the Los Angeles County Health Department in Glendale.——Dr Harold J Franklin, formerly of Trenton, N J, has been named acting health officer for Imperial County.——Dr Lenox S Goerke, formerly of Woodland, recently discharged as lieutenant colonel from the Army Medical Corps, has been appointed director of the bureau of medical services of the Los Angeles City Health Department. Dr Norman B Nelson, Los Angeles, who formerly held this position, has become head of the department of public health at the University of California, Los Angeles. Dr Goerke is returning to public health work after five years of army service, three years of which were with the selective service system and southern area headquarters in southern California. In November Dr Goerke returned from duty overseas with the 89th division.

**Warning of Smallpox Patient**—On April 5 a man was diagnosed as having smallpox after being granted shore leave in San Francisco April 2, the day after the steamship *La Salle*, from an oriental country, had been released from smallpox quarantine. The ship had been docked at Hunters Point April 2-4. The patient had boarded a public bus at Hunters Point. He had visited one Bank of America and one Western Union office, stopped at a restaurant to eat and attended two theaters, after which he had taken the public bus again to Hunters Point where he ate in another restaurant there. The patient had fever on April 3 and probably on April 2, and a rash on April 4 and 5. The warning issued by the health officer of the city and county of San Francisco, Dr Jacob C Geiger, states that the employees of the Paramount and State theaters, which had been visited by the patient, had been previously vaccinated.

## COLORADO

**Spring Clinic**—The Mesa County Medical Society announces the revival of the annual Western Slope Spring Clinic, to be held in the City Library Auditorium, Grand Junction, May 12, the first in three years. The following, all of Denver, will speak:

Dr William R Lipscomb: What to Consider the Diagnosis of Intervertebral Disk.
Dr George B Packard: Gastric Ulcer.
Dr Maurice Katzman: Significance of Heart Murmurs and the Use of the Electrocardiogram.
Dr Kenneth D A Allen: The Findings Depicted by a Simple Scout Film of the Abdomen.
Dr Bernardine T McMahon: Chest Problems in General Practice.
Dr Charles B Kingry: Interpretation and Use of the Newer Laboratory Tests.

## DISTRICT OF COLUMBIA

**Personal**—Dr Alfred Golden, Washington, has been named assistant professor of pathology at the University of Tennessee College of Medicine, Memphis, and director of laboratories at the Baptist Memorial Hospital, Memphis.

**John Lawlah Resigns as Dean**—Dr John W Lawlah, dean and professor of radiology, Howard University School of Medicine, Washington, announced his resignation as dean to devote his entire time to work in his specialty. The Washington *Star* announced that Dr Lawlah had requested his resignation to take effect April 1.

## FLORIDA

**Special Wartime Permits to Expire July 1**—All special wartime certificates permitting medical doctors to practice in Florida without passing the regular board of medical examiners tests will expire July 1. About sixty physicians, mostly retired doctors from other states, were granted special licenses by the state defense council and board of medical examiners to help fill the gaps left by Florida doctors who were called into military service. If they want to continue their Florida practices after July 1, they must obtain certificates of proficiency from the basic science board which meets June 4 and then pass the board of medical examiners tests on June 24-25. Florida law does not provide for recognition of medical licenses granted in other states or permit temporary peacetime licenses, according to the Tampa *Tribune*.

## GEORGIA

**New Health Unit**—The counties of Thomas and Grady have joined together to form the Thomas-Grady health unit, with headquarters in Albany. Dr Arthur W Hill, Atlanta, formerly with the State Department of Public Health in malaria and hookworm service, has accepted the position of commissioner of health.

**Personal**—Dr Guy V Rice Jr, Albany, recently returned from military service, has been named assistant director of the division of maternal and child health of the Georgia State Board of Health, succeeding Dr William B Harrison, who resigned to become regional medical director for both the northeastern and northwestern sections.

## ILLINOIS

**Herrick House Opens for Year Round Service**—Herrick House in Bartlett, one of the few homes in the country for children convalescing from rheumatic fever, opened April 4 for year round service after being operated heretofore only during the four months in the summer. The 40 children who were admitted were patients in various hospitals. They will spend about three months learning how to live comfortably and usefully and were selected by social agencies in Chicago and the Fox River valley. Herrick House is operated by the Sunset Camp Service League. It functions under a medical advisory committee headed by Dr James B Herrick, for whom the institution is named, and Dr Stanley Gibson, both of Chicago.

### Chicago

**Northwestern Class of 1911 Holds Reunion**—The thirty-fifth reunion of the class of 1911 of the Northwestern University Medical School will be held June 1 at the Hotel La Salle. Dr Louis Rudolph, 55 East Washington Street, is secretary.

**Alumni Reunion.**—The Alumni Association of Loyola University School of Medicine will hold a meeting during the session of the Illinois State Medical Society in Chicago May 15. At a luncheon James T Hussey, S J, president of Loyola University, will speak. Reservations should be made with the Alumni Office, 6525 Sheridan Road. Rev G G Grant, S J, is secretary of the alumni association.

**Roger Harvey Named Professor of Radiology**—Dr Roger A Harvey, assistant professor of medicine and radiology at the University of Rochester School of Medicine and Dentistry, has been appointed professor and head of the department of radiology at the University of Illinois College of Medicine, effective August 1. The appointment fills the vacancy that occurred with the death in 1944 of Dr Adolph Hartung. Dr Harvey graduated at the University of Rochester in 1939.

**Earl Kleinschmidt to Direct Tuberculosis Institute**—Dr Earl E Kleinschmidt, formerly health commissioner of Toledo and recently released from military service, has been named director of the Tuberculosis Institute of Chicago and Cook County. He will succeed Mrs Theodore B Sachs who has retired after more than twenty years' service. Mrs Sachs is the widow of Dr Theodore Sachs, founder of the institute, who died in 1916.

**Executive Secretary Named for Association for Crippled**—William C Harder, who for the past three years as regional supervisor for federal works directed programs designed to assist war impacted communities in Illinois, Indiana, Michigan, Ohio, Kentucky and Wisconsin, has been appointed executive secretary of the Illinois Association for the Crippled, 116 South Michigan Avenue. He succeeds Edgar T Stephens, who recently became chief of rehabilitation services for the state of Illinois.

**Research in Blood Diseases**—The Hematology Research Foundation invites applications for the Ruth Reader fellowship for research in blood diseases. The value of this fellowship is $1,500 for one year. It is offered to workers of any race or creed in America. Applications must be submitted no later than June 1 to Dr Ludvig Hektoen, 21 West Elm Street, Chicago, the chairman of the medical advisory council for the foundation. The council will choose the applicant and the institution in Chicago, in which the work is to be done, on the basis of merit.

**Ray Brown Named Superintendent of Clinics**—Ray E Brown assistant superintendent of the University of Chicago Clinics has been appointed to succeed Dr George O Whitecotton as superintendent, it was announced April 23 Dr Whitecotton who has been superintendent of the University Clinics since 1939 resigned to become medical director of the Alameda County Institutions and superintendent of Highland-Alameda County Hospital of Oakland, Calif (THE JOURNAL, March 16 p 725) Mr Brown who was first appointed to the hospital staff in September 1945 was superintendent and professor of hospital administration of the North Carolina Baptist Hospital of the Bowman Gray School of Medicine, Winston-Salem, N C from 1943 to 1945

**Membership to Medical Center Commission**—Dr Raymond B Allen, executive dean of the University of Illinois Chicago Colleges was elected president of the Medical Center Commission at a meeting April 18, at the University Club He succeeds Col Albert A Sprague the former president, who died April 6 Dr Allen had served the medical center commission as vice president previous to being elected to the presidency He will leave Chicago in August to serve as president of the University of Washington Seattle On the commission in addition to Dr Allen are Mr David H Brill, Mr Albert D Farwell treasurer Mr Lester W Norris, St Charles Ill, Mr Carl Stockholm and Dr Walter H Theobald, assistant professor of laryngology rhinology and otology at the University of Illinois College of Medicine

**Club for Spastics Formed**—The Young Adult Spastic Club has been organized in Chicago It aims to provide social and friendly relationships before undertaking a planned program The advisability of providing a speech therapy program under the direction of a speech pathologist is under consideration Officers of the club which is open to any victim of cerebral palsy between the ages of 18 and 35 living in Metropolitan Chicago are Henry Schmidtke college student, president, Joyce Halloway, high school senior, vice president Ruth Tully, employed in a department store secretary Richard Koplin, college student treasurer, and F Hall Roe confined at home, corresponding secretary Serving as members of the board of directors are

Kenneth Flanagan director of recreation National Society for Crippled Children and Adults
Roy G Franklin president Spastic Paralysis Aid Foundation
Mrs Blanch Mulder service director Illinois Association for the Crippled
Alma O Finnegan Instructor Spalding School for handicapped children
Carolyn Siegal and Marvin Steinberg both students at Spalding High School

The club is being sponsored by the Illinois Association for the Crippled and the Spastic Paralysis Aid Foundation which are meeting refreshment and transportation costs, respectively The Spastic Paralysis Aid Foundation was formed in June 1945 It is composed of parents who have young spastic children Mrs A E Schneider is the secretary

## MASSACHUSETTS

**Alumni Reunion**—The Alumni Association of Boston University School of Medicine will sponsor a two day continuation course as a special feature of its reunion, May 10-11 A wide range of medical topics will be discussed Dr James R. Miller, Hartford Conn a Trustee of the American Medical Association will be the principal speaker at the banquet in the evening at the Hotel Statler

**Special Society Elections** —At the thirty-fourth meeting of the American Society for Pharmacology and Experimental Therapeutics in Atlantic City, March 11 15, Dr Maurice H Seevers, Ann Arbor, Mich, was elected president Other officers include Drs Harry B Van Dyke New York, vice president, Harvey B Haag, Richmond, Va. secretary, and McKeen Cattell New York, treasurer ——Dr Paul R Cannon, Chicago was elected president of the American Society for Experimental Pathology at its meeting in Atlantic City, March 12 and Dr Douglas H Sprunt, Memphis vice president Frieda S Robscheit-Robbins, Ph D, Rochester, N Y, is secretary-treasurer

**Medical Director for Glass Company**—Dr Charles F Shook M C, on terminal leave from service in the army, has been named medical director of the Owens-Illinois Glass Company, a newly created position Dr Shook graduated at Creighton University School of Medicine, Omaha, in 1916. During his army career he graduated from the Army Sanitary School the School of Aviation Medicine and the Army Industrial College He spent thirteen years in the military service as a flight surgeon and ten years in New York and Washington in procurement planning for medical supplies and equipment. Dr Shook was deputy chief surgeon to Major Gen Paul R Hawley for the European theater His most recent assignment was closing hospitals in France, England and Belgium and disposal of excess supplies

**A Hundred Thousand Dollars for Pediatric Study**—The Rockefeller Foundation has given more than $100,000 to the American Academy of Pediatrics to help finance a nationwide study of child health services Dr John P Hubbard, instructor in pediatrics (on leave), Harvard Medical School, Boston, has been appointed executive director of the study under the auspices of a specially appointed committee (THE JOURNAL, February 2, p 298) The two year survey will seek detailed information on pediatric care from all hospitals, including general pediatric, maternity and special hospitals such as convalescent homes and tuberculosis sanatoriums It will also examine existing health services such as child health conferences, school health services, child guidance clinics, immunization programs and public health nursing facilities Information will be gathered from individual pediatricians, general practitioners and specialists who care for children Each community will be studied as to the number of physicians it has and essential medical procedures, such as transfusions, administration of intravenous fluids and laboratory facilities, that are available. As part of an extensive evaluation of pediatric education in this country, a study will be made of the sixty-six medical schools to determine the quantity and quality of pediatric training Dr Hubbard pointed out that the factual data collected will be used by the American Academy of Pediatrics as a basis on which recommendations or medical care programs may be made.

**Research in Psychosomatic Problems**—The American Society for Research in Psychosomatic Problems will hold its 1946 meeting at the Hotel Pennsylvania, New York, May 11-12, under the presidency of Dr Roy G Hoskins Among the speakers will be

Brigadier Gen William C Menninger M C Psychosomatic Medicine Somatization Reactions
Dr Roy R Grinker Chicago Applications of Military Experience to the Theory and Therapy of Acute Psychosomatic States
Dr M Ralph Kaufman New York Health as an Expression of Anxiety in a Combat Unit
Dr Henry H Jordan New York Lower Back Pains
Dr Samuel A Sandler Jersey City N J Camptomia, or the Functional Bent Back
Dr Jack R Ewalt Galveston Texas The Phantom Limb
Roger G Barker Ph D, Stanford University Calif The Somatopsychologic Problem
Dr Brunhilde Bruch and Irma Hewlett M S Baltimore, Psychologic Aspects of the Medical Management of Diabetes in Children
Dr Walter W Hamburger Jr Cincinnati Psychosomatic Medicine in an Army Hospital in India
Comdr Meyer A Zeligs (MC) U S N R A Psychosomatic Study of Central Angiospastic Retinopathy in Military Personnel
Dr Edward Weiss Philadelphia Psychosomatic Aspects of Fibrositis
Drs John A P Millet Harold A Abramson and Sadie H Zaidens all of New York A Psychosomatic Evaluation of the Dermatoses

At the annual dinner the speakers will be Dr Bertram D Lewin, New York, on "New Advances in Psychosomatic Investigative Techniques" and Dr Carl A L Binger, New York on 'The Epic of Bclawolff or The Slaying of the Psycho Some"

**Fellowships Available by Medical Research Fund**—The Life Insurance Medical Research Fund announces postgraduate and student research fellowships In the first classification the fellowships are open to residents of the United States and Canada who possess an M D or Ph D degree or the equivalent Holders are expected to devote full time to research For the present preference will be given to those who wish to work on fundamental problems broadly related to cardiovascular function and disease The annual stipend varies, but as a rule is between $2 500 and $3 000 Larger amounts may be granted in individual instances for special reasons Fellowships are granted for one year but may be renewed for one or two years They may begin at any time Applications for grants to be held for the academic year 1946 1947 must be received before August 1 Such applications received before May 15 will be acted on in June, those received later will be acted on in September For subsequent academic years applications must be received before January 1, action will be taken in February Student research fellowships are open to residents of the United States and Canada who have completed at least one year of medical school but who are not

experienced investigators Holders are expected to devote at least three fourths of their time to research under the direction of an experienced investigator For the present, preference will be given to those who wish to work on fundamental problems broadly related to cardiovascular function and disease Students will necessarily spend an extra year in obtaining the M D degree The annual stipend varies but as a rule is between $1,500 and $2 000 Fellowships are granted for one year They may begin at any time Applications for grants must be made by a sponsor who is normally the investigator under whom the applicant will work Applications for grants to be held in the academic year 1946 1947 must be received before August 1 Such applications received before May 15 will be acted on in June, those received later will be acted on in September For subsequent academic years applications must be received before April 15 action will be taken in June Further information may be obtained from Dr Francis R Dieuaide scientific director Life Insurance Medical Research Fund 333 Cedar Street New Haven 11, Conn

**College of Physicians**—The twenty seventh session of the American College of Physicians will be held at the Convention Hall Philadelphia May 13 17, under the presidency of Dr Ernest E Irons Chicago Among the speakers will be

Drs George D Gammon and John H Stokes Philadelphia Penicillin in Neurosyphilis
Dr Roger I Lee Boston Geriatrics
Dr Edward Weiss Philadelphia Psychogenic Rheumatism
Dr Lester R Dragstedt Chicago Section of the Vagus Nerves to the Stomach in the Treatment of Peptic Ulcer
Drs Henry J Tumen James F Monaghan and Emil Jobb all of Philadelphia Hepatic Cirrhosis as a Complication of Ulcerative Colitis
Dr Edwin B Astwood Boston Use of Thiouracil in Hyperthyroidism
Dr Arthur L Watkins Boston Prescription of Physical Medicine by the Internist
Dr Francis G Blake New Haven Conn Tsutsugamushi Disease (Scrub Typhus) A Review of Recent Observations
Drs Ramon M Suarez San Juan P R Tom D Spies Cincinnati and Birmingham Ala and Ramon M Suarez Jr San Juan P R The Use of Folic Acid in Sprue
Drs Thomas Francis Jr and Jonas E Salk both of Ann Arbor Immunization Against Influenza

Morning lectures will be given on blood banks and storage of blood, the management of renal dysfunction nitrogen metabolism in chronic disease liver function in hepatitis schistosomiasis diverticula of the gastrointestinal tract coronary artery disease in 18 39 year age group and peripheral vascular disease There will be panel discussions on antibiotic therapy treatment of thyroid disease treatment of liver disease tropical medicine in general practice, medical viewpoints of cardiovascular surgery treatment of syphilis electrocardiography treatment of peptic ulcer treatment of hypertension diabetes allergy, peripheral vascular disease arthritis hematology blood transfusion and blood substitutes and vitamins The program also will include clinics at the various local hospitals and a symposium on plasma fractions

**Society of American Bacteriologists**—The forty-sixth general meeting of the Society of American Bacteriologists will be held at the Book Cadillac Hotel Detroit May 21-24 under the presidency of Dr James Craigie Toronto Canada and under the sponsorship of the Michigan branch of the society The first session will be devoted to the teaching of bacteriology at the graduate and professional levels with the following speakers

*William Burrows Ph D Chicago Basic Training in Bacteriology*
Dr Walter J Nungester Ann Arbor Bacteriologic Training for Professional Students
J Howard Meuller Ph D Boston Graduate Training in Bacteriology
Dr Francis B Gordon Chicago The Teaching of Viral and Rickettsial Diseases
Dr Donald S Martin Durham N C The Teaching of Mycology as a Part of Medical Bacteriology
Harry E Morton Sc D Philadelphia Enlivening and Clarifying the Instruction in Bacteriology by the Use of Audiovisual Aids

Among the numerous speakers on the general program are

Guy P Youmans Ph D Chicago and William H Feldman D V M Rochester Minn The Sensitivity of Tubercle Bacilli in Vitro to Streptomycin
Albert Kelner Philadelphia A Survey of Antibiotic Production by Representative Aspergilli Penicillia and Other Fungi from a Culture Collection
Miriam O Lipman A M James A. Coss M S and Ralph H Boots all of New York Changes in the Bacterial Flora of the Throat and Intestinal Tract During Prolonged Oral Administration of Penicillin
Robert M Pike Ph D Dallas Mucoid Polysaccharide Production Encapsulation and Colony Morphology of Carrier Strains of Group A Streptococci
John H Hanks Ph D Culion Philippines The Fate of Leprosy Bacilli in Tissues Cultivated from Leprous Lesions
Dr Charles A Evans Minneapolis, Intraocular Infection with the Viruses of Ornithosis and Feline Enteritis
Dr Charles F Pait Jr John F Kessel Ph D and Philip Grossman all of Los Angeles The Neutralization of the Mouse Adapted Poliomyelitis Virus by the Serums of Children
Isabel M Morgan Ph D Baltimore Allergic Encephalomyelitis in Monkeys in Response to Injection of Normal Monkey Cord
*Elizabeth W St John S D and Dr Francis B Gordon*, both of Chicago Studies on Antigenic Relationships Within the Psittacosis Lymphogranuloma Group of Viruses
MacDonald Fulton Ph D and Martha L Chilton both of Galveston Texas The Classification of Paracolon Bacilli Isolated from Man
Drs Sara E Branham and Karl Habel both of Bethesda Md Preparation and Evaluation of an Irradiated Toxoid from the Toxin of Shigella Dysenteriae
Albert Milzer Ph D and Dr Sidney O Levinson both of Chicago Production of Potent Inactivated Vaccines with Ultraviolet Irradiation V Active and Passive Immunization with Lymphocytic Choriomeningitis Vaccine
Dr Paul R Cannon Chicago Immunologic Aspects of Protein Metabolism
Joseph Hejna B S and Dr Leslie R Hedrick, Ph D both of Chicago Effect of Growth of Micro Organisms on Formation of Peroxid Free Fatty Acids Aldehydes and Ketones from Oils with Different Iodine Numbers
Reuben L Kahn Sc D Ann Arbor Studies on Biologically Universal Serum Reactions (Nonsyphilitic) with Liquid Antigens
Selman A Waksman Ph D Walton B Geiger I h D and S R Green all of New Brunswick N J The Inactivation of Streptomycin and its Practical Applications
Alexander Hollaender Ph D Bethesda Md The Use of Ultraviolet Radiation in Air Disinfection

**Support for National Science Foundation Bill**—On April 16 the Committee Supporting the Bush Report sent an appeal to Congress to enact S 1850 the National Science Foundation Bill, known as the Kilgore-Magnuson bill The appeal is on behalf of the 5 000 scientists and others who signed or endorsed a letter sent to the President dated Nov 24 1945 and reads as follows

For the reasons stated in the Bush Report and in the Report on Science Legislation of the Committee on Military Affairs we are in favor of Federal support for scientific research and education We are in favor of a National Science Foundation We are satisfied that given appointments *by the President to the National Science Board solely on the* basis of demonstrated capacity and fitness the Foundation described in S 1850 will promote and protect the interests of science and will thus serve the public welfare

While S 1850 is a compromise it is a compromise on which most scientists have agreed Most of the principles for which this Committee has consistently stood have been accepted Thus there is provision for a strong National Science Board Though the Administrator will be appointed by the President the President must consult with and receive the recommendations of the National Science Board concerning the appointment And the Administrator must consult and advise with the Board *on* all matters of major policy program or budget The Board has the power to make recommendations to the President and to the Congress independently of the Administrator The advice and approval of the Board are required for appointment to the Divisional Scientific Committees the chairmen of which will serve as members of the Board Except in the case of National Defense there is no provision for *ex officio* appointments either to the Board or to the Divisional Committees The Foundation will be endowed with powers sufficient to initiate and carry out an effective program in aid of scientific research and education

In endorsing S 1850 and appealing for its prompt enactment we recognize that many scientists doubt the wisdom of (a) the inclusion of the social sciences in *this* legislation (b) the provisions affecting the Government s patent policy, and (c) the arrangement for mandatory geographical distribution of funds to state supported and land grant colleges While many would be better satisfied if these provisions were dropped from the legislation we should regard protracted delay or failure to enact this legislation would be far more prejudicial to the public interest than the inclusion of the provisions objected to

We believe that the creation of a National Science Foundation to support fundamental scientific research and the education of scientists is of the utmost importance for the health security and welfare of the nation Moved by this conviction and recognizing the public responsibility of men of science in these matters we have to the full extent of our ability, endeavored to aid the Congress in the formulation of workable legislation Believing the matter to be of great urgency we recently joined with other non partisan groups in an appeal to the Chairman and members of the Senate Committee on Military Affairs to report a bill on which the majority of scientists could agree S 1850 is the result. We endorse this bill and appeal now to the Congress as a whole to create a National Science Foundation by the enactment of S 1850 before the end of the present session

Members of the committee include

Roger Adams Ph.D Urbana Ill
William P Anslow Jr Ph D New York
Boris A Bakhmeteff D E New York
George W Beadle Ph D Stanford University Calif
Dr Francis G Blake New Haven Conn
Isaiah Bowman L L D Baltimore
Detlev W Bronk Ph D Philadelphia

Dr Walter W Palmer New York
Linus C Pauling Ph D Pasadena Calif
Alfred N Richards Sc D Philadelphia
Dr Homer W Smith Rochester N Y
Dr James J Waring Denver
Bethuel M Webster New York
Dr Lewis H Weed Baltimore

# Deaths

**Waid Edwin Carson** ⊕ Pittsburgh Johns Hopkins University School of Medicine Baltimore 1907, professor of ophthalmology at the University of Pittsburgh School of Medicine specialist certified by the American Board of Ophthalmology member of the American Academy of Ophthalmology and Otolaryngology Pittsburgh Academy of Medicine the Pittsburgh Ophthalmological Society and the Association for Research in Ophthalmology fellow of the American College of Surgeons served in the U S Naval Reserve during World War I on the staffs of Western Pennsylvania Hospital Eye and Ear Hospital Magee Hospital and the Presbyterian Hospital where he died April 10 aged 69 of heart disease

**Gerhard A Bading,** Milwaukee Rush Medical College Chicago, 1896 born in 1870 formerly on the faculties of the old Milwaukee Medical College and the Wisconsin College of Physicians and Surgeons and regent at the Marquette University served during World War I health commissioner from 1906 to 1910 at one time mayor, for many years United States minister to Ecuador formerly attending surgeon at the Johnston Emergency Hospital and consulting surgeon at the Milwaukee County Hospital served as resident physician at the Milwaukee Hospital where he died April 11, aged 75

**John Howard Acheson,** New York, University of Buffalo School of Medicine 1900 member of the American Medical Association served during World War I, formerly affiliated with the Manhattan Eye and Ear Hospital and the New York Polyclinic Medical School and Hospital died at his home in New Rochelle January 18 aged 70 of pulmonary embolism

**Rocco Marcus Antonelli,** Youngstown, Ohio Eclectic Medical College Cincinnati 1919, died in the Southside unit of the Youngstown Hospital January 2, aged 57 of cerebral embolism and cardiac fibrillation

**Russell S Beam,** Lumberton N C Jefferson Medical College of Philadelphia 1912 born in 1887, member of the American Medical Association fellow of the American College of Surgeons specialist certified by the American Board of Otolaryngology served in France during World War I, chief of the eye, ear nose and throat department Thompson Memorial Hospital served on boards of several state institutions president of the National Bank of Lumberton, died January 9 aged 58 of coronary thrombosis

**Charles Howard Bellamy,** Dallas Texas Physio Medical College of Indiana Indianapolis 1897 member of the American Medical Association on the staffs of the Baylor University Hospital and St. Paul's Hospital where he died January 9 aged 72, of coronary occlusion

**Martin W Bisson** ⊕ Charleston Ill Chicago Homeopathic Medical College 1902 past president of the Coles Cumberland Counties Medical Society on the staff of the M A Montgomery Memorial Sanitarium killed January 1 aged 68 when the automobile in which he was driving was struck by a train

**Barton Brewer Bridge,** Albert City Iowa Queen's University Faculty of Medicine Kingston Ont Canada 1900 past president of the Buena Vista County Medical Society, life member of the Iowa State Medical Society served as local town health officer and member of the school board died in Storm Lake December 23 aged 74, of cerebral hemorrhage following an automobile accident

**John I Brockbank,** Du Bois Pa Baltimore University School of Medicine 1886 member of the American Medical Association twice elected county coroner for eighteen years health officer of Du Bois and member of the school board charter member of the city public library commission on the staff of the Du Bois Hospital where he died January 9 aged 87 of anemia and arteriosclerosis

**Elmer E Burns,** Kirby Ohio Columbus Medical College 1890 served as mayor of Kirby and member of the board of education died in the McKittrick Hospital, Kenton, January 6, aged 80 of hernia

**Oscar Piece Chapman,** Port Royal Ky Hospital College of Medicine Louisville, 1902 member of the American Medical Association president of the Henry County Medical Society served during World War I, died in the U S Marine Hospital Louisville, January 8 aged 71 of cerebral hemorrhage

**Josiah Coborn** ⊕ Hopewell Junction, N Y McGill University Faculty of Medicine Montreal, Que, Canada 1907 served as health officer of the towns of East Fishkill and Beekman on the staff of the Vassar Brothers Hospital, where he died January 7, aged 68 of cerebral thrombosis

**James Bronson Conant,** Amsterdam, N Y Columbia University College of Physicians and Surgeons, New York, 1896 member of the American Medical Association, fellow of the American College of Surgeons, served as county coroner, past president of the staff of the Amsterdam City Hospital, on the staff of St Mary's Hospital, died January 5, aged 75, of cerebral hemorrhage

**Isaac Fory Crosby,** Pasadena, Calif College of Physicians and Surgeons of Chicago, 1889 member of the American Medical Association, past president of the Southwestern Iowa Medical Association member of the American Association of Railroad Surgeons, for many years surgeon for the Rock Island Railroad died December 19, aged 81 of bronchopneumonia, cerebral thrombosis and Parkinson's disease

**Howard Irving Davenport,** Auburn, N Y , Johns Hopkins University School of Medicine, Baltimore, 1905, member of the American Medical Association, past president of the Cayuga County Medical Society, associated with the Cayuga County Laboratory on the staffs of the Mercy Hospital and the Auburn City Hospital, where he died January 9, aged 67, of coronary occlusion

**Louis Belfair Derdiger,** Minneapolis, Maryland Medical College, Baltimore 1909 College of Physicians and Surgeons of Chicago School of Medicine of the University of Illinois, 1910 formerly affiliated with the Veterans Administration Facility died January 4, aged 58 of myocardial and renal insufficiency

**Gustave Adolf Everson** ⊕ Rolfe Iowa, State University of Iowa College of Medicine, Iowa City 1910, secretary of the Pocahontas County Medical Society, died January 6, aged 61, of coronary occlusion

**James Henry Flynn,** Troy, N Y Albany Medical College, 1899, member of the American Medical Association for many years health commissioner, past president of the Rensselaer County Medical Society, served as president and vice president of the New York State Health Officers Association on the staffs of the Leonard Troy and Samaritan hospitals, died January 9, aged 72 of coronary thrombosis

**Louis Bernard Goldberger,** New York Long Island College Hospital Brooklyn 1910 member of the American Medical Association on the staffs of the Community and Lincoln hospitals, died December 2, aged 56 of coronary disease

**Ernest Flint Green,** Seal Beach, Calif Gross Medical College Denver 1895, died December 31, aged 75, of cerebral hemorrhage and hypertension

**Alys Abigail Bixby Griff,** Portland, Ore University of Oregon Medical School Portland, 1902 died January 2, aged 65 of cardiorenal disease

**Henry Young Harper,** Oakhill, Ala , University of Louisville School of Medicine, 1933, began active duty as a first lieutenant in the medical corps, Army of the United States, in August 1942 relieved from active duty in January 1944, died in Birmingham January 13, aged 37

**Ernest Samuel Heilman** ⊕ Ida Grove Iowa College of Physicians and Surgeons of Chicago School of Medicine of the University of Illinois, 1901, died January 8 aged 66, of cerebral hemorrhage

**John Carroll Johnson,** Hamilton Ala Hospital College of Medicine, Louisville 1892 member of the American Medical Association, served as county health officer died in Louisville, Ky January 3 aged 84, of chronic interstitial nephritis

**Lewis C Jones,** Madison Station, Miss Louisville (Ky) Medical College 1886, died December 29, aged 84, of arthritis

**Grant M Kistler,** Lansford, Pa Hahnemann Medical College and Hospital of Philadelphia, 1889, last surviving member of the original board of directors of the Citizens National Bank, serving as its president for many years, died in the Coaldale State Hospital Coaldale, January 3, aged 80, of strangulated inguinal hernia

**Richard Maury Leake** ⊕ Laramie, Wyo , Memphis (Tenn) Hospital Medical College, 1901, served as health officer of Albany County, died in Denver, January 7, aged 67, of coronary occlusion

**Clarence Long,** Hurtsboro Ala , Chattanooga Medical College, 1901 member of the American Medical Association, died in the City Hospital, Columbus, Ga , December 13, aged 70, of heart disease

**Joseph Francis Long,** Brooklyn, Long Island College Hospital, Brooklyn 1895, served overseas during World War I and on the staffs of the Kings County and Brooklyn hospitals, died January 4, aged 71, of coronary embolism

**Francis McConaughy,** Somerville N J , New York Homeopathic Medical College and Hospital New York 1890, member of the American Medical Association past president of the Somerset County Medical Society on the staff of the Somerset Hospital died in Ridgewood January 13, aged 82, of chronic myocarditis

**Carl Ray McFarland,** Long Beach Calif Ensworth Medical College St Joseph Mo 1905, died in Pomona December 10 aged 65 of lateral sclerosis

**Edwin Bruce McKay,** Detroit, Detroit College of Medicine 1896, on the auxiliary staff of the Grace Hospital where he died January 17, aged 75 of hypertensive cardiovascular disease

**Gerald Stone McShane** ⊕ Spring Valley Ill Loyola University School of Medicine Chicago 1921 served during World War I at one time secretary treasurer of the Bureau County Medical Society, formerly chief medical director at the Green River Ordnance Plant, Dixon, formerly on the staff of St Margaret's Hospital, died January 11 aged 52, of coronary occlusion

**Virgil Elwood Massey** ⊕ Huntingdon Tenn , Vanderbilt University School of Medicine Nashville 1914 past president of the Tri County Medical Association and the West Tennessee Medical and Surgical Association alderman of the town of Huntingdon served overseas during World War I formerly member of the school board at one time affiliated with the Knoxville (Tenn) General Hospital past president of the Lions Club died January 13, aged 54 of coronary thrombosis

**Michael Bernard Milan,** Providence R I Bellevue Hospital Medical College New York 1892, member of the American Medical Association died January 20 aged 83 of arteriosclerosis

**Warren Jacob Miller,** Miami Fla Jefferson Medical College of Philadelphia 1901 at one time a medical missionary died in the Miami Retreat January 16 aged 75, of arteriosclerosis

**Andrew J Montgomery,** Resaca Ga Atlanta Medical College, 1897, died January 3 aged 73 of heart disease

**Felix Moraux,** Green Bay Wis Wisconsin College of Physicians and Surgeons Milwaukee 1898 died in St Mary's Hospital January 29 aged 71 of coronary occlusion

**Leroy Morris Jr,** Trenton N J , Howard University College of Medicine Washington D C 1925 served during World War I died in the Jersey City Medical Center January 8 aged 49 of carcinoma of the stomach

**Stanley Clifford Mulholland,** Santa Barbara Calif University of Minnesota Medical School Minneapolis 1923 member of the American Medical Association on the staffs of St Francis Hospital and the Cottage Hospital where he died March 4 aged 52 of malignant hypertension

**Julius Noerdlinger,** Chicago Julius-Maximilians-Universität Medizinische Fakultat Wurzburg Bavaria Germany 1915, interned at the Michael Reese Hospital died suddenly January 20 aged 56 of coronary occlusion.

**William Frederick Nolting,** Brooklyn Long Island College Hospital Brooklyn 1895 member of the American Medical Association served on the local draft board during World War I died January 25, aged 77 of arteriosclerosis

**William Scott Payne** Des Moines Rush Medical College Chicago 1889 died recently aged 83 of prostatic hypertrophy

**Alfred Potter** ⊕ Brooklyn, Long Island College Hospital Brooklyn 1902 emeritus professor of dermatology at his alma mater specialist certified by the American Board of Dermatology and Syphilology consulting dermatologist, Mary Immaculate Hospital, Jamaica Long Island College Kings County Norwegian, Swedish Lutheran Brooklyn Eye and Ear St Giles and Brooklyn State hospitals found dead December 27 aged 65

**Richard Otis Preston,** Topeka Kan Kansas Medical College Medical Department of Washburn College 1911 served during World War I, died December 30 aged 60 of coronary thrombosis

**Alva C Puckett,** Fairfield Ill Physio Medical College, Cincinnati 1880 died January 29 aged 93 of influenza

**Samuel Elmer Ralston,** Harlingen Texas Jefferson Medical College of Philadelphia 1889 died January 2 aged 83 of left ventricular failure

**Samuel Thompson Redgrave Revell** ⊕ Louisville Ga. University of Maryland School of Medicine Baltimore, 1905 past president of the Jefferson County Medical Society and the Sixth District Medical Society past vice president of the Medical Association of Georgia served during World War I died January 13 aged 65 of carcinomatosis

**Daniel W Relihan,** Smith Center Kan Rush Medical College, Chicago 1896 honorary member of the Kansas Medical Society member of the American Medical Association one of the original organizers charter member and past president of the Smith County Medical Society formerly county health officer served as United States examining surgeon Bureau of Pensions, died January 6 aged 91 of adenocarcinoma of the liver

**Eli Vestal Rice,** Polo Ill Kentucky School of Medicine, Louisville 1894, Hospital College of Medicine Louisville 1896, died in Sterling December 23, aged 86 of arteriosclerosis

**Edwin Rinear,** Traverse City Mich Medical College of Ohio, Cincinnati 1890 member of the American Medical Association in March 1922 joined the staff of the Traverse City State Hospital, where he served continuously until his retirement on Sept 30 1943 at which time he held the position of senior physician died in Mount Dora, Fla January 14, aged 79 of arteriosclerotic heart disease

**Albert W Rye,** Russellville Ark , Memphis (Tenn) Hospital Medical College 1900 died in St Mary's Hospital in December aged 70 of pneumonia

**Orris William Saunders** ⊕ Camden N J Jefferson Medical College of Philadelphia 1898 past president of the Camden County Medical Association served as city councilman coroner, county physician and member of the board of managers of the Camden County Tuberculosis Hospital Grenloch died January 13 in the Cooper Hospital aged 69 of virus pneumonia.

**John Curtis Sayers** ⊕ Reynoldsville Pa Medical Department of the Western University of Pennsylvania Pittsburgh, 1897, president of the school board and board of health, health officer formerly county coroner on the staff of the Maple Avenue Hospital Du Bois and the Adrian Hospital Punxsutawney, died December 31 aged 73 of coronary occlusion

**Arthur William Shaleen** ⊕ Hallock Minn University of Minnesota College of Medicine and Surgery Minneapolis 1902 served during World War I affiliated with the Kittson War Veterans Memorial Hospital died January 6 aged 67 of coronary thrombosis diabetes mellitus and hypertensive heart disease

**Martin Edward Staudenmayer,** Leachville Ark Georgia College of Eclectic Medicine and Surgery Atlanta 1914 died December 20 aged 60 of heart disease

**George Reimensnyder Teitsworth** ⊕ Kingston Pa Temple University School of Medicine, Philadelphia 1932 interned at the Wilkes-Barre General Hospital in Wilkes-Barre served a residency at the Hazleton State Hospital in Hazleton died December 31 aged 39 of acute cardiac failure

**George Hoy Tibbins,** Beech Creek, Pa Jefferson Medical College of Philadelphia 1890 member of the American Medical Association served during World War I died December 13 aged 77 of cerebral hemorrhage

**Eugene Wallace,** Norwich Kan College of Physicians and Surgeons of Chicago School of Medicine of the University of Illinois 1905 member of the American Medical Association owner and medical director of the Norwich Hospital, died January 10 aged 66 of coronary thrombosis

**Marcus Aurelius Weems** ⊕ East Columbia Texas University of Pennsylvania Department of Medicine, Philadelphia, 1890 died January 3 aged 78 of carcinoma of the prostate

**John Albert Welborn,** Glendale, Calif California Medical College San Francisco 1897 died in a local hospital December 27 aged 77

**Gottlieb Werley** ⊕ El Paso Texas Columbian University Medical Department Washington D C 1894 died December 27 aged 80 of generalized arteriosclerosis

**Thomas Dallas White** Orrstown Pa Medico Chirurgical College of Philadelphia 1893 member of the American Medical Association died December 16 aged 73, of coronary occlusion.

**Arthur Raymond Wilson,** Ingomar Pa University of Pennsylvania Department of Medicine Philadelphia 1892 died December 14 aged 81 of bronchopneumonia and arteriosclerosis

**John Samuel Wilson** ⊕ Monticello Ark University of Arkansas School of Medicine Little Rock 1913 specialist certified by the American Board of Radiology Inc , past president and secretary of the Drew County Medical Society, member of the Radiological Society of North America Inc., and the American College of Radiology secretary of the Arkansas Radiological Society served in France during World War I on the staff of the Mack Wilson Hospital where he died January 7 aged 66 of cerebral hemorrhage

**Charles William Yeck,** Pawnee Ill University of Louisville Medical Department, 1891 died in a hospital at Peoria January 15, aged 78 of cardiac decompensation

# DIED WHILE IN MILITARY SERVICE

**Morris Horn** ⊕ New York Fordham University School of Medicine, New York, 1921, interned at the Jersey City Hospital served on the staffs of Beth David Hospital and the Hospital for Joint Diseases and physician to the Columbia Grammar School for Boys began active duty as a captain in the medical corps, Army of the United States on July 14 1943 died in France, Dec. 9, 1945 aged 45, of coronary thrombosis

**Charles Frederic LeComte** ⊕ Passed Assistant Surgeon Lieutenant U S Navy, Madison Wis University of Oregon Medical School, Portland, 1932 U S Naval Medical School 1938 entered the U S Navy as a lieutenant (jg) on Aug 17, 1936 promoted to lieutenant interned at the Multnomah Hospital in Portland Ore died in Fukuoka Prison Camp in Japan Feb 3, 1945, aged 37, of acute enteritis

**George Maurice Lichtenstein,** Philadelphia, Temple University School of Medicine, Philadelphia 1936, interned at St. Joseph's Hospital began active duty as a first lieutenant in the medical corps, Army of the United States, on Dec. 5, 1940, promoted to captain, died Dec. 20, 1945, aged 32, of sarcoma

**William George McKay** ⊕ Colonel, M C U S Army Washington, D C Rush Medical College, Chicago, 1910, U S Army Medical School, 1922, served during World War I entered the medical corps of the regular army in 1920, died in the Brooke General Hospital Fort Sam Houston, Texas July 15 1943, aged 62, of carcinoma of the bladder

**William Henry Mathews,** Rochester N Y Harvard Medical School Boston, 1936 interned at the Strong Memorial and Rochester Municipal Hospitals where he served a residency, began active duty as a lieutenant (jg) in the medical corps of the U S Naval Reserve on Feb 7 1942, promoted to lieutenant and lieutenant commander, died on the U S S *Nashville* Dec. 13 1944 aged 33, following traumatic amputation of the lower extremities

**Walter Mauthe,** Whitefish Bay, Wis Marquette University School of Medicine Milwaukee, 1932 interned at St Mary's Hospital in Milwaukee, began active duty as a lieutenant in the medical corps of the U S Naval Reserve on Oct. 12, 1942 stationed for twenty-five months in the New Hebrides Islands as medical officer of a Seabee detachment promoted to lieutenant commander, died Nov 19 1945, aged 37, of coronary thrombosis

**Thomas White Meriwether,** Doddsville, Miss , University of Tennessee College of Medicine, Memphis, 1934 member of the American Medical Association, began active duty as a first lieutenant in the medical corps, Army of the United States, on March 9 1944, promoted to captain, went overseas in January 1945, served in three battles on Okinawa died in Seoul, Korea, Nov 24, 1945, aged 32, of spinal meningitis

**Louis Michaels** ⊕ Brooklyn, Friedrich-Wilhelms-Universität Medizinische Fakultät, Berlin Prussia Germany, 1935 served as assistant physician at the Unity Hospital began active duty as a first lieutenant in the medical corps Army of the United States in October 1942, promoted to captain, served in the medical gas division and lectured in England on the treatment of gas casualties, went to France shortly after the invasion and headed a surgical team in the Bastogne Bulge Battle won the Bronze Star died at Camp Upton, L I, Oct. 11 1945, aged 37

**Charles Marion Musso Jr,** Washington D C, Georgetown University School of Medicine, Washington, D C, 1935 served an internship and residency at the Georgetown University Hospital, diplomate of the National Board of Medical Examiners began active duty as a captain in the medical corps, Army of the United States (National Guard) on Feb 3, 1941, promoted to major, died in Mutzig France, Dec. 24, 1944, aged 37

**Francis Harold Needle,** Pontiac Mich , Wayne University College of Medicine Detroit, 1939 interned at the Highland Park (Mich) General Hospital served a residency at the Pontiac General Hospital, member of the American Medical Association, lieutenant, medical corps, U S Naval Reserve, stationed in the Aleutian Islands for eighteen months, sent to Texas for eight months before heading for the South Pacific in October 1944, killed in the Pacific area July 27 1945, aged 36, in a plane crash while serving as a flight surgeon with a rescue squadron.

**Vincent Carol Olshefski,** Mount Carmel Pa., Hahnemann Medical College and Hospital of Philadelphia 1939, member of the American Medical Association, interned at the Pottsville Hospital in Pottsville, began active duty as a lieutenant (jg) in the medical corps U S Naval Reserve, on Aug 12, 1942 promoted to lieutenant, served five months in the Pacific theater of war later navy physician for the V-12 unit at Bloomsburg State Teachers College, returned for reassignment in Norfolk, Va , where he died in the U S Naval Hospital, Sept. 2, 1945, aged 31 of acute myocarditis

**Joseph David Picciotti,** Rochester, N Y , Harvard Medical School Boston, 1928, member of the American Medical Association interned at St Mary's Hospital in Rochester began active duty as a lieutenant commander in the medical corps of the U S Naval Reserve on Jan. 18 1943 died in Cavite P I, Aug 29, 1945 aged 42

**William J Long Porcher** ⊕ Lieutenant Colonel, M C, U S Army, New York University of Minnesota Medical School Minneapolis, 1933, U S Army Medical School in 1937 interned at the City of Detroit Receiving Hospital in Detroit and University Hospital in Minneapolis, served a residency at the Northern Pacific Beneficial Association Hospital in St Paul, entered the medical corps of the regular army in 1936, died in England, Nov 24 1944 aged 35 of coronary occlusion

**Richard Martin Riley,** Albuquerque, N M , Northwestern University Medical School Chicago, 1935, member of the American Medical Association, interned at the Mercy Hospital in Chicago, began active duty as a captain in the medical corps Army of the United States National Guard on Jan 3, 1941, promoted to major died in the Southwest Pacific area July 9, 1943 aged 34, of amebic dysentery

**Jack Percy Scott** ⊕ Lieutenant Colonel M C U S Army Galveston, Texas, University of Texas School of Medicine, Galveston, 1935 entered the medical corps of the U S Army as a first lieutenant in May 1938, promoted through the various grades to that of lieutenant colonel, died near Ledo, India, March 4, 1945 aged 35, in an airplane crash

**Richard Edward Shea,** Willimantic, Conn., Yale University School of Medicine, New Haven, 1930 born in Willimantic Sept 28, 1906, member of the American Medical Association, interned at the Grace Hospital in New Haven and a residency at the Hartford Hospital in Hartford began active duty as a first lieutenant in the medical corps, Army of the United States on June 4 1943, served twenty-two months with the Army Air Force in India and Okinawa, where he was successively promoted to captain and major recently returned to the United States formerly affiliated with the Windham Community Memorial Hospital where he died Nov 6 1945, aged 39

**Irving Isadore Shure,** Bethel N C , Medical College of Virginia, Richmond, 1933, interned at the Trinity Hospital in Brooklyn, served a residency at the Beth Israel Hospital in Boston major, medical corps, Army of the United States, died near Port Patrick, Scotland, July 27, 1944 aged 35 in an airplane crash

**Barnett Solovioff,** New York, Marquette University School of Medicine, Milwaukee, 1942, diplomate of the National Board of Medical Examiners, interned at the Jewish Hospital in Brooklyn, began active duty as a first lieutenant in the medical corps, Army of the United States on Feb 17, 1943, promoted to captain died in Oneida Tenn May 6, 1944, aged 28, in an aircraft accident.

**Clarence Johnson Strand,** Amherst, Neb , University of Nebraska College of Medicine, Omaha 1932 interned at the Jennie Edmundson Memorial Hospital in Council Bluffs, Iowa, major medical corps, Army of the United States, serving at Bataan, where he was captured by the Japanese, died in the Philippine Islands Oct. 8 1944, aged 40, of heat exhaustion.

### Shortage of Physicians for the National Health Service

Addressing the Insurance Institute of London, Dr Charles Hill, secretary of the British Medical Association, said that there would not be enough doctors to provide at once the full service promised by the national health bill A statistical inquiry by the British Medical Association showed that the average person insured under national health insurance called on his doctor for more than five items in the course of the year For a considerable portion of the community there would be an increase in the demand for medical service comparable with that experienced on the introduction of national health insurance, which increased threefold the calls made on doctors by those who then came into insurance Dr Hill estimated that general practitioners alone would be called on to provide some 40 million extra items of service each year The shortage of consultants was likely to be even more serious Under the new service there would be a natural tendency for the public to ask for a consultant s opinion as a right, and it would be difficult for the general practitioner to refuse in all cases Bearing in mind that for certain branches of medicine and surgery no consultants were at present available, it could be concluded that for some time the promised service could not be provided

Another question was that of certification for sick benefit. The scheme was open to the whole community and the benefits were a substantial increase on those of the present national health insurance scheme At present a married man with a wife at home and one child received $3 50 a week sickness benefit, dropping to $2 disablement benefit after twenty-six weeks Under the national insurance bill the same man would receive $10 a week with no drop in rate with time Unless the individual patient could feel that the doctor would use his genuine and unbiased judgment in signing or not signing the certificate which the patient sought, there would be a good deal of discontent

### The Postgraduate Federation

A system of postgraduate teaching has been developed in recent years in this country In 1932 the British Postgraduate School was formed in connection with the Hammersmith Hospital in London Its object was to train prospective specialists, to instruct doctors needing advanced teaching and to provide short refresher courses for general practitioners This hospital could not provide full facilities for postgraduate education or make arrangements for training in special branches of medicine This is now to be corrected The school is to be reconstituted as a federal organization under the name of the British Postgraduate Medical Federation to include the Hammersmith Hospital and various institutes in special subjects Grants are to be made to the Institutes of Laryngology and Otology, Ophthalmology, Neurology and Child Health, and later to an Institute of Dermatology Other specialist hospitals have indicated their willingness to take part, but their teaching schools have not sufficient accommodation at present for the formation of specialist institutes. However, they may be associated with the federation and used for specialist training Increased demands by students from overseas have necessitated expansion of the clinical facilities in general medicine and surgery Some of the London county hospitals and the special hospitals have offered to take additional graduate students

Advanced courses in general medicine and surgery may soon be offered to specialists who require a short period of instruction to complete their training for a higher degree. Registrarships for trainee specialists are to be established at the specialist hospitals as well as at Hammersmith It is also hoped that traveling fellowships may become a feature of the training Fortnight refresher courses for general practitioners are to be replaced later by part time clinical assistantships, monthly meetings, annual intensive courses of one week and week end courses The director of the British Postgraduate Federation is the distinguished physician and teacher Sir Francis Fraser, late director general of the Emergency Medical Service which was formed to deal with casualties and diseases in Britain during the war

### Medical Research in France Under Nazi Occupation

Despite tremendous difficulties encountered by research workers in the Nazi occupied territories, French medical research during the occupation was far from negligible However, lack of personnel, morale and materials, especially laboratory animals, has restricted medical progress in France since 1940 French physicians paid heavy tribute to the Nazis Some committed suicide, like Thierry de Martel the brain surgeon the day the Germans entered Paris, and Jacques Charles Bloch, when the Gestapo came to arrest him The surgeon Bernard Desplats and others were arrested. Many were deported, including Charles Richet, Desoille and Weiss Of many who died in Germany or a few days after their return to France were Levy-Valensi, Hamburger and Leon Kindberg Some escaped from the Gestapo but were obliged to hide such as Vallery-Radot, Debre, Etienne Bernard and Haguenau

If one remembers the worries that nearly every Frenchman had concerning deported relatives and friends, coupled with anxiety for his immediate family and his own security (arrest was likely at any moment, followed too often by reprisal shootings) and particularly the most serious worry of all—that for the fate of his country in brief, the state of mind attendent on complete uncertainty even regarding one s immediate future it is easy to understand that even scientific problems of paramount interest seemed comparatively unimportant alongside the disappearance of all moral standards and social laws

The lack of animals for experimental purposes made it impossible for physiologists and experimental pathologists to carry on their work. This was due to shortage of food and heat. Some hospital laboratories were allowed to breed guinea pigs, mice and rats, which were fed on garbage It seemed irrational at that time to use rabbits for experiments instead of eating It was almost impossible to prevent theft of the rabbits, the thieves could hardly be blamed A sport current at the time was dog and cat hunting Some investigators specialized in hunting down animals belonging to the Germans Thus some physiologic experiments could occasionally be performed. Bacteriology and microscopic pathology suffered because of the impossibility of heating the incubators, since electricity and gas were cut off at irregular hours at night and day Shortage of glass impeded chemical research somewhat.

#### MEDICAL INVESTIGATIONS DURING THE OCCUPATION

1 Observations were made on haptoglobin, which is a blood protein which activates the peroxidase function of hemoglobin in a specific manner By studying the enzyme power of hemoglobin mixed with the patient s serum on the reaction of ethyl peroxide with hydroiodic acid one may measure accurately the quantity of haptoglobin in the serum. Increase of haptoglobin occurs in all infections and is a test of the activity of infectious processes The test is more accurate than the blood sedimentation rate. It is useful in many pathologic conditions, especially pulmonary tuberculosis, in which the degree of activity of a lesion can be measured.

2 First observations of the antithyroid action of aminothiazole were made in a factory where the substance was being handled by workers who subsequently developed symptoms of goiter and myxedema. This effect was confirmed by experiments on rats and rabbits Aminothiazole has been used for the treatment of toxic diffuse goiter and apparently is far less toxic but less effective than thiourea or thiouracil Further study is necessary

3 Lavollay and Parrot have isolated a compound named epicatechol, which has effects similar to those of vitamin P in diminishing capillary fragility Studies are now in progress to evaluate the use of epicatechol for certain types of purpura and edema

4 Dr B N Halpern has made extensive studies of synthetic antihistamine compounds More than thirty substances were investigated of which two were found to have a high antihistamine potency, one was a derivative of benzylaniline and the other a salt of benzylaminopyridine

5 J Reilly has done important research on the role of the sympathetic nervous system in many conditions, particularly nephritis

6 Other interesting work includes description by Brumpt of a rapid technic of seroagglutinin test for typhoid and typhus, Debre's observations of the neuroedematous' syndrome in infants (paralysis and edema of the legs), treatment of polycythemia by Duvoir by inoculation with Ancylostoma duodenale and radiologic studies of early cancer of the stomach by Gutman

Unfortunately French physicians have had opportunity to study many deficiency diseases widely as a result of the malnutrition of the French population, such as deficiency edemas, diarrhea beriberi, scurvy and amenorrhea

### Disorders of Water Metabolism

In the *Semaine des hopitaux* de Gennes and Wallet discuss 300 cases of young women and girls who, notwithstanding the food restrictions, increased their weight by 10 to 15 Kg during a few months This exaggerated deposit of flesh was mostly spread on the legs the hips the abdomen and the breast There was a deep and hard infiltration of the skin of the cellulitis type (subcutaneous infiltration without inflammation) Vasomotor troubles appear in the extremities, which are red and cold and often show chilblains even out of the winter season The patients suffer from constipation are susceptible to cold and lose their hair their nails break. They present menstrual troubles as the menses diminish even to complete amenorrhea The main factor is the retention of water, but the process is not the same as in nutritional edema There is no edema but a cutaneous and subcutaneous hardening Contrary to nutritional edema, the amount of protein in the serum and the blood chlorides are normal The basal metabolism is also normal whereas that of nutritional edema is reduced as well as the function of the heart and the activity of kidneys as stated by Mauriac in 'Food Disequilibrium and the Pathogenicity of Edemas" De Gennes and Wallet believe that the endocrine factor is obvious in the cases under study The authors find that estrogen, even in large doses, aggravates the situation, whereas corpus luteum extract improves endocrine insufficiency from time to time but never diminishes the increase of tissue The authors admit that the abnormal endocrine state in certain women creates a condition favorable to the mechanism of water retention and that the food factor appears to be the decisive one that sets the mechanism in motion

### "Medical Days in Paris"

An annual "Medical Days' conference on recent medical progress in France and abroad will be instituted by Pasteur Vallery-Radot May 17 to 19 at the Hopital Broussais 96 Boulevard Didot Paris Speakers and their subjects will include Louis Aragon medicine of today as seen by a writer, Varangot and de Gennes, recent progress in endocrinology, May, endocrinology of the thyroid, Justin Bezançon, avitaminosis, René Gutman, early diagnosis of the cancer of the stomach, Hamburger, Milliez Fauvert, Gibert, renal pathology, Cachera, hepatic pathology, Huriez, R Martin and Lemierre, sulfonamides and penicillin Tzanck, blood transfusion and reanimation, Halpern, synthetic antihistamine, Soulie, recent discoveries in electrocardiography

### Medical Activities During and After the War

The head of the Norwegian Public Health Service, Dr Karl Evang, and many other Norwegian doctors left Norway soon after the German occupation in April 1940 and established an efficient health service abroad with centers in London, Liverpool, Newcastle, Glasgow, Cardiff, Halifax, New York and Bombay Medical care was needed not only for the Norwegian army and navy stationed abroad constantly recruited by young Norwegians escaping from Norway, but also for the merchant service with its 45 000 seamen Every seaman was provided with a personal health card on which the most important data concerning his health could be entered In 1943 a central register for all the syphilitic was established in London and in due course over 3,000 Norwegian seamen were entered in this register which, it is hoped, will be kept up to date in the future Many other measures, including the detection of tuberculosis among seamen, were introduced during the war and will be continued with the modifications rendered necessary by peacetime conditions

The Norwegian medical profession has been busily putting its house in order during and after the war Before the war the head of the Public Health Service held a subordinate position in the government, with a layman between him and the cabinet minister responsible for health affairs Dr Karl Evang is now the administrative head of the service. He has returned to Norway to face many problems one of the hardest of which is the shortage of doctors Some 100 Quisling doctors have been removed from the medical register, and many of them have been locked up The closure of the university by the Germans has delayed the education of between 250 and 300 medical students Whole districts in Norway have consequently been robbed of all medical aid, and Dr Evang has been obliged, much against his own inclinations, to exercise dictatorial powers in effecting a redistribution of the doctors in Norway By the autumn of 1945 some 60 doctors had been directed to take up such special emergency duties A few months later, thanks to the qualification of a fresh batch of medical students this situation became somewhat eased. It now appears that the least obnoxious of the Quisling doctors will be allowed to return to the fold

### The Journal of the Norwegian Medical Association

The *Tidsskrift for den norske Lægeforening* is the counterpart of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION representing the Norwegian Medical Association, which an envious trade union official once described as the most powerful trade union in the country As the mouthpiece of the great majority of the Norwegian doctors, the *Tidsskrift* was promptly appropriated by the Germans in 1940 and run as a vehicle for German propaganda by Norwegian Quisling doctors Hence this little terracotta colored fortnightly publication became odious to the medical profession, whose members could and did withhold their subscriptions but could not prevent the continued delivery of the publication to their homes When the Germans were expelled and the old staff of the journal took charge of it again, a need was felt to give it a new form. The new version of the *Tidsskrift,* still fortnightly, is a great improvement with the upper third of the cover blue, the lower two thirds white, and the format considerably enlarged, 30 by 21 cm instead of the former 21 by 15 cm

### BCG Vaccination Against Tuberculosis

Soon after the German occupation of Norway in April 1940 the tuberculosis experts in the Norwegian Public Health Service concluded that there was every prospect of a serious rise in the tuberculosis morbidity and mortality Measures to counteract this anticipated rise were discussed and in view of the favorable observations by Heimbeck, Scheel and others on BCG vaccination since its introduction in 1927 it was agreed that this vaccination should be carried out on Pirquet negative persons on a large scale In Oslo alone about 13 000 persons were thus vaccinated by the health authorities and several times this figure in the whole of Norway Dr G Hertzberg of the tuberculosis department of the Oslo Municipal Health Service recently presented a study of the influence of this vaccination on the tuberculosis morbidity and mortality in Oslo With the aid of Dr Julie Backer chief of the Norwegian Central Bureau for Statistics he presents a statistical calculation showing that when the annual tuberculosis mortality in Oslo for all persons up to the age of 50 is placed at 100, the corresponding figure for BCG vaccinated persons is about 18 This comparison is even more favorable to BCG with regard to the number of infectious cases of tuberculosis the figures being respectively 100 and 10

## MEXICO CITY

*(From Our Regular Correspondent)*

April 5, 1946

### Epidemic of Meningococcic Meningitis

An epidemic of meningococcic meningitis occurred from August 1945 until March 1946 in San Luis Potosi, a city situated in an unprotected, semidesert valley at an altitude of 6 187 feet. It has a temperate climate Dust storms are frequent all the year round The estimated population is over 100 000 inhabitants The standard of life is low The northern and southern quarters of the city are overcrowded and it is common to find families of ten and twelve members living in a single, ill ventilated adobe built room Most of the streets in the town are unpaved The water supply is insufficient and the sewerage system inadequate Nevertheless San Luis Potosi is an important industrial and commercial center

The study of the statistical data of the last five years shows that only 1 case of cerebrospinal meningitis occurred in 1940 and another in 1943 Perhaps several cases which were registered later in 1944 and in the earlier months of 1945 and diagnosed as simple meningitis were of meningococcic nature The source of the outbreak has been attributed to a 'bracero, a farmer back from the United States or a tourist who acted as carrier The curve of the outbreak is typical of an epidemic of this kind, showing a rise in November 1945 and higher in December, reaching the highest peak in January of the present year Five cases were reported during the first week of August 1945, 6 in September 21 in November and 90 in December In January 211 cases were registered in February 82 and in March 54 The total number of cases since the beginning of the epidemic up to March 31 1946 has been 470 During the last week of this month the outbreak subsided.

From a clinical point of view all types of the disease were observed from the septicemic, fatal ones to the benign atypical and abortive forms In all cases Neisseria intracellularis was found in the spinal fluid Basic treatment consisted in the intrathecal administration of 50 000 units of sodium penicillin followed by intravenous and intramuscular injections of penicillin and oral administration of sulfadiazine at a dose of 0 1 Gm per kilogram of body weight for forty eight hours The low mortality rate is believed to be due to this method of treatment.

Based on previous experience, sulfadiazine was prescribed as a preventive measure to 90 per cent of the inhabitants For the two days January 16 and 17 approximately 75 000 people received the drug Generally a dose of 0 3 to 0 4 Gm per kilogram of body weight was given by a nurse one day each week The same amount was given to adult contacts and proportional amounts to children for three consecutive days Except for 4 cases, which probably were in the incubation period of the disease, not a single case was registered among the people treated with the sulfonamide Other cases of epidemic meningitis have been reported in Guadalajara, Jalisco, in the western zone Saltillo, Coahuila and Monterrey Nueva Leon, in the northern states and in Mexico City, but fortunately they have been of sporadic character

### Studies on Scorpion Venom

Dr Efren del Pozo, professor of physiology in the Polytechnic Institute, Dr Guillermo Anguiano Landin of the School of Public Health and Hygiene and Jose Gonzalez of the National School of Biologic Sciences have been performing a series of studies with the venom of the three most poisonous scorpions in Mexico Centruroides noxius Centruroides suffusus and Centruroides limpidus from the states of Durango, Colima, Nayarit and Guerrero where they are quite abundant The action of the venom on the vasomotor system was studied in cats, rabbits and mice The workers report that the venom of these scorpions causes a rise in the blood pressure a liberation of epinephrine and bradycardia The poison does not affect the vascular reflexes when central stimuli are applied to the sciatic and vagus nerves In the first studies the authors conclude that all the effects of the scorpion venom are due to the stimulation of the preganglionic neurons of the sympathetic nervous system. Professor Anguiano carried on further observations to determine the mathematical formula of scorpion venom neutralization He states that such a poison follows a trend very much like the one followed by snake venom The trend of neutralization under the conditions of the experiment, varies according to a linear function $y = a\ (x - l) - b$ By these studies the writer attempts to derive the basis for the correct titration of antiscorpion serums

### Mexican Association of Gynecology and Obstetrics

The National Association of Gynecology and Obstetrics was recently founded The following officers have been elected president Dr Isidro Espinosa de los Reyes, secretary Dr Carlos Guerrero and treasurer, Dr Manuel Urrutia Publication of a Revista de Ginecologia y Obstetricia,' which will appear sometime during this month, was approved at the first meeting

## Marriages

JOSEPH A GRADY Wakefield Mass, to Miss Grace M McFail of Tampa, Fla., in Washington D C March 18

HAROLD S SANDHAUS, Lancaster, Pa, to Miss Helen Marion Newmark of Jamaica Estates, L. I N Y January 20

MILLARD F HUDSON Capt (MC), U S Navy to Mrs Helen O Rourke Hanson in New York February 19

WAYNE P HYATT Tazewell Tenn to Miss Louise Windham of University, Miss in Berkeley Calif March 2

H HAMILTON COOKE, San Jose, Calif to Mrs Trudy Birch George of Carievale Sask, Canada, March 6

VINCENT J SCHILLECI Bessemer, Ala, to Miss Frances Amanti of New London Conn February 28

LIONEL T SERVIS to Miss Elizabeth Knickerbocker Wetherbee, both of Milwaukee, February 2

JEHU PATTERSON COOPER III to Miss Jean Post Tompkins, both of Metuchen, N J, recently

DAVID E ROSENGARD, South Boston, Mass, to Miss Thelma Gorvers of Lynn January 19

LEONARD CHATELAIN Cut Off, La, to Miss Janet Alma Stokes of Bunkie, October 22

F JOSEPH BRINIG to Miss Nancy Elizabeth Dwyer, both of Erie Pa, February 16

## CHRONIC BRUCELLOSIS

*To the Editor* —In the February 9 issue of THE JOURNAL Henry M Benning, in his paper on 'Chronic Brucellosis," presents the totally unfounded thesis that a positive skin test to brucellergen indicates active infection with the disease This conclusion will certainly be challenged by many students in this field who feel that the intradermal test indicates only skin sensitization to a brucella antigen An unequivocal diagnosis of brucellosis is dependent on isolation of the causative organism in culture Many observers feel that a rapidly rising titer of specific agglutinins in the blood is strong presumptive evidence of active infection The mere presence of positive agglutinins in relatively low titer or of a positive skin test or of a high opsonocytophagic index is totally inadequate in establishing a definite diagnosis of the disease

The incidence of positive skin tests to various brucella antigens and of positive agglutinations for Brucella abortus, is surprisingly high among normal healthy people in many areas, and only the most sanguine observer will conclude that this high rate is an index of morbidity of chronic brucellosis For instance, 15 per cent of the healthy medical students of the University of Oregon Medical School show a positive skin test to brucellergen Over 5 per cent of all normal persons in this area show positive serum agglutinins of 1/80 or higher to Brucella abortus N B Wise (Evaluation of Brucella Opsono cytophagic Test, *Am J M Sc* **200** 521 [Oct] 1940) similarly studied a group of normal medical students at Duke University and found that 10 per cent showed positive skin tests and 20 per cent showed significantly high agglutinin titers for Brucella abortus in the blood. One must be very cautious in associating these incidental laboratory findings with chronic complaints of patients Such restraint is not shown in the numerous overzealous reports such as this one, which have appeared recently in the American literature

Dr Benning's paper illustrates the most disappointing aspect of many similar case reports of "chronic brucellosis', that is, the reliance placed on the notoriously misleading therapeutic test Patients with all sorts of chronic complaints are found to show a positive skin test for a brucella protein or to have agglutinins for the organism or a positive opsonic index and are promptly diagnosed as having chronic brucellosis The patients are then given one of the brucella antigens (vaccine, brucellin) and are reported to 'feel much better" or as "cured" These cures are then offered as proof of the original diagnosis Such *post hoc* reasoning is always open to serious question and has accounted for waves of uncritical enthusiasm for all sorts of therapeutic agents which in a large measure have retarded the advance of scientific medicine

The four protocols recorded by the author as textbook' instances of brucellosis are completely unconvincing Case 1, for instance, presents no evidence whatever of brucellosis in the data recorded other than a positive skin test and the fact that the patient felt like a million dollars' after his injections The patient admittedly had chronic gallbladder disease with recurring attacks of cholecystitis, and the attempt to explain his symptoms on the basis of brucellosis is patently redundant. The patient's gallbladder was ultimately removed No statement is made as to whether it was found to be a focus of brucella infection, but one can be certain that if it was the report certainly would have proclaimed it.

The second patient presumably recovered from symptoms of coronary artery disease following brucellin treatment! The diagnosis of brucellosis here is just as dubious as that of the coronary disease, which was apparently made on the basis of $Q_3$ $T_3$ inversion in the electrocardiogram. Such changes are often quite normal, and minor alterations in them may be due to respiratory variations in the position of the heart They are apparently presumed by Benning to be abnormal because he refers to "minor temporary improvements [sic] in $Q_3$ and $T_3$" In this case, as in the first, no valid proof of the diagnosis of brucellosis is offered other than the skin test. The other protocols are equally unconvincing and will not stand under any sort of critical analysis

At the present time we are having a brucellosis scare in this area Our 'epidemic" stems from the reports of two enthusiastic local practitioners who have supplied to the health department of the city of Portland almost all of the many hundreds of cases of brucellosis reported to that bureau in the past two years (Records of Department of Health Portland, Ore. [personal communication, Dr Thomas Meador, health officer]) Other clinicians, including all the competent internists associated with the University of Oregon Medical School, have been able to find practically no cases of brucellosis either verified or questionable. Furthermore in the University of Oregon Hospitals and Clinics we have had the opportunity of studying large numbers of patients who have been previously treated and "cured" or 'greatly improved' by injections of brucella vaccine by 'brucellosis specialists' These patients suffered recurrences of symptoms after a few months of treatment, and careful follow-up studies has revealed such maladies as carcinoma of the kidney, tuberculosis Hodgkin's disease leukemia and hyperthyroidism The large majority of them however were found to be suffering from clearcut psychoneuroses As might be expected temporary improvement in many of the psychoneurotics was usually noted for a short period following optimistic injection therapy, only to be followed by the inevitable recurrence of complaints The hypodermic needle, preferably a dull one, in the hands of a zealous clinician is a potent psychotherapeutic weapon The reported "cures' after vaccine or brucellin therapy must be interpreted in this light

There are many students of the subject who feel that chronic brucellosis in human beings is a great rarity A few incontestable cases have been reported in which the organism has been isolated from the oviduct, the gallbladder, joint fluid or the blood years after what was probably the initial infection (Evans, Alice C Studies on Chronic Brucellosis, *Pub Health Rep* **52** 1072 [Aug 6] 1937) However, any one who contends on the basis of positive skin tests that an appreciable percentage of the population is chronically ill as the result of harboring viable brucella organisms in the body certainly has the responsibility of marshaling more convincing evidence than that presented in this paper

There is clearly an urgent need for a cautious scientific approach to the whole confused problem of chronic brucellosis Dr Benning postulates for instance, with no proof whatever, that small splenic abscesses may be the focus of chronic brucellosis and then makes the astonishing statement that "possibly splenectomy should be contemplated as often as cholecystectomy" This is an alarming indication of the direction which may be followed next by enthusiastic brucellosis therapists

MORTON J GOODMAN, M D, Portland, Ore.

[In reply to this communication Dr Benning writes ]

*To the Editor* —It is of course to be expected that such criticism as that of Dr Goodman would arise, since this is at present a controversial subject Scores of letters commenting on the article have been received to date, and Dr Goodman's is the first unfavorable one

The isolation of Brucella abortus as Dr Goodman suggests is of course the ideal way to establish the diagnosis of chronic or acute brucellosis However, if the diagnosis of each case is to be made only on this basis, I feel that many cases of the disease will be overlooked In analogy, if it were still necessary to isolate the Koch bacillus in each case of tuberculosis or Treponema pallidum in each case of syphilis, treatment of many cases of these diseases during their most vulnerable phase would be omitted for the sake of absolute accuracy of records

A positive skin test to brucellergen means, as any skin test means, a reaction or conjunction of antigen and antibody It is not a question of whether the patient is infected or not but rather how, how much and when This is no place to belabor the argument that for skin sensitization a previous active infection possibly still active, must have occurred In addition to the reasons given in my article the best one being the failure of heat killed bacterins to immunize animals, I think it is interesting to take note of the fact that the brucella antigen complex is a huge molecule with a weight of about one million (Landsteiner, Karl The Specificity of Serological Reactions p 223, quoting Chargaff et al and Miles and Pirie, Cambridge Mass, Harvard University Press, 1945) Numbers of these molecules little short of virus size make up the living brucella cell If the bacterium lives it invades or is carried across the cell membrane of the host by macrophages or leukocytes and sets up infection plus antibodies If the bacterium dies the antigenic protein complex with the still large polysaccharide molecule is subject to the effects of digestive ferments and so never crosses the cell membrane Oral immunization by bacteria is extremely doubtful

Be that as it may the question of infection in skin positives finally is not qualitative but quantitative If one is surprised to find that 15 per cent of medical students of Oregon, assumed a priori to be normal and healthy, are skin positive, one need not deny the validity or the implications of the test but merely ask 'how healthy," then ask if treatment is demanded The clinician then listens to his patient's story, summarizes the physical findings and on the basis of his considered judgment, not on the basis of a positive skin test alone, he treats his patient.

Leopold Lichtwitz (Pathology and Therapy of Rheumatic Fever, New York, Grune and Stratton, 1944) has best summarized the problem when he states that "skin hypersensitivity is immunity arrested at a dangerous stage of imperfection An excellent discussion of hypersensitivity by Aikawa is found in the *Annals of Internal Medicine* (**23** 969 [Dec] 1945)

The cases will have to stand on their merits As a matter of fact patient 1, B L, though working steadily since his cholecystectomy a year ago, had a return of a few of his symptoms several months ago I make no claim to his having his brucella focus removed or to his eventual cure until he fails to react to brucellin and brucellergen

Since my paper was submitted for publication in August 1945 an interesting case of brucellosis has been reported from the Mayo Clinic (*Proc Staff Meet, Mayo Clin* **20** 455 [Nov 28] 1945) in which the spleen seems to have been the focus which maintained the active infection over a period of several months Splenectomy was finally performed, following which medical treatment apparently has produced a permanent cure. This finding lends considerable support to the idea, which so horrified Dr Goodman, that small splenic abscesses may be the focus in chronic brucellosis

Only careful clinical judgment and a wide experience with these skin positive patients will permit one to steer a course between ultraconservatism which sees no brucellosis without a positive culture, and excessive enthusiasm which requires only a positive skin test without clinical verification

H M Benning, M D, Santa Barbara, Calif

## SPRAINS IN ATHLETES AND PROCAINIZATION

*To the Editor* —I was interested in your reply in the March 9 issue of The Journal to the query of Dr D L Hollis of Biloxi, Miss, regarding the procaine injection of ankle sprains in football players

While procaine is useful in the treatment of certain minor sprains in nonathletes, the experience of this department for the past ten years, based on the treatment of approximately 75 ankle sprains a year in athletes, has led to the conclusion that it has no place in the treatment of any sprain sustained in contact sport

A sprain is a partial rupture of a ligament When the protective function of pain is eliminated by procaine and the ligament is subjected to the violent stresses and strains of football, the partial rupture might well become complete

Furthermore, it was found some years ago in a small experimental series that the contact athlete whose ankle ligaments had been anesthetized lost his sense of timing and coordination played badly and was more likely to sustain other injuries One varsity halfback, who played badly and briefly with a procainized anterior tibiofibular ligament sprain stated after return to the bench that while running he had no sense of the position of his ankle in space.

A complete exposition of this point of view regarding the diagnosis and treatment of sprains in athletes will be found in 'Athletic Injuries" by Dr Augustus Thorndike, Philadelphia Lea & Febiger, 1938

Thomas B Quigley, M D, Boston
Surgeon Harvard Athletic Association.

## AEROSOL PENICILLIN

*To the Editor* —Having read a laudatory article by H N Vermilye in The Journal, Sept 22, 1945 extolling aerosol penicillin in sinusitis and asthma, I studied this procedure in 74 cases of bronchial asthma Ages varied from 5 to 71 years the sexes being represented about equally The patients included physicians, nurses, teachers, housewives butchers, laborers and school children It was important to choose a type which I classify as asthmaticus persistans variously referred to as 'intrinsic or bacterial asthma" the intractable variety

Treatments were conducted in the patients homes under instructions from trained technicians for two to four weeks, using an oxygen tank to nebulize 20 000 units of penicillin through an attached atomizer every three to four hours

The results were strikingly disappointing, and almost with complete variance with Dr Vermilye's report. A number of patients grew worse as the result of irritation from the penicillin Some developed dermatitis and were unable to continue after two weeks' therapy Those that did continue for the full period of four weeks were divided into two groups 15 per cent who thought they may have been improved slightly and 85 per cent who were definitely not benefited. As compared with the regular procedure in bacterial allergy, such as iodides bronchodilators, sedatives vaccine therapy and general care, aerosol penicillin in its present status makes a comparatively poor showing Incidentally, oral and parenteral penicillin therapy in total doses of 500 000 to 1,000,000 units was without value in many of the cases of the asthmaticus persistans type.

My conclusion therefore at this time is that aerosol penicillin (also oral and parenteral penicillin) is of questionable value in a small percentage and of no value in the majority of cases of bacterial asthma and sinusitis

David Louis Engelsher M D, New York.

## ANNUAL CONGRESS ON MEDICAL EDUCATION AND LICENSURE

*Forty Second Annual Meeting Held in Chicago Feb 11 and 12 1946*

DR HERMAN G WEISKOTTEN, Syracuse N Y, Presiding

FEBRUARY 11—MORNING

### *IMPACTS OF THE WAR ON MEDICINE*

#### Development of High Educational Standards by the Medical Profession

DR RAY LYMAN WILBUR, Stanford University, Calif This paper appeared in THE JOURNAL, April 20 page 1055

#### Medical Progress and Medical Education During the War

DR PERRIN H LONG, Baltimore This paper appeared in THE JOURNAL, April 13, page 983

#### Medical Education in Europe

DR WILBURT C DAVISON, Durham, N C This paper was published in THE JOURNAL, April 6, page 921

#### Affiliation of Veterans' Hospitals with Medical Schools

DR PAUL B MAGNUSON Washington, D C. Less than four months ago there was announced a plan for affiliation of Veterans Administration hospitals with medical schools The plan was simple in its outlined form Basically it proposed that medicine be practiced in the Veterans Administration hospital as it is practiced in the university hospital and that medical education be coordinated so that the Veterans Administration hospital would become a postgraduate teaching unit of the university hospital group Personnel and methods of medical practice and methods of operation would be the same as those of the university group The Veterans Administration proposed to administer such a hospital and to assume its proper legislative responsibility of professional care the medical schools to assume the guidance of professional care and the operation of medical education

There have been established new part time groups of personnel for the Veterans Administration and through the medium of recommendation only by dean s committees, consisting of men of professional caliber supplied by the school locally, the proper professional qualifications are present in all personnel thereby afforded Conditions and compensation for employment are provided so that good medicine and good medical postgraduate education may be achieved by the acquisition of the highest type of personnel Residencies have been established and the conditions considerations and compensation for such employment for residents have been established to fit in each locale with the highest development of postgraduate education there present The principle of residencies to lead to specialty board qualifications has been adopted as a principle Provision is made for basic science training and the inclusion of basic science principles in the practice of medicine under the regulations of the bill that established a department of medicine and surgery

In four months we have received the acknowledgment of their willingness to cooperate of fifty of our approved medical schools This is a complete group of all those that are in near enough proximity to Veterans Administration hospitals to be applicable This affects seventy-six of our ninety-seven present hospitals and six of the seven army hospitals We expect to take over for temporary use on March 31 This affects over 60 000 Veterans Administration beds It is a stupendous job, but the cooperation of the schools and the medical profession has been constantly exhilarating

DISCUSSION OF DR LONG'S PAPER

DR C SIDNEY BURWELL, Boston In my judgment the coordination of research through the Committee on Medical Research and the other committee was a highly successful demonstration of the possibilities of coordinated research It was successful for two reasons which are important to us One is that the coordination was done by people who had first hand acquaintance with science and with investigators in their own right and, second, and the more important one, was that there were good investigators to do the research The programs that were successful were the programs that had the most successful investigators in them One of the demonstrations, it seems to me, to have come out of all this experience with research during the war is that there is no substitute for the first class man in medical research That leads me to point out the great importance of trying to keep from having a lost generation in medical research For six years almost no individual has had an opportunity to prepare himself for a life of teaching and investigation in medicine I think one of the major responsibilities of medical schools now, this moment, is to try to find in the men coming back from army and navy service the men with the kind of ability that can be developed into research ability and, having found it, to give them an opportunity not to do research for profit but to develop in themselves the capacity to go on I know of nothing that is more important to the long distance future of medicine than an attempt to restore what is now a sad lack of experienced people for academic medicine Dr Magnuson referred to a principle in medical education which perhaps he will permit me to restate. The representatives of the three schools in Boston that were discussing the formation of the dean s committee there were troubled by an implication in one of the earlier publications of the Veterans Administration that there was a separate responsibility for the teaching of residents and for the carrying on of clinical work and pointed out to Dr Magnuson their belief that there was a misconception in the idea that the training of residents could be dissociated from the carrying on of the clinical work in the hospital, because we pointed out that the most important influence in the training of residents is the quality of clinical work that is carried on in the hospital That goes not only for residents but for medical students and for men who are learning to do research

DISCUSSION OF DR DAVISON'S PAPER

DR. WILLIAM S MIDDLETON, Madison, Wis The deterioration of medical education and of medical practice in Germany was recognized, if not completely evaluated, before the invasion of Europe In the years of the activity of the Nazi ideology there had been a sacrifice of a considerable segment of the productive scholarship of these universities Furthermore, there had been an abbreviation of the medical course so that during the war one came to a period when the medical students attended nine to ten lectures or series of lectures of three months each, as opposed to the six months term of the prewar period—two and one half years of medical exposure largely on the benches as Dr Davison has pointed out. There then came a year of field service, and this field service was in the line, when the graduate served as a noncommissioned officer He thereafter was eligible for his rank of officer In this particular development apparently all medical advance in the area about and outside Germany was lost sight of The circumstance of level of practice could be judged on the basis of performance of the protected personnel that came to our lines, who were then given the responsibility for the care of the German prisoners of war The fact that they knew nothing about penicillin might have been anticipated They also had a very limited idea of the general principles of medicine In all my contact with these many installations there were only two that performed on a level that might be comparable to our mediocre hospitals in the European theater of operations These two were derived from the faculty of the University of Strasbourg It is quite apparent that the wide general principles of preventive medicine had not permeated the German army or high command The incidence of clinical diphtheria was extremely high There were

actual outbreaks of dysentery and typhus in their midst, and then the singular contrasting or controlled experiment they gave us in the incidence of tetanus in their unprotected troops Only the Luftwaffe and certain elements of the paratroops had received tetanus toxoid protection In the protected American forces there was but one instance and that a fatal one, among the protected soldiers, protected through the medium of tetanus toxoid The obvious answer is that they had not followed medical progress They had sowed the men and reaped the world I have been very much interested in the attitude toward medical education in France I was included in a group discussing with the dean's committee the advantages of graduate exposures in America The members of the committee were interested in the number of exposures, the types of exposures that represented developments of four years before 1945 the period of occupation They were not fundamentally interested in basic changes in their formula of medical education The veil that is drawn over Soviet medicine was keenly felt in the European theater of operations We had not close access to their developments We nevertheless realized that they were heading toward an ideal that had not yet been attained It would answer the mutual purposes of medicine in the Soviet Union and in the world at large if there were greater candor on the part of both contracting parties It is a circumstance of importance to bear in mind that the British have for over four years had an Anglo Soviet Union that has effectively first, initiated a one way movement of information, Britain to Russia, and now recently is obtaining a return lend-lease effect if you will Britain suffered primarily from the failure to envisage the effects of a reducation of graduate training and as early as Oct 8, 1942 General Hood, in one of his directorate meetings, stated that the R M C was the greatest consumer of medical manpower and until this demand decreased the supply would become increasingly insufficient At that early date the fall of 1942 it was quite apparent that the British were suffering from a depletion in their ranks of specialists that, if this continued the short term training would lead to a decrease in the efficiency of the services in these several specialties Obviously the American people, being independent of thought and action sacrificed the same end rather than profit by the example of the British I think that this particular commentary on our shortsightedness is beginning to show its effects in our tremendous concern for the future of graduate medical education

### Training in Medicine Under the Army Specialized Training Program

COLONEL FRANCIS M FITTS, M C Office, Director of Military Training A S F Between May 1943 and October 1945, 20 336 enlisted men were assigned to Army Specialized Training Units at seventy-six approved schools of medicine in this country These enlisted men—A S T P trainees—were there detailed for instruction in medicine in the standard curriculum of the institution. After successful completion of their medical studies 10 098 trainees have been discharged from their enlisted status in order to accept, with only negligible exceptions commissions in the Medical Corps of the Army of the United States Of the 8 049 enlisted men now in the program, 3 356 are scheduled to graduate before July of this year, when the A S T P will have become a thing of the past Shall I say another noble experiment ?

Over 4 500 of the medical officers currently in the Army completed their medical schooling under the A S T P After from nine to twenty seven months additional training in civilian hospitals they were ordered to active military service In the next five months 5 000 others, now in hospitals will enter on duties as medical officers Thereafter 3 900 other A S T P graduates will become available, at known intervals, as replacements for high score emergency officers who otherwise probably could not be released from the military service If the compulsion of the national emergency is continued these young officers trained by the government for this specific duty will serve a minimum of three years in the Medical Corps as have so many thousands of their predecessors

Approximately 897 enlisted trainees have been separated from the medical phase of the Army Specialized Training Program by reason of academic failure, 903 for reasons other than academic If physically qualified, they have been assigned to other military duties, practically all to units and installations of the Medical Department

Of the men now in training, 4 693 who will not graduate during the current fiscal year will be separated from the A S T P next month Those among them who plan to continue the study of medicine—and are acceptable to an approved school—will be placed in the Enlisted Reserve Corps and released from active military service to pursue their medical studies as civilians As reservists they will be subject to recall to active duty if they abandon the study of medicine

If any trainees do not plan to continue in medicine or are not considered so qualified they will be transferred to military duties other than in the A S T P They will of course, be eligible for discharge as are all other enlisted personnel

### Medicine in the Future

DR GEORGE F LULL, Chicago The Hill Burton bill, designed to give better hospital and clinical facilities to the public has the approval of the American Medical Association and has passed one of the houses of Congress Determination of location arrived at politically should be fought as this in many instances will defeat the purpose of the bill Hospitals cannot be run unless properly staffed

In the field of medical education the colleges are getting off the accelerated program and returning to the normal school year New schools are being formed and some of the two year schools have extended their courses to four years This will mean an increase in graduates, but the increase will not be apparent for a few years

The training of specialists has advanced to a remarkable degree in the past decade Better trained young men are being made available each year In addition more and more young graduates annually desire to continue training in some specialty This is a laudable effort as it means several more years of hard work as well as as a sacrifice of earning power The demands of the government services for doctors to fill their peacetime requirements will be greater than before the war The Navy Medical Corps has been increased over 200 per cent The Army Medical Corps has received a piecemeal increase of approximately 50 per cent pending definite legislation as to the size of the Army The Veterans Administration will undergo an enormous expansion and will require a large full time staff in addition to consultants and visiting staffs

Many advances have been made during the war which will reflect themselves in future medical practice One of these is the handling and treatment of the neuropsychiatric patient In the huge First Army in France there were at one time twenty-one neuropsychiatrists As a result of having these trained men available, 60 per cent of all neuropsychiatric casualties were returned to duty without leaving the army area This compares with 50 per cent of medical cases and 70 per cent of surgical cases Much of the difficulty that was encountered in handling this type of case in the armed forces was due to the fact that very few doctors had any training in treating these individuals

Preventive medicine has accomplished medical wonders in the present war In the largest army ever assembled there have been no serious outbreaks of infectious diseases The accomplishment of disease prevention in the Army is similar to that in civil life with the exception of the fact that in the Army, population groups are controlled However, one important factor has stood out in this war as to the results obtained in disease prevention, and that is health education The line commander as well as the individual soldier must be made health conscious and this can be done only by health education.

At the present time the United States is the medical center of the world. Better medicine is being taught and practiced in this country than in any other place. We should strive not to stand still but to improve and to retain our place as world leaders in medicine

FEBRUARY 11—AFTERNOON

## GENERAL AND SPECIALTY PRACTICE

### Problems in Specialty Practice

DR. PAUL TITUS, Pittsburgh Critics have charged that the American boards are responsible for the placing of hypervalues on certification, for creating "class distinctions" within the medical profession and for "discrimination" against general practitioners and uncertified specialists It has been charged that the boards and these activities of theirs have artificially stimulated specialization and that as a result the general practitioner may soon become extinct In the first place the American boards and the certifications granted by them actually work for and with the nonspecialist portion of the medical profession and by the rigidity of their standards for recognition of specialists, actually help to maintain the ranks of the general practitioners The boards have established levels of training requirements which make it impossible for any man to become a self styled specialist overnight with nothing to refute his claim What is the chief clamor about specialization we are hearing? It is a clamor for training! This training is wanted so that the applicant can eventually become certified by an American board, so that it must, therefore, be good training Levels of requirements have not been lowered by the boards during the war The Council and the American colleges are determined that standards of training shall not be lowered

Certification is formal recognition of qualification in a specialty based on actual training and experience The type and amount of training required by the American boards is not something that can be acquired easily or within a few weeks time Facilities for such training depend on the recognition of a hospital as an educational institution for the training of residents by competent and interested teachers with ample clinical teaching material "Refresher' courses of short duration are an entirely different matter, and these should and can easily be provided to meet all present demands Such courses have no standing before the boards for credits as training in a specialty

Without overexpansion some veterans now seeking residency training may be unable to begin training at once or perhaps at all but at least the matter of selection for places may still be based to some extent on ability and promise, while overextension of facilities might readily result in poorer training for all Moreover, fully meeting the demand is probably unnecessary because many veteran physicians who now think they want to tread the long road of required training have neither the aptitude to become specialists nor the fortitude to complete the journey even with help of government grants to veterans and hospital salaries to residents

It is the exceptional institution that has facilities, including staff, special services and clinical material, to warrant full approval in all the fifteen specialties represented by American boards Far more are able to acquire full approval in some of the specialties and limited approval in several or perhaps all of the other specialties This combination is good, however because fundamental requirements such as libraries, acceptable laboratories and a formal schedule of general clinical instruction and training in the basic sciences must be established and therefore are available to the weaker as well as to the strong departments Still other hospitals have such restricted but nevertheless good teaching facilities that they may not be able to have unlimited approval in any of the specialties although they do qualify for limited approval in some of the specialties These institutions are usually on their way to a better status and their ambitious efforts should be encouraged

### The Practice of General Medicine

DR WILLIAM A O'BRIEN Minneapolis If a medical graduate desires advanced training in a specialty he has the guidance of one of the American boards to help him plan his program but if he is undecided as to which specialty he prefers or if he wishes to become a general medical practitioner he receives conflicting advice or none at all Recent graduates are well aware of the need for general medical practitioners, but they also realize that only a few years training separates a general medical practitioner from a specialist, and as the latter enjoys a better social and economic standing, not only in his community but also in the profession, this may be another reason for his reluctance to enter the practice of general medicine following an internship

If the future practice of surgery and the surgical specialties is to be limited, then general medical practice will be built around a thorough knowledge of internal medicine, obstetrics, pediatrics, medical specialties and the medical aspect of the surgical specialties In well organized hospitals all patients now must pass through the hands of an internist for a complete medical check-up before they are seen by the surgical specialists, and this is the ideal relationship between the two groups (The practice of pediatrics is primarily internal medicine in a younger age group)

Systems in which general medical practitioners do not have hospital privileges if they are not specialists are open to serious criticism In our country this problem has already been met in departmentalized voluntary hospitals by placing the general medical practitioners in the medical service and giving them special privileges in the obstetric service and in the medical phases of some of the other specialties

The training of a general medical practitioner should start in his undergraduate days If internal medicine is the most important practical subject, then it should be given first place in the curriculum in the clinical years The medical specialties, obstetrics and pediatrics should be second, the medical aspect of the surgical specialties should be third while the technical aspects of surgery and the surgical specialties would be restricted to the graduate years

Opportunities should be provided for the continued training of general medical practitioners as well as other specialists if they are to continue to benefit from well conceived and directed undergraduate and graduate training programs The University of Minnesota has recognized three definite types of programs (1) undergraduate, which was started sixty years ago, (2) graduate, thirty years ago and (3) continuation study, ten years ago The program of the undergraduate and graduate years is well known, but continuation study has not received the recognition it deserves

At Minnesota we abandoned the "refresher" approach for the practitioner ten years ago, as we recognized there was a difference between instructing undergraduate students and practitioners There are some fields in education in which the "refresher" approach can be used as a basis for further development (mathematics) but not in medicine. Medicine, the medical specialties, obstetrics and pediatrics are ideal subjects for continuation study for general men, courses in surgery and the surgical specialties are best limited to specialists in these fields, and specialty courses can also be offered through continuation study to certified internists, obstetricians pediatricians and other medical specialists

Recent medical graduates who are trained either as specialists and recognized by one of the fifteen specialty boards or as general medical practitioners who are recognized by their board will enter practice in smaller communities if they have been properly trained, if they are provided with the proper facilities with which to practice and if they are given opportunities to keep abreast of developments in their field through properly arranged continuation study courses in medical centers

DISCUSSION

ALPHONSE M SCHWITALLA, S J, St Louis This argument between specialization and general practice is affecting every one of the areas of medicine, with the possible exception of research, perhaps even there it is being affected The whole argument is affecting even the progress of research It is affecting education because, if we are going to prepare a general practitioner and train him, perhaps we have to reorient ourselves to the meaning of general practitioner today At one time it was thought that the medical curriculum was nothing

more or less than a preparation for the internship, but the internship today and the internship of ten years ago or twelve years ago is a different thing altogether In the field of hospital practice we are again face to face with this same problem of the relations between general practice and specialization There are hospitals that are ambitious, that ambition restricting their practice. I am talking about hospitals not under university control, where there is, to some extent, a closed staff, but even there the same problem confronts us, because there are people who have said, as some medical societies have said that in certain areas there is no justification for a closed staff hospital and there is a good deal to be said for that point of view The question may be definitely raised as to whether any of our schools or any of our school hospitals have a right to a closed staff in the strict sense of the word A good deal could be said on both sides of that argument

DR A J CARLSON, Chicago I was impressed by this case report from northern Minnesota of Dr O Brien In my experience of fifty years that kind of man can t be produced by any kind of thing, internal or external There is something in that person from the start, and that is a bigger thing, in my judgment, than any training you give him, undergraduate or postgraduate.

DR PAUL TITUS, Pittsburgh I believe that better training of specialists in hospitals, where hospitals are established as educational institutions, properly established so that they can give better training for their residents, is automatically going to give better training for their interns Is it not equally true that, where the Council, in its wisdom, has established the limited periods of residency training, many of those will be available to men who never intend to go on with the full period of training in order to get certification, but they too will be made far better general practitioners because they did have some of these specialties? If that can be pursued, first make facilities for that sort of additional training available to these men, and then pursue the course laid out by Dr O'Brien groove them into the lines they should be grooved into I definitely insist it is going to improve the standards of practice in this country At the same time it carries out what I contend was the original contention of the boards, namely to improve the standards of the practice of medicine for the benefit of the public.

DR WILLIAM A O BRIEN, Minneapolis I think in our experience in continuation education, one of the best things we have learned is that, when the men who are highly specialized in their field instruct the general men, they not only show the general men how far they may go with safety but they also make them more critical persons in referring patients for more complicated procedures One of the things that our specialty group likes about instructing general men is that particular feature They work together much better afterward than before

## *MEDICAL EDUCATION AND RESEARCH*

### Federal Aid to Medical Research

DR. KENNETH B TURNER, New York The possibility that federal aid to medical research, which had been inaugurated as a wartime measure, might be continued after the war received official standing in November 1944 when President Roosevelt addressed his well known letter to Dr Vannevar Bush, director of the Office of Scientific Research and Development, asking for recommendations concerning a program of future federal aid to science.

To advise Dr Bush, four committees were appointed, including a Medical Advisory Committee with Dr Walter W Palmer of New York as chairman This committee began a three month study in January 1945 It held meetings in New York, Washington, Denver and Chicago It conferred with representatives from seventy-three of the seventy-seven medical schools of the United States, from the services, from various research institutes, from the pharmaceutical industry and from philanthropic foundations In addition it received written comment and advice from hundreds of other scientists throughout the country Based on this study a report was submitted to Dr Bush in April

The report recognized that government aid to medical research was necessary, stressed the importance of supporting long-term, fundamental research, advised that funds be made available as unrestricted grants, scholarships and grants-in-aid, and proposed the creation of an independent federal agency to be called the National Foundation for Medical Research

A few days after the submission of the Bush report two bills were introduced into the Senate, each designed to establish a national foundation for scientific research organized on the basis of a number of professional divisions with an overall authority One bill, introduced by Senator Magnuson, was based on the Bush report, the other, by Senator Kilgore, was a rewrite of an earlier bill that had been pending There were also a number of related bills, introduced about this time or somewhat earlier It is the Magnuson and Kilgore bills that have received the most attention and that have caused the controversial discussion which began with the introduction of the bills and has continued to the present

The importance of agreeing on a single bill in committee and thus avoiding the necessity of reporting two or more bills to the Senate floor has always been clearly in mind In the past few weeks there have been conferences among Dr Bush, Dr Bowman Senator Kilgore, Senator Magnuson and other interested senators in an attempt to reach an acceptable compromise measure I am happy to be able to report that this goal was achieved at a final meeting in Washington the day before yesterday At that time it was decided to drop both the Magnuson and the Kilgore bills and to write a new bill around the latter which will be reported out by the subcommittees under the joint sponsorship of Senator Kilgore, Senator Magnuson, Senator Saltonstall and others

To secure agreement on this new measure it was necessary to settle a number of important controversial points board vs administrator as top authority, method of appointing divisional committees, definition of their functions and the creation of new divisions, inclusion of the social sciences, patents, and the mandatory apportionment of funds One of the most difficult of these concerned the top authority Here it seemed that the opposing views were virtually irreconcilable The Kilgore bill had vested power in an administrator with a board acting only in an advisory capacity This form of "straight line" organization was strongly favored by President Truman, the director of the budget and the director of war mobilization and reconversion as promoting efficiency and defining responsibility It was strongly opposed by most scientists, who believed that one man in a position of such power was peculiarly vulnerable to political pressure, that few men were qualified for a job of such proportions and complexity and that the advisory board would become a rubber stamp The Magnuson bill, on the other hand had vested power in a board with the administrator appointed by and responsible to the board. The impasse has been broken by agreeing on an administrator as the top authority but with the safeguard that, before appointing him the President shall consult with and receive the recommendations of the board which will be composed of nine presidentially appointed members plus the chairman of the divisional scientific committees Furthermore the board is to have its own full time administrative staff, including an executive secretary, and is to be required to submit to the President and the Congress an independent report annually or at shorter intervals

This is a satisfactory and workable compromise The straight line type of organization is maintained, but there is also a strong board which has a hand in the selection of the administrator and which can act as a watchdog over the affairs of the foundation

Second in importance only to the advisory board are the divisional committees It is now agreed that the selection and appointment of scientists to these committees shall be made by the administrator but only with the advice and approval of the

board The functions of the divisions are to be defined by the administrator and new divisions created by him also only after receiving the advice of the board

When we have secured the passage of the bill, we must maintain unceasing vigilance to insure the appointment of the ablest citizens to the advisory board and the ablest scientists to the professional committees, and to insure further that the principles so ably set forth in the Bush report govern the conduct of the foundation Whether we like it or not, with federal aid to medical research, medicine is in politics

### Research in Undergraduate Medical Education

DETLEV W BRONK, PH D, Philadelphia The abstract of this paper has not been obtained

### Protection of Animal Experimentation

DR. A J CARLSON, Chicago Antivivisection bills are pending in Congress and in the legislatures of New York, Massachusetts, Maryland and other states Another bill has just been introduced in the New York state legislature at Albany This second bill puts scientific experiments on dogs under the authority of the state health department. The health department may license medical students and medical and biologic investigators to conduct such experiments on payment of an annual license fee of $1,000 and posting of a bond of $5,000 How, if such experiments are cruel and futile, will licensing by the state health department make them any less cruel and futile? And what about the state of New York charging medical students and medical and biologic investigators an annual license fee of $1,000 for doing their best to advance medicine and biology? To me it does not make sense.

The moral code of civilized man reads thus As between man and animals, man comes first This is the law of life. But when man uses or destroys animals for man's own protection, aid and other needs, such use must be conducted without cruelty Certainly it cannot be immoral to use animals humanely to mitigate human suffering due to disease, as long as we believe animals may be sacrificed for human food and clothing If man is not worth more than the dog, then our efforts to improve man is an error

We use animals, by common consent, for food, for clothing, for labor, for pleasure. How can it be wrong to use animals humanely to increase our understanding of life, our control of disease, both of which contribute to human happiness? We must retain a sense of proportion.

Obviously in some studies, such as those in nutrition, metabolism, kidney disease, stomach ulcer, cancer and pneumonia, anesthesia is not and cannot be used The animals suffer some discomfort but never more and probably less than a human being afflicted with such diseases The results of such studies are among those which are most immediately applicable to the mitigation of diseases in man and animals

Our efforts toward prevention and control of infantile paralysis would be hopeless except for the use of some species of monkeys and rodents in detecting and following the poliomyelitis virus And yet the Antivivisection League of Los Angeles publicly proclaims that "it does not support the March of Dimes campaign."

There were more than thirty years of intensive research on animals—mainly on the dog—before we had the substance insulin in sufficient purity to warrant its trial on persons sick with diabetes

The lowly mouse, not to mention many other species, has served man well in research on cancer Animal experimentation has been a great factor also in giving us better knowledge and control of anemia digestive and kidney disorders, glandular disturbances, nervous diseases, hookworm, scurvy, pellagra and malaria.

#### GENERAL DISCUSSION

DR. EWEN MACEWEN, Iowa City I have gone on record as favoring the Magnuson bill, not because I considered it the ideal bill but, as Dr Turner has so well shown, the least unsatisfactory We weren't in favor of this federal research because, as he has so well stated, certain conditions have changed our prewar vision. First, let me say, the gap which has taken place in the oncoming crop of scientists was due to draft necessity When one considers that of every hundred children that enter the fifth grade, only about forty-two graduate from the eighth grade and about 7 per cent finish college, and a small group of these ultimately go on to research, we realize how slow it is going to be to fill up this gap that has occurred during the past five years On the other hand, I realize that during the next few years, unless most of us are mistaken, there is going to be a tremendous drive, an international drive for scientific supremacy Certainly if we are to keep up with nations that are in competition, we need more funds than we did before the war Hence the only way is to get it through a federal research foundation, because I can see no hope at the state level or through local finances

DR. JOSEPH C HINSEY, New York The situation in New York is really an acute one If we had not prepared for the present campaign we would be in a bad position As a result of the activities of the state and county medical societies—and I may say they have been active—the Friends of Medical Research, the medical institutions of the state, the health department, excellent publicity has been obtained The state medical society has published a new bulletin which has been sent out to editors and to various members throughout the state This has been of great help in keeping up the progress of the campaign From organizations like the public health council, the state dental society, the state veterinary medical society and the Greater New York Hospital Association resolutions have gone to Albany not only from the organizations but from the membership The New York State pharmaceutical organization is placing literature in the hands of every druggist in the state The State Charities Aid Association has sent a special bulletin to sixty-two local county tuberculosis and health associations, warning of the danger of the law The medical students over the state have been working industriously not only among themselves but among people outside. Publicity has come from the finest papers in the state, the large papers in New York, with the exception of the Hearst press, the papers upstate and in the little local communities The beauty of the publicity has been that it has been excellently conducted Furthermore, it has encouraged people to write to Albany in protest of this bill Just to see how far our plans have gone, last week in New York an award was made at the American Museum, the Whipple Award sponsored by the American Museum of Natural History—the Friends of Medical Research It was an award given to two of Dr Whipple's dogs for their contribution to medical research This was beautifully dramatized in the papers of New York, with pictures, and had a real effect in certain quarters These dogs, Josie and Trixie, are descendants of the first dogs on which Dr Whipple did his work, starting in California Some people would argue that this problem can be met only on a local basis I am convinced that there is something much broader and more important and something that needs to be dealt with on a national basis I visualize that one of the main functions of a national commission of the type Dr Carlson has described is the development of better public relations and stressing the role that animal experimentation has played and will play in the progress of medical science We need an organization to do this on a national scale Furthermore, we need an organization to coordinate the activities of the local organizations

DR CHARLES GORDON HEYD, New York I should like to reenforce the remarks of Dr Hinsey All agitation and all bills against experiments on animals are a continuing and direct attack on the practice of scientific advancement of medicine. It is *no fight for the duration*, it is a continuous and never ending battle against the darkness, emotionalism and fanaticism that is inherent in human beings The opponents of animal experimentation are organized, backed by large sums of money and with an adequate if not too truthful press Therefore it is incumbent on all scientific bodies, not only medicine, to create a national organization that shall be the controlling influence, that will be the general staff from now on to the indefinite

future, to oppose and to contest with these groups the imposition of legislative slavery on the expansion of human research The meeting that Dr Hinsey referred to comprised every variety of individual associated with any of the disciplines in the sciences They organized spontaneously a group called the Friends of Medical Research The public relations department of the state society came into action, as did the sixty-eight constituent county societies of the medical society of the state They appointed an activated and organizing committee Funds were solicited The funds were forthcoming adequately and promptly I am delegated by the Academy of Medicine and the Medical Society of the State of New York to tell Dr Carlson that all the funds that we have collected, after our expenses are paid, are going to be given to his national organization, that this equipment can be boxed and sent to any state or territory in the United States and brought into action, that our forms for these thousands and hundreds of thousands of pieces of literature are at the disposal of the national group, that we do not wish New York State to set up any organization that has any national implications We want a separate body that shall be national in scope, with a central office, with expert people, so that every statement is incontestable and incontrovertible. We want a group represented by Dr Carlson to implement this national picture What we have developed in technics and which has been significantly successful we bring publicly here and make an offering of our appreciation for the efforts of Dr Carlson and his group and present it to him with the compliments of people who feelingly in New York State are prepared to go any distance that medical research, scientific research, shall not pass and perish from our country

DR E. I EVANS, Richmond, Va One point that seems to me very important, and that we are forgetting continually, is this matter of the elements of observation If ever there was a need for some real learning of principles it is to develop this matter of observation in clinical teaching Unfortunately, it is getting to be my impression in clinical matters that very few people who look at clinical facts or patients see anything It would seem to me that one of the real things we could do for students—I think it could be used as a research tool in undergraduate teaching—would be re-search, it won't be research simply to teach a young student to look at patients and decide from seeing certain facts

DR. JOHN B TRUSLOW, Washington, D C. During the last six months two groups of our society, government and science, who have traditionally regarded each other with a mixture of awe and fear and compensatory belittlement, learned enough of each other's language and became sufficiently convinced of each other's integrity and sincerity that today we have a bill admitted by both legislators and Congressmen and scientists to be a great improvement over either of the bills which originally embodied their respective positions These six months have been tough The two groups at times were poles apart. Each group *conducted its thinking* and activities at times as though the other group was not only unimportant to the passage of the bill but a menace to progress, democracy and the sacred traditions of science. The important thing therefore, is not only the production of this excellent bill but also the proof and, for medical legislation, the precedent, in my opinion, that national legislation can be written, as it always should be written, with a lot of thought, a lot of misunderstanding turning into understanding, a lot of education on both sides

A S HARRIS, PH D Cleveland I want to endorse what the last speaker just said about the National Science Foundation. I think that we who are friends of animal experimentation shouldn't talk too much of defense and protection but rather, take a more positive attitude and speak of advancement or promotion of science by animal experimentation We have to put on our educational program he talked about and for which he has *pointed the way It isn't a matter of hammer and* tong, I hope, but of real education and largely by interesting stories that can be written about the drama of science and as it has developed

## MEDICOLEGAL ABSTRACTS

**Workmen's Compensation Acts Evidence Held Sufficient to Show That Death Caused by Tetanus Arose Out of the Deceased's Employment**—The plaintiff employer filed this action to set aside an award of the Industrial Commission From a judgment affirming the award, the plaintiff appealed to the Supreme Court of Wisconsin

Quandt died of tetanus infection following an onset which started two and one-half days previous to his death An autopsy disclosed an abrasion on the tip of one finger of his right hand which had apparently healed The widow testified that the deceased dressed this abrasion several times just prior to his death and that it was an ugly jab caused by the slipping of a drill while he was remodeling a butcher shop about two weeks before he died In the course of his job he had to handle old lumber, animals were butchered in the room in which he worked, and there were hides in the same room which he had to move out of his way There was medical evidence that tetanus occurs frequently in the vicinity of animals, that manure is especially likely to contain tetanus germs, that unless the animals are kept clean the outside of the hides is apt to be so infested and that dirt is a frequent source of tetanus infection The evidence was sufficient, therefore, to warrant a finding that the repair job engaged in by deceased involved exposure to tetanus infection The wound on the deceased's finger showed no sign of local irritation or infection at the time of his death, but the medical evidence was to the effect that this was not decisive in cases of tetanus On the basis of the medical testimony, the court said that while some people have tetanus germs within their bodies, particularly their intestinal tracts, and it is possible for the germs to cause a tetanus lesion without an outside wound, nevertheless the probability is the other way and a wound is the most likely place for the germs to enter The history of this case, concluded the court, indicates the injured finger as the portal of infection and the hides as the source of the tetanus germs The plaintiff's objection that the commission resorted to standard medical textbooks to form and justify its conclusions as to the nature and likelihood of idiopathic tetanus was held to be immaterial We are hardly in a position, said the Supreme Court, to supervise the acquisition or use by the commission of expert learning in the various fields which call for administrative action on its part Accordingly the award was sustained and the judgment in favor of the defendant affirmed—*Gmeiner & Grearson et al v Industrial Commission et al, 20 N W (2d) 543 (Wis, 1945)*

**Drunkenness Results of Chemical Tests of Blood Taken from Unconscious Person—Use During Trial—Self Incrimination**—The defendant was convicted of manslaughter on a charge of operating a motor vehicle on a public highway while under the influence of intoxicating liquor From such conviction he appealed to the Supreme Court of Oregon

After the accident out of which the charge of manslaughter against the defendant arose, the defendant remained unconscious for a period of about forty-eight hours While unconscious he was arrested and taken into custody by a state police officer and treated for his injuries by Dr Manning At the request of the police officer, Dr Manning was induced to extract a sample of blood from the defendant for the purpose of having it analyzed to determine its alcoholic content This blood sample was taken by the officer to a physician in Portland, Ore, for analysis At the hearing the Portland physician testified that the sample "contained 260 milligrams of alcohol per one hundred cc's" The admission in evidence of this testimony was objected to primarily on the ground that the use of such testimony was a violation of the constitutional provision that no person shall be compelled in any criminal prosecution to testify against himself and that such testimony is to be taken as an admission or confession or as evidence of a physical examination

The only question before us for decision, said the Supreme Court, is whether the compulsory taking of the blood sample from the defendant and the admission of testimony disclosing its alcoholic content was a denial to the defendant of his constitutional privilege against self incrimination The protection from "testifying," from "furnishing evidence" or from "being a witness" was provided in order to place beyond the reach of ordinary legislative alteration the privilege against self incrimination Assuredly, the object of this protection is the employment of legal process to extract from the person's own lips an admission of his guilt which will thus take the place of other evidence. In other words, it is not merely any and every compulsion, but testimonial compulsion, that is the kernel of the privilege If the arrest of a prisoner is lawful, the officer making the arrest may search the person of the prisoner and take from him not only the instruments of the crime but also such articles as may be of use as evidence on the trial For purposes of identification, an accused may be required to do many things without having his constitutional rights against self incrimination invaded Accordingly, a defendant may be required to stand up in court, to put on a blouse to see if it fits, to place a handkerchief over his face, to stand up and remove his glasses, to remove his shirt and coat and permit the jury to see scars on his body and to don a shirt introduced in evidence, and to exhibit his arm so as to reveal tattoo marks thereon, which a previous witness has sworn were there. He may also be fingerprinted, photographed and measured under the Bertillon system

In the case at bar it was conceded that the defendant was in custody and under lawful arrest at the time the blood sample was extracted from his veins and that he was unconscious at the time However, prior to the trial both the defendant and his attorney were advised by the district attorney that the blood sample had been taken No motion was made for its return or suppression At the trial no objection was made to the admission of testimony as to the extraction of blood or the analysis thereof on the ground that the Oregon constitution prohibiting unreasonable search or seizure had been violated In fact, counsel for defendant stated on oral argument that he was not urging that the blood sample had been seized in contravention of the search and seizure provision In *State v Gatton*, 60 Ohio App 192, 20 N E (2d) 265, the court observed that such evidence was not required to be given by the defendant himself but was given by the deputy sheriff and by the doctor called to make the examination "We are unable," said that court, "to observe any merit in the defendant's claim that the introduction of such evidence violated his constitutional rights, and we believe, and hold, that the constitutional inhibition against self crimination relates only, as stated by Greenleaf, to disclosure by utterance No such disclosure was required of defendant in this case"

The defendant was not deprived of any of his constitutional rights by the admission of the testimony here in question, said the Supreme Court He was not compelled to testify against himself Evidence of the result of the analysis of the blood sample was not his testimony but that of Dr Beeman The blood sample was obtained without the use of any process against him as a witness He was not required to establish the authenticity, identity or origin of the blood, those facts were proved by other witnesses If the evidence here under attack is inadmissible, said the court, it is difficult to understand under what theory fingerprints procured under compulsion, or evidence concerning them, is admissible It is equally difficult to comprehend why a defendant is not denied his constitutional privilege against self incrimination by being required to do the many other acts previously referred to In holding that the testimony concerning the blood sample was admissible, the court concluded, we are not deciding that an accused can be forced to undergo a physical examination or to submit to a blood test The question of unlawful search and seizure is not involved Moreover, the defendant was under arrest at the time the blood sample was taken Accordingly the admission of the evidence in question was held to be proper and the defendant's conviction was affirmed—*State v Cram, 160 P (2d) 283 (Ore, 1945)*

## AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days Three journals may be borrowed at a time Periodicals are available from 1936 to date Requests for issues of earlier date cannot be filled Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested) Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order Reprints as a rule are the property of authors and can be obtained for permanent possession only from them

Titles marked with an asterisk (*) are abstracted below

### American Journal of Clinical Pathology, Baltimore

**15** 489 554 (Nov) 1945

Malarial Pigment Consideration of Mechanism of Elimination from Duck R H Rigdon —p 489
Malaria Transmitted by Bank Blood Transfusion Report of 2 Cases J G Sharnoff J Geiger and I Selzer —p 494
Improved Method of Examination of Feces for Diagnosis of Intestinal Schistosomiasis T H Weller and G J Dammin —p 496
Canine Histoplasmosis Pathologic Study of 3 Reported Cases and First Case Found in the Canal Zone W J Tomlinson and R G Grocott —p 501
*Acute Infectious Lymphocytosis. R F Birge and L. F Hill —p 508
Specific Types of Alpha Streptococci and Streptococcal Antigen in Unpotable Water and Water Supplies E C Rosenow —p 513
Relationship of So Called Giant Cell Tumor' to Frontal Bone Report of Case Elizabeth Ferrington and J A Mufson —p 529
Liver Abscess Due to Friendlander s Bacillus (K. Pneumoniae) Complicating Adenocarcinoma of Ampulla of Vater J K Norman and C H Binford —p 534

**Acute Infectious Lymphocytosis**—Birge and Hill report the occurrence of acute infectious lymphocytosis in a girl aged 4 This disease of children named by Smith in 1941 acute infectious lymphocytosis, is characterized by pronounced absolute lymphocytosis of three to nine weeks' duration Often it occurs without clinical signs or symptoms Occasionally it is accompanied by slight fever, symptoms of upper respiratory infection abdominal pain of short duration or signs of meningeal irritation with slight pleocytosis The cause is not known The prognosis is favorable The disease is communicable and occurs in all seasons It seems to be a specific entity and differs from infectious mononucleosis in many respects Lymphadenopathy and splenomegaly are not encountered, lymphocyte counts are higher, lymphocytes are normal in appearance the heterophile antibody test is negative. Bone marrow obtained from another recently studied case showed slight increase in small lymphocytes without other changes

### American Journal of Hygiene, Baltimore

**43** 1-90 (Jan) 1946

Bat Malaria R D Manwell.—p 1
Studies on Mosquitoes of Genus Hemagogus in Colombia (Diptera Culicidae) H W Kumm E Osorno Mesa and J Boshell Manrique. —p 13
Periodicity of Influenza Commission on Acute Respiratory Disease. —p 29
Studies on Specificity of Intradermal Tests in Diagnosis of Filariasis D L Augustine and Camille Lherisson —p 38
Effect of Immunization Against Lactobacilli and Acidogenic Cocci on Tooth Flora of Rat Elizabeth I Parsons E V McCollum and M Frobisher Jr —p 41
Epidemiologic and Experimental Observations of Poliomyelitis in New York City (1943 1944) C W Jungeblut and G Dalldorf —p 49
*Effect of Double Bunking in Barracks on Incidence of Respiratory Disease Commission on Acute Respiratory Disease —p 65
Differences Among Strains of Poliomyelitis Virus in Macaca Mulatta J F Kessel, F J Moore and C F Pait.—p 82

**Double Bunking in Barracks and Respiratory Disease**—According to the Commission on Acute Respiratory Diseases there are theoretical reasons for believing that double bunking without concomitant crowding may be a desirable method of quartering troops The procedure provides more available floor space for the men during off-duty hours and results in a greater separation between the men while sleeping If acute respiratory diseases are acquired largely in the barracks and if direct droplet spread is an important factor in transmission of infection it might reasonably be expected that double bunking would reduce the frequency of close contact and thereby result in a lowering of the incidence of disease If, however, either droplet nuclei or contaminated dust particles are the dominant factors, double bunking could not be expected to have an effect since the total cubic feet of air space available per man remains unchanged During an epidemic of acute undifferentiated respiratory disease significantly lower incidence rates were observed among men living in barracks equipped with double bunks than in control barracks There appears to be no objection to the general use of double bunks, provided overcrowding is avoided

### American J Obstetrics and Gynecology, St. Louis

**51** 1-150 (Jan) 1946

Carcinoma Subsequent to Radiotherapeutic Menopause J A Corscaden J W Fertig and S B Gusberg —p 1
Value of Physiologic Substrates in Sperm Migration in Selected Cases of Human Infertility Observations on a Series of 106 Patients S L Siegler —p 13
*Postmenopausal Endometrium and Its Relation to Adenocarcinoma of Corpus Uteri Study of 236 Cases G T R. Fahlund and A C Broders —p 22
Anovulatory Cycle and Menstruation R Meyer —p 39
Selective Treatment of Antepartum Hemorrhage W A Scott —p 48
Histologic Study of Effect of Irradiation on Adenocarcinoma of Endometrium L M Stowe —p 57
Management and Treatment of Late Toxemias of Pregnancy S A Cosgrove and L C Chesley —p 67
Oral Therapy with Ethinyl Estradiol in the Menopause H Wiesbader and W Filler —p 75
Pyridoxine Failure in Nausea and Vomiting of Pregnancy H C Hesseltine —p 82
*Sulfathiazole in Control of Epidemic Diarrhea of Newborn M Leff —p 87
Sulfanilamide and Sulfathiazole Absorption via Rectum and Vagina Further Studies G L Carrington and M A Hannah —p 90
Are Antihormones Formed During Pregnancy? J H Leathem and A E Rakoff —p 97
Ethinyl Estradiol in Treatment of Metrorrhagia. W Bickers —p 100
Puerperal Sterilization R Van Dyck Knight.—p 104
Panhysterectomy Without Vaginal Cleansing T Cianfrani and J H Zeigerman —p 109
Cesarean Section on Poliomyelitic Patient Confined to Respirator H Strauss and S S Bluestone —p 114
Double Uterus and Double Vagina Identical Doubles Demonstrated by Colpohysterosalpingography R R Killinger and H. B McEuen —p 121
Subperitoneal Baldy Webster Uterine Suspension M L McCall and E A Schumann —p 125

**Postmenopausal Endometrium and Adenocarcinoma**—The material studied by Fahlund and Broders consisted of gross and microscopic specimens of postmenopausal uteri, detailed descriptions of specimens and clinical and operative records of 236 cases of the Mayo Clinic The 236 cases included 86 cases in which the uterus had been removed because of adenocarcinoma 100 cases in which the uterus had been removed for other reasons and 50 cases in which routine necropsy had been performed In the 86 women with adenocarcinoma of the corpus uteri, all but 1 had vaginal bleeding or spotting as a presenting complaint. There was no appreciable difference in the percentage of cases of any given type of endometrium in adenocarcinomatous uteri as compared with nonadenocarcinomatous uteri except with regard to atrophic endometrium Thus 41 8 per cent of cases of uteri with cancer showed atrophic endometrium and only 16 per cent of cases of uteri without cancer showed atrophic endometrium. This suggests that adenocarcinoma of the uterine corpus is more likely to occur in cases in which there is atrophy of the endometrium than in cases in which there is no atrophy The percentage of cases with grade 3 and 4 cystic change and with grade 3 and 4 accumulation of secretion was roughly the same in the two groups of cases Approximately 42 per cent of adenocarcinomatous uteri showed no cystic changes, whereas 20 per cent of nonadenocarcinomatous uteri showed no cystic changes This lends evidence contrary to the view that the 'Swiss cheese endometrium' of Novak has features predisposing to the development of carcinoma Subbasal glands seem to have no causal relationship to adenocarcinoma of the uterus There was virtually no difference in average thickness of the endometrium in adenocarcinomatous uteri as compared with nonadenocarcinomatous uteri The incidence of endometrial polypi in uteri without adenocarcinoma was roughly eight times greater than their incidence in uteri containing adenocarcinoma However, previous curettage in

all cases of cancer might be partially responsible for the variation The general conclusion from this comparison is that atrophic endometrium was found more often in adenocarcinomatous uteri than in nonadenocarcinomatous uteri, while endometrial polypi were found more often in nonadenocarcinomatous uteri

**Sulfathiazole in Epidemic Diarrhea of the Newborn.**—Leff describes the procedure employed at the Central Maternity Hospital in New York for the treatment of epidemic diarrhea of the newborn. Nurses are instructed to be constantly on the alert for frequent or watery stools in the newborn Treatment is instituted early and consists of 1 grain (0 06 Gm ) of sulfathiazole every three hours administered with a medicine dropper or teaspoon directly into the baby's mouth (a stock solution of 0 06 Gm per 4 cc is used) After a few doses the diarrhea is usually controlled If the diarrhea does not subside, all food is withheld for twelve hours, and saline solution is given by clysis and the medication is continued Every baby in the nursery who has been exposed is given 1 grain of sulfathiazole as a prophylactic measure Sulfathiazole given promptly at the onset of epidemic diarrhea in the newborn infant cures the disease in less than twenty-four hours and prevents its spread in the newborn nursery

## Annals of Allergy, Minneapolis

3 401-478 (Nov-Dec.) 1945

Extraction of Nitrogenous Matter from Pollens R F E Stier A L McNeil and J Ernsdorff —p 401
Fatigue and Weakness of Allergic Origin (Allergic Toxemia) to Be Differentiated from "Nervous Fatigue" or Neurasthenia. T G Randolph —p 418
Introduction of Allergen into Skin by Inunction with "Intraderm" I Additional Experimental Data on Inunction Test. F Herrmann. —p 431
Passive Transfer of Experimental Contact Dermatitis with Urbach Koenigstein Technic L H Ballestero and A Manrique Mom —p 435
*Parenteral Use of Dihydroergotamine in Migraine M M Hartman —p 440
Successful Therapy of Dermatologic Syndrome with L Casei Factor (Folic Acid) Preliminary Report A F Coca —p 443
Sinobronchial Syndrome Complicating Atopic Asthma in Children Treatment by Roentgen Ray L O Dutton and J R Fuchlow —p 447
Combined Tyrothrycin Penicillin Therapy in Contact Dermatitis. M Vaisberg —p 451

**Dihydroergotamine in Migraine**—Hartman selected 20 patients with migraine for trial Seventeen of them had obtained relief from ergotamine tartrate and 3 had not. These same 17 obtained relief by dihydroergotamine, which did not cause uterine cramps in any of the 15 female patients, 1 of whom was pregnant and 3 of whom were menstruating Only 1 of the 20 patients suffered nausea ascribable to the dihydroergotamine. Nine had nausea ascribable to ergotamine tartrate. Dihydroergotamine used intramuscularly produced no demonstrable effects on pulse rate, blood pressure, pulsations of radial, dorsalis pedis and posterior tibial arteries or the temperature and color of the extremities

## Blood, New York

1 1-98 (Jan.) 1946

Blood Brief Survey of Its Chemical Components and of Their Natural Functions and Clinical Uses E J Cohn —p 3
*Primary Congenital and Secondary Acquired Splenic Panhematopenia C A. Doan and C S Wright —p 10
Megakaryocytes in Idiopathic Thrombocytopenic Purpura a Form of Hypersplenism W Dameshek and E B Miller —p 27
Value of Penicillin in Treatment of Agranulocytosis Caused by Thiouracil Mary Catherin Tyson, P Vogel and N Rosenthal —p 53
*Differentiation of Pernicious Anemia and Certain Other Macrocytic Anemias by Distribution of Red Blood Cell Diameters G A. Daland C W Heath and G R Minot —p 67
Diagnosis of Hodgkin s Disease by Aspiration Biopsy Lucile Loseke and L F Craver —p 76

**Splenic Panhematopenia.**—Doan and Wright observed in certain general constitutional disease states involving the spleen more extensively than other organs an instability in the functional balance of the spleen, which in extreme instances resulted in an absolute lack of discrimination between senile and mature circulating elements, with excessive phagocytosis of all essential cells passing through this organ They report 3 cases 1 A girl aged 14, with congenital splenic panhematopenia, experienced excessive splenic sequestration of normal circulating blood elements, which had probably commenced a few weeks after birth and had persisted until splenectomy at 14 years of age. Almost complete cellular and physical reequilibration followed the operation immediately and has been maintained for two years 2 The second case demonstrates that splenic panhematopenia may occur as a relatively acute fulminant medical crisis 3 A woman with Gaucher's disease is an example of the indiscriminate sequestration of all circulating cellular elements by a spleen, enlarged and engorged secondary to a generalized constitutional disease.

**Differentiation of Anemias by Distribution of Red Blood Cell Diameters**—Deland and his associates studied 35 cases of pernicious anemia, 17 of refractory macrocytic anemia, 33 of macrocytic anemia secondary to a variety of causes and 10 normal persons The authors conclude that below the level of about 2,500,000 red blood cells per cubic millimeter the degree of anisocytosis as revealed by the standard deviation and the coefficient of variation of the red cell diameters serves as a fairly accurate criterion for distinguishing addisonian pernicious anemia from many other types of macrocytic anemia Below the level of 3,000,000 red blood cells per *cubic millimeter the asymmetrical skewness of the distribution* curve of the red cell diameters in pernicious anemia is an aid in distinguishing these cases from certain other types of macrocytic anemia

## California and Western Medicine, San Francisco

Experimental Production of Exophthalmos in Fundulus by Means of Anterior Pituitary Extracts A Albert —p 389
Interruption of Ovulation in Hen by Subcutaneously Administered Non specific Substances R M Fraps and B H Neher —p 407
Relation Between Ovulation Frequency and Incidence of Follicular Atresia Following Surgical Operations in Domestic Hen I Rothchild and R M Fraps —p 415
Succinic Dehydrogenase Activity of Ovarian and Lutein Tissue R K. Meyer W H McShan and Wilma F Erway —p 431
Influence of Urinary Cortin like Material on Sodium and Potassium Metabolism Mary L. Feil and R. I Dorfman —p 437
*Relation of Carbohydrate Deficient Diets to Effectiveness of Hormones of Adrenal Cortex W J Eversole —p 450
*Further Studies on Chemical Nature of Compounds Which Inhibit Function of Thyroid Gland E B Astwood A Bissell and A M Hughes —p 456

**Carbohydrate Deficient Diets and Effectiveness of Hormones of Adrenal Cortex**—Eversole states that a low carbohydrate diet greatly reduces the effectiveness of desoxycorticosterone acetate, less so than it does whole extract of the adrenal cortex. This was demonstrated in treated adrenalectomized rats fed carbohydrate deficient diets for periods of ten and twenty days The effectiveness of the preparations was partially dependent on the method of administration Cortical extract 0 5 cc. was more effective in the drinking water than when injected thrice daily and much more effective than when injected once daily Desoxycorticosterone acetate 0 5 mg was more effective when injected in an alcohol water suspension than in oil, but regardless of the method of administration it was inferior to cortical extract given in drinking water A possible explanation of these results is the conversion of fed protein to carbohydrate under the influence of adrenal cortex hormones

**Chemical Nature of Compounds Which Inhibit Thyroid Functions**—Astwood and his associates investigated the relative antithyroid activities of a variety of compounds in rats by administering various doses in the diet for periods of ten days

The degree of thyroid enlargement and the decrease in thyroid iodine concentration thus induced were used to compare the activities of new compounds with thiouracil, which was considered to have an activity of 1. Of the 220 substances investigated 115 were found to possess detectable activity and 25 proved to be as active as or more active than thiouracil. The most potent substances were derivatives of thiouracil. Two types of chemical structure were found to be associated with antithyroid activity. The more active class possessed a thiocarbonamide grouping; the less active an aminobenzene group. Of the latter the most effective substances were 4,4'-diaminodiphenylmethane, its tetramethyl derivative and 2-amino 5-sulfamylthiazole. These were approximately one fourth as active as thiouracil.

Effect of Alumina Gel on Absorption of Vitamin A from Intestinal Tract. W. S. Hoffman and Hattie A. Dyniewicz.—p. 512

**Transmission of Infectious Hepatitis by Blood Transfusion.**—Murphy reports the accidental transfusion of 2 patients with blood containing the virus of infectious hepatitis and the subsequent reproduction of the disease in the recipients. The blood was drawn from the donors and given to the recipients shortly before the donors developed hepatitis. The incubation period in the recipients from the time of transfusion to the onset of illness was twenty-four days and forty-seven days respectively. Infectious hepatitis is probably transmitted by transfusion of blood or plasma much more frequently than is realized. It appears impossible to prevent such occurrences in military personnel in overseas areas where hepatitis is epidemic and transfusions are used frequently. Persons with a history of hepatitis should not be used as blood donors.

## Illinois Medical Journal, Chicago

Hemochromatosis: Clinical, Chemical and Pathologic Study of Case. H. R. Fishback and F. H. Fowler.—p. 30

**Infections of Female Urethra.**—Roeser and Kretschmer report 41 unselected cases of chronic infection in Skene's glands and in the periurethral glands. The authors emphasize that these lesions are a frequent but overlooked cause of urinary symptoms. In the group studied frequency of urination was the chief symptom. The authors point out that good illumination is important for the examination of Skene's glands. When infected the openings of Skene's glands are red sometimes appear larger than normal and often appear elevated. Pressure may show pus exuding from them. The openings of the periurethral glands, when infected, are red and sometimes swollen. Aid in localization can be obtained by a small wire meatal speculum or a pair of bent hairpins to retract the external urethral orifice or by gentle stripping of the urethra. Urethritis is often present. Occasionally there is temporary relief by instrumentation with sounds or a cystoscope as the result of pressure of these instruments on the infected glands, causing the expression of retained discharge. Treatment consists in the destruction of the infected glands by means of the high frequency current with a fulguration electrode inserted into the bottom of the infected glands. In some cases this may be up to ½ or ¾ of an inch. The most distal glands are treated first. Following fulguration, a warm sitz bath is taken three or four times a day. The relief of symptoms is prompt. Reexamination is indicated in eight to ten weeks. Hospitalization is not necessary. Associated infection elsewhere in the urinary tract should be eliminated.

## Journal of Bone and Joint Surgery, Boston

28: 1-212 (Jan.) 1946. Partial Index

Fracture of Medial Epicondyle with Displacement into Elbow Joint. J. Patrick.—p. 143
Trichinosis as Cause of Meralgia Paresthetica. H. H. Cohen.—p. 153

**Iliac Bone Transplantation.**—Dick reports 8 cases and shows that cancellous chip grafts are of value in the arthrodesis of joints, in the repair of bone defects and in some forms of nonunion or delayed union of fractures. A cortical graft may be needed to preserve the shape of a bone, but, if stability of the fractured bone can be maintained by means other than the use of a cortical graft, cancellous chips alone will produce union. The main disadvantage of a tibial bone graft is that it usually has to be cut from an intact tibia. Plates and screws of absorbable plastic material used with cancellous chips from the ilium, would appear to be the ideal method of osteosynthesis.

**Osteochondromata of Pelvic Bones.**—Ghormley and his associates report 40 cases of osteochondroma of the innominate bone in which operation was performed at the Mayo Clinic during the years 1910 to 1943 inclusive. In each case the diagnosis was verified by microscopic examination. A total of 69 operations were performed on these patients. Nine of the patients are known to have died, and 8 are known to have had one or more recurrences. In 2 cases not all of the tumor was removed at the time of operation. In 4 of the 40 patients malignant changes were later found. In 16 patients (not included among the 40) microscopic examination revealed that the lesions were malignant at the time the patients were first operated on. The authors have seen 2 cases in which the symptoms continued and ultimately a chondroma was revealed.

**Examination of Gastric Contents in Tuberculosis.**—Banyai and Cadden during the past seven years have studied 22 cases of bone tuberculosis in which an attempt was made to corroborate the clinical diagnosis by bacteriologic examination of the fasting gastric contents. In 7 of these 22 patients with various forms of orthopedic tuberculosis tubercle bacilli were found in the fasting gastric contents. In the presence of an

orthopedic involvement of obscure origin the presence of tubercle bacilli in the fasting gastric contents, though not absolute proof of the tuberculous nature of the disease, should be looked on as important presumptive or circumstantial evidence.

Tuberculosis of Spine—p. 94

**Subacute Bacterial Endocarditis**—Favour and his associates reviewed the 347 proved cases of subacute bacterial endocarditis treated at the Peter Bent Brigham Hospital from 1913 to 1945. There were no known recoveries among 237 cases seen between 1913 and 1937, during which time a great variety of therapeutic procedures were employed. Of the 90 patients observed from 1937 to 1943, 55 received adequate treatment with a sulfonamide. Sixteen of the latter patients were given simultaneously fever therapy. Of these, 1 treated with infra-red radiation and 3 treated with typhoid vaccine recovered and have remained well for two to four years. None of the other sulfonamide treated patients recovered. Of 20 patients studied since January 1944, 17 were given large doses of penicillin. The infection of 11 patients has been cured or arrested and they are now alive. The follow-up periods vary between six and eighteen months. In 2 others the infection was bacteriologically arrested but death occurred some weeks later because of complications. Congestive heart failure may follow recovery from the infection. Dental sepsis, extraction of teeth and dental manipulations were found to be related to the onset of this disease in a surprisingly large number of cases. Infected teeth should be removed before treatment is completed as a prophylaxis against subsequent reinfection of the heart valves. Although penicillin appears to be a promising cure for subacute bacterial endocarditis, patients who recover from this disease are left with the same or further valvular deformities which continue to predispose them to reinfection or to subsequent congestive heart failure.

**"Burns" of Skin and Eyes from Scattered Cathode Rays**—Robbins and his associates report injuries received by 6 men in the department of radiology at the Massachusetts General Hospital as a result of a few seconds exposure to scattered electrons from a 1,200 kilovolt electrostatic generator. The exact dosage could not be determined but was probably between 1,000 and 2,000 "tissue roentgens." The lesions had the unusual characteristic of appearing in three phases, the last one becoming manifest approximately four weeks after the exposure. Except for a mild injection of the conjunctiva in 3 men, coming on within a few hours after the exposure, no ocular signs occurred during the first two phases of reaction. Severe ocular signs developed in 1 man in the tertiary phase and consisted of punctate epithelial lesions accompanied by severe photophobia, lacrimation and foreign body sensation. The cathode ray burns were analogous to, but different from, thermal burns and roentgen ray reactions. The primary reaction resembled an intense sunburn and lasted about the same length of time but was not followed by tanning. The secondary reaction was characterized by edema with bleb formation. At the same time 3 of the men showed new areas of involvement, appearing at varying intervals in parts which had been protected by clothing. These areas also showed superficial edema and deep plum colored pigmentation characteristic of the primary reaction. Some went on to bleb formation and even to destruction of the full thickness of the skin. Several areas that had healed broke down for the second time. None of the lesions involved tissues deeper than the dermis. In 1 man permanent injury occurred in areas of maximal destruction. Epilation was not apparent until complete destruction of the superficial layers of the skin had occurred, and only in those areas severely injured. Six months after the exposure, the hair appears to be returning even in areas where the injury was extensive and relatively deep. Pigmentation is absent or irregular in the areas of deep burns in 2 men. Telangiectasis has developed in 1 man to a greater extent than that seen in thermal burns. In comparison with severe roentgen ray reactions, the cathode ray reactions became manifest much sooner and caused decidedly less pain. The rate of recovery seemed to be much more rapid than would have been the case in lesions of similar extent caused by roentgen rays. The late effects are somewhat similar, but there seems to be considerably less atrophy in those burned by the cathode rays, and the tanning which usually follows roentgen ray reaction is not seen. Pigmentation is seen as small freckle-like areas separated by nonpigmented skin.

**Streptococcic Miliary Infiltration of Lungs** —Ellman encountered a number of nontuberculous pulmonary infections closely simulating in their clinical and radiologic appearances pulmonary tuberculosis but healing by natural resolution within a relatively short period. In some such cases the streptococcus has undoubtedly been a causal organism The author presents a case of simple achlorhydric anemia complicated by the sudden onset of acute streptococcic septicemia with miliary pulmonary localization A dramatic response to penicillin therapy (aided by transfusions and iron therapy for the anemia) resulted in complete resolution of the lung lesion In the reported case the sputum was collected on a laryngeal mirror and precautions were taken to avoid contamination by mouth organisms A heavy growth of hemolytic streptococci was repeatedly found and, in view of the severe toxemia and the clinical and radiologic lung aspects there was undoubtedly a hematogenous lung infection of streptococcic origin. Miliary infiltrations of the lung, apart from those of a tuberculous nature, may occur as a miliary carcinomatosis in silicosis, in bronchiolitis (particularly following influenza and measles), in Hodgkin's disease as a lymphadenomatosis, in leukemias, in certain pulmonary mycoses, in bilharziasis, in Boeck's sarcoidosis, in miliary amyloidosis of the lung and in miliary stasis of the lung with mitral stenosis The term miliary was used in the reported case because the radiologic appearance of the lung simulated a miliary tuberculosis

**Acute Abdominal Syndrome in Vivax Malaria** —Andrew describes an acute abdominal syndrome which was observed in 10 of about 6 000 patients with vivax malaria The syndrome is characterized by sudden severe pain in the left upper quarter of the abdomen, usually referred to the tip of the left shoulder It is accentuated by deep breathing and lasts for periods varying from a few days to many weeks Tenderness is present in the left hypochondrium, but no true rigidity The onset of the syndrome was in no case related to trauma It is usually

closely related to an overt attack of malaria but may occur three months later All patients recovered with conservative treatment. Spontaneous subcapsular hemorrhage of the spleen is thought to be the most likely cause of the syndrome

**Pregnancy and Parturition in Women with Poliomyelitic Pelvis** —In a period of ten years 15 pregnant women with pelvic asymmetry due to poliomyelitis were observed by Uranga Imaz and Dubrovsky in a group of 100,000 women who had antepartum examinations and who were delivered in the Beneficent Maternity Hospital of Buenos Aires The group included 10 primiparas, 4 secundiparas and 1 tertipara. Pelvic asymmetry of the oval pseudo-oblique type was encountered by roentgen examination in all these pregnant women *The pelvic lesions due to mechanical factors were found on the* side of the pelvis which corresponded to the normal leg When the whole leg was partially or completely paralytic, pelvic atrophy of the affected side and mechanical changes of either or both sides were encountered The pelvic changes due to mechanical factors were more complicated when crutches were not used. Parturition was normal in all women except 2, who had dystocia and uterine hypertonicity respectively These women were delivered of living normal infants by cesarean section

Postarsphenamine Jaundice in Pregnancy (with Case Report) A. Sadowsky and Y M Bromberg —p 391

**Surgical Complications of Ascariasis** —In this report Milwidsky is concerned with the surgical complications to which ascariasis may give rise. Discussing ileus due to Ascaris, he reviews 10 cases of his own and shows that there are five different types (1) mechanical obstruction by worm convolutes, (2) a paralytic type of ileus, (3) a spastic ileus, (4) invagination by ascariasis and (5) volvulus by ascariasis Milwidsky has observed perforations of the bowel, postoperative disturbances due to ascaris, appendicitis and diverticulitis as well as ascariasis of the stomach and duodenum, bile ducts and liver The 17 cases mentioned in this paper were encountered in the course of six years The most effective method to forestall surgical complications of ascariasis is its prevention by an antiparasitic prophylaxis and early anthelmintic treatment if an infestation has taken place. As soon as the acute abdominal symptoms appear, anthelmintic treatment may be dangerous At that stage surgical intervention becomes imperative.

**Porphyria Diseases**—Jørgensen and With state that the so-called acute porphyria is inherited as a dominant character and is a permanent disorder of the pyrrole metabolism, which may remain latent or lead to acute attacks of abdominal pain with or without neurologic symptoms Attacks may last hours or days They may terminate spontaneously or be fatal A tendency to spontaneous recovery is observed when barbiturates are withheld A special pyrrole substance, porphobilinogen, is converted into uroporphyrin III and the red pigment porphoben, which are specific for acute porphyria The barbiturates can apparently provoke attacks of acute porphyria and aggravate existing attacks The grave prognosis of the disease is ascribed to the extensive use of barbiturates (Waldenstrom) Chemical diagnosis is simple. If the urine is alkaline the colorless porphobilinogen will not cause formation of pigments, and acute porphyria may be present although the urine is of normal color In the 2 cases of latent porphyria reported the excretion of porphobilinogen was demonstrated by Vahlquist's method

# Book Notices

**Manual of Diagnosis and Management of Peripheral Nerve Injuries** By Robert A Groff M D Lieutenant Colonel M C A U S and Sara Jane Houtz R S With an Introduction by I S Ravdin M D Brigadier General M C A U S Cloth Price $6 Pp 188 with 111 Illustrations Philadelphia London & Montreal J B Lippincott Company 1945

This short manual on peripheral nerve injuries is divided into two major portions In the first division the authors present a conventional review of most of the facts known about the anatomy and physiology of peripheral nerves, the reactions of injured nerves, the surgical repair of nerve injuries and the details of nerve recovery and regeneration This portion is well written and useful but adds nothing to the existing literature on peripheral nerve injuries, at the same time it is felt that important subjects such as causalgia and the regeneration of nerves following repair are too briefly dismissed In the discussion of electrical reactions following nerve repair no mention is made of the important contribution of Pollock and his co-workers on cathode tetanus ratios The second part of the manual, however, is highly useful and original It is a graphically illustrated, page by page presentation of the functions of all the peripheral nerves, with an easily understood visualization of the technics used in the testing of the involved muscles There are in addition a number of clear and accurate illustrations showing surgical dissections in the more commonly encountered areas of peripheral nerve injuries This portion of the book is a true contribution to the literature on peripheral nerves and may be recommended to surgeons general practitioners medical students and physical therapists as a valuable aid in the diagnosis of peripheral nerve injuries

**The Tissues of the Body An Introduction to the Study of Anatomy** By W E Le Gros Clark F R S Dr Lee's Professor of Anatomy in the University of Oxford Oxford Second edition Cloth Price $7 Pp 388 with 120 Illustrations New York & London Oxford University Press 1945

The author concedes that anatomy is a difficult subject for the beginner, therefore he has been accustomed to introduce the subject by a series of lectures dealing with the organization of living tissues He speaks of 'the fundamental problems of anatomy and the application of experimental methods in the study of structural organization' He quotes Alexis Carrel concerning tissue culture as 'the most important event in the history of anatomy' By interesting the student in the problems of anatomic research the author hopes to stimulate his intellect and open new pathways of inquiry Medical students in the first and second years do not have "the graduate student outlook" but are concerned with soaking in as much dissection and descriptive anatomy as possible. The proper way to study anatomy is to recognize it as a difficult yet basic factor in the life of the doctor and to buckle down to the mastering of these difficulties There is no royal road, no short cut, no Berlitz method The author's style seems rather dry and heavy instead of achieving the 'stimulation" desired

**Jobs and the Man A Guide for Employers Supervisors Interviewers Counselors Foremen and Shop Stewards in Understanding and Dealing with Workers—Veterans or Civilians** By Luther E Woodward Ph.D Field Consultant Division on Rehabilitation National Committee for Mental Hygiene and Thomas A C Rennie M D Associate Professor of Psychiatry Cornell University Medical College New York. Fabrikoid Price $2 Pp 132 with 2 Illustrations Springfield Ill Charles C Thomas 1945

Today proper placement of workers in industry is being more successfully achieved than ever before because of the development of new technics In this informative book the principles of job placement are clearly stated. Many are concerned in the problem of understanding the worker and assigning him to suitable tasks, and this book is written so that foremen, shop supervisors, employees and counselors can read it with profit and understanding Attention is directed to the difficulties of handling returned veterans in industry, and a thoughtful solution is offered to the problem of rehabilitating the man with a neuropsychiatric history Physicians will find much of interest in the discussions on interviewing workers who have returned from military service and will learn something of their difficulties in resuming a place in industry A brief summary of the likely obstacles encountered by some veterans in learning the ways of peace in the home, in society and in a new job is succinctly stated Proper placement of the worker is of benefit both to the individual worker and to industry Job satisfaction is an important part of every one's life, and it assumes a major role in the development of a healthful mental attitude toward life The family doctor can be helpful in guiding the maladjusted to seek and secure work that will make them good workers with a happier view of life. Estimates indicate that 10 per cent of the population have serious emotional difficulties and that 20 per cent would derive benefit from counseling and guidance It is regretted that the authors did not fully recognize the help given patients by many family doctors in the solution of perplexing problems of proper placement and the derivation of work satisfaction The book is a valuable guide to all who deal with workers in the present complex industrial life.

**Arteriosclerosis A Chemical and Statistical Study** By Jóhannes Björnsson Denne Afhandling er af det lægevidenskabelige Fakultet antaget til offentligt at forsvares for den medicinske Doktorgrad Kjøbenhavn The translation into English by Robert Fraser Paper Pp 249 with 4 illustrations Copenhagen Einar Munksgaard 1942

This work presented as a thesis for a doctor's degree, attempts to support or refute the clinical impression obtained from postmortem examinations that arteriosclerotic disorders are much rarer in Iceland than in Denmark. The first third of the book is devoted to a critical review of the earlier reports of the prevalence of arteriosclerosis in various previous series The author points out that wide discrepancies between different series are due to variations in age and sex distribution and environmental factors such as city and country life, which in turn affect materially the opportunity or desirability for hospitalization and for postmortem examination Patients with arteriosclerotic conditions are likely to die suddenly or after a short illness and are therefore much less likely to be hospitalized in rural districts than in city areas, in Iceland than in Denmark. Statistics based on postmortem examination cannot be accepted as reliable because the incidence of arteriosclerosis depends on many unrelated factors Furthermore, diagnosis and severity of involvement often depend on personal judgment, which is difficult or impossible to standardize. Other criteria for diagnosis such as blood pressure measurements, x-ray examinations and palpation of arteries are not reliable or comparable from one series to another

The author attempted to develop a quantitative chemical method of evaluating and classifying arteriosclerosis depending on correlation of chemical with anatomic findings He examined 382 nonsyphilitic aortas from Vienna and found no consistent agreement between the macroscopic and the chemical involvement. The latter was judged by the cholesterol and calcium content of dried and powdered aortas after removal of the adventitia. He also studied the mortality statistics from Iceland and Copenhagen After complicated corrections and analyses he concludes that deaths from arteriosclerotic diseases are just as common in Iceland as in Copenhagen Any apparent differences seen in crude death rates are due to different facilities for and conditions of hospitalization in the two communities

The thesis was originally written in Danish The translation is somewhat awkward but is quite understandable The book contains tables of 200 cases from Copenhagen and Vienna and 130 from Iceland giving the age height, weight, blood pressure, diagnosis and cause of death, macroscopic description of the aorta and cholesterol and calcium content of each aorta. The volume describes a tremendous amount of work. One wonders whether the same conclusions might not have been justified and reliable after a smaller number of determinations

**The Principles and Practice of Rectal Surgery** By William B Gabriel M S F R C S Surgeon to St Mark's Hospital for Cancer Fistula and Other Diseases of the Rectum London Third edition Cloth Price 45s Pp 432 with 248 Illustrations London H K. Lewis & Co Ltd 1945

In this book, which is the third edition since 1932, there are 17 chapters with 237 illustrations and 11 colored plates Chapter II contains a short and incomplete discussion of "proctitis," and chapter XVI is entitled "Carcinoma of the Anus and Anal Canal" These chapters are new and apparently are the reason why a new edition was considered necessary because, with few other exceptions, the remainder of the book is identical with the second edition, which appeared in 1937

## HYPERTENSION

*To the Editor* —Is there anything specific for hypertension?

Lena A. G Miller M D Napa Calif

ANSWER.—There is no specific medication curative of hypertension Nor are there any specific curative surgical procedures Hypertension per se is not a disease but a symptom or biologic response to continued and excessive arteriolar stimulation The sources of such stimulation or irritation differ in each and every instance of the disorder Therefore no 2 cases of hypertensive arterial disease should be treated identically curative therapy invariably is dependent on eradication or amelioration of etiologic factors, and these are extremely variabl It can be predicted that no one will ever find the cause of hypertension, simply because there are many causes Similarly it is highly improbable that any 'specific" curative therapy generally applicable to all or most cases of the disease will be discovered in the future

This discussion does not imply that there are no useful drugs effective in the treatment of hypertensive disease There are many medicaments which have great usefulness in the control of hypertension, each with specific and limited indications These drugs may be classified under several headings

1 Sedatives, to reduce central nervous system tension
2 Vascular antispasmatics including
   (*a*) Soluble nitrites (amyl nitrite, sodium nitrite) and soluble organic nitrates (glycerol trinitrate, erythrol tetranitrate, mannitol hexanitrate)
   (*b*) Insoluble nitrates (bismuth subnitrate)
   (*c*) Potassium thiocyanate
   (*d*) Certain tissue extracts
3 Cardiac drugs
   (*a*) Digitalis and allied substances
   (*b*) Theophylline and allied derivatives
4 Antianemia medications

Certain surgical procedures, particularly the Smithwick operation, designed to sever the vasomotor trunks and thus reduce the vascular hypertonia, are effective in certain instances However, these operations admittedly are only palliative. The neurosurgical approach fails in that it does not take cognizance of the primary etiologic factors responsible for the disease, it merely destroys one of several physiologic mechanisms concerned with the maintenance of vascular tone. A few, but only a few, instances of hypertension are secondary to unilateral renal disease, and a still smaller number are due to tumors of the adrenal gland. Surgical, like medicinal, therapy must be guided by etiologic analysis

## EFFECT OF IRRADIATION OF OVARIES ON SUBSEQUENTLY CONCEIVED OFFSPRING

*To the Editor* —A woman was operated on for a cystic ovary two and a half years ago She had a chocolate cyst with endometrosis A year later she had six x ray treatments which stopped her menstrual periods for nine months She has been menstruating at twenty four day intervals for the past nine months What are the possibilities of her having a deformed or mentally deficient child if she becomes pregnant now? How long after x-ray treatments over the ovaries before such treatments will have no effect on the child? John T Murchie, M D, Portsmouth Ohio

ANSWER.—At present, proof that irradiation of the ovaries before conception takes place has any effect on the children born subsequently to the irradiated woman is lacking In animals, on the other hand, the matter of irradiating the ovaries has been subjected to experimental study J P Greenhill (Year Book of Obstetrics and Gynecology, 1940, p 681) says "The question of the safety of irradiation of the ovaries is by no means settled Many of those who use this form of therapy to overcome amenorrhea and sterility are enthusiastic about their results and claim the procedure is harmless If we can apply experimentation in lower animals to human beings, then irradiation of the ovaries may be of distinct harm" Muller in 1926 subjected both male and female fruit flies to varying doses of x-rays The treated flies were then bred to untreated males, and at the same time numerous control matings of the same genetic type consisting of untreated males crossed with untreated females were carried out for comparison Muller said "The results in these experiments were startling and unequivocal—it was found that the heaviest treatment had increased the frequency of mutation about 150 times, an increase of 15,000 per cent" Muller emphasizes that if human beings are affected by x-rays in the same way as flies, one cannot expect to find much evidence of a mutational effect of x-rays on them from data derived only from the first or even the second and third generations But such a negative result will therefore by no means indicate a lack of significant genetic effect. Muller pointed out that all the principles of heredity so far described in the fruit fly have proved applicable to animals and plants in general

However, in the 1943 Year Book of Obstetrics and Gynecology page 508, Greenhill says "In the past I, among others have urged great caution with low dosage irradiation because of the reports in the literature, chiefly those of Muller, of serious harm to the offspring in the third and fourth generations in various species of animals In human beings the offspring have been normal, but as this treatment is less than 20 years old no one knows what will happen to the third and fourth generations However, in a personal communication William Snow writes he calculated that according to Muller all life should have been destroyed by cosmic irradiation since in a million years about 50,000 roentgens of such energy reached the earth's surface, as judged by the Geiger-Muller readings We must conclude therefore that there must be a recovery of the genes Gordon and Sang have prevented with niacin fruit fly mutations induced with irradiation According to Snow, this is practical proof that the genes can recover from radiation injury'

The conclusion to be reached from these statements is that harm has not appeared in the first generation of children born after irradiation of the ovaries, but irradiation during pregnancy often results in malformation of the child in utero

## COAGULATION TEST BEFORE CIRCUMCISION

*To the Editor* —Is there any value in doing a routine coagulation test on infants prior to circumcision? Is this procedure routine in the majority of our best hospitals? Harvey G Bland M D Newport News Va

ANSWER.—It is well worth while. Preferably a coagulation test should be done on every patient before any operative procedure even minor surgery, is done. As far as is known coagulation tests are not done as a routine measure prior to circumcision in the majority of hospitals

## ASCENDING PARALYSIS AND UREMIA

*To the Editor* —In a case of uremia due to chronic nephritis there developed terminally an acute ascending paralysis and a motor paralysis with varying degrees of pain over the entire body and neck preceding this there was some fever of about 100 to 102 F There were no convulsions, and the patient was conscious until a few minutes before death The question is Is this rather typical Landry's paralysis a frequent occurrence in uremia? Could there have been the two disease entities either or both producing death? I can find nothing in the literature relative to this relationship Kindly elucidate if possible M D South Dakota

ANSWER.—An acute ascending paralysis of the Landry type as a terminal event in a patient with uremia from chronic nephritis is practically unknown. There seems to be in this case, however, no reason to doubt the diagnosis, for the absence of sensory loss excludes acute ascending myelitis, and acute poliomyelitis or acute toxic polyneuritis is untenable as a diagnosis Landry's paralysis is encountered in influenza, typhoid, pyogenic infections, food poisoning, tick bites, postvaccinal and postexanthematous disease, rabies and diphtheria The etiologic agents are indeed varied Toxic uremia of chronic nephritis may well be added to the list, if other causes can be excluded by a complete study of the case.

## REACTION TO PENICILLIN

*To the Editor* —I wish to report a personal experience with the use of penicillin Having read of the use of a fine spray of the solution in the treatment of infections of the respiratory tract, I decided to try it for laryngitis The solution was made up of 0 1 Gm of the sodium salt in 50 cc. of isotonic solution of sodium chloride It was used in a nebulizer Probably 2 cc. was used for the first and only treatment On the following morning my lips were swollen and red Later in the day fine vesicles developed accompanied by considerable burning and itching There was desquamation on the third day The appearance was similar to dermatitis venenata. There is a possibility of developing angioneurotic edema involving the pharynx and larynx if treatment is continued The symptoms might be confused with those of progression of the original disease process John C Urbaitis M.D Warren Pa

## SOME CONTRIBUTIONS FROM THE SISTER SCIENCES

KARL T COMPTON, PH D
Cambridge Mass

No branch of science or art furnishes a more striking example than does medicine of the fact that increasing specialization is necessarily accompanied by increasing interdependence and cooperation among the specialized fields In the early days all the sciences were combined together, frequently in the same individual Later the various specialties had a tendency to run their separate courses Now we find them coming together again for mutual support It is something like the story of the prodigal son, who, after the adventures of an independent career, is glad to come back again to his family

This is well illustrated by the development of the significance of the word "physics," which in the original Greek meant "that which pertains to nature" It was used to designate those phenomena of the natural or material world as contrasted with things mental, or moral, or spiritual, or imaginary Originally the word referred to all living things, including the human body, as well as to phenomena of the inanimate world Later it took on more specialized meanings but always retained this twofold aspect, on the one hand relating to the inanimate world and on the other to the human body We still find in Webster's dictionary two definitions of a physicist The first definition given is "one versed in medical science" The second definition is "a specialist in the natural sciences" One who follows my profession of physicist is in France called a physicien, while in English the word "physician" means a medical practitioner Similarly in Germany I would be called a physiker, whereas in English-speaking countries a physicker is one who administers a physic But whereas those words which have the same original root have followed these two lines of continually narrowing significance, the progress of modern science is in many ways bringing the two together because on every hand the natural scientist is bringing more and more to the service of the physician his increasing knowledge and control of the materials and forces of nature

The contributions of the sister sciences to medical science and art have in part been in the nature of tools and materials and in part been a better understanding of the fundamental structure and functioning of the human body From physics, for example, have come such tools as the thermometer, stethoscope, electrocardiograph x-ray, and a host of other devices ranging all the way from mere gadgets to highly complicated instruments From the chemist have come such materials as most of the ordinary medicines and drugs in enormous variety, radium and synthetic vitamins From the physiologist and biologist has come the more detailed knowledge of the structure and functioning of the human body The psychologists are contributing their share in untangling the complicated relationship between mind and body

The past history of the Rockefeller Foundation offers a good illustration of the importance which thoughtful students of medical science attach to the sister sciences This foundation has always attached the greatest importance to the advancement of medical science About twenty-five years ago, just after World War I, it came to the conclusion that a very important method for the long-term advancement of medical science was the more adequate support of research in the physical and biologic sciences, and this decision was implemented by the great program of National Research fellowships and of grants to support research in the various sciences This and similar programs by various agencies have paid dividends in a large way for out of such activities have come, in the past decade, such things as the sulfonamide drugs, DDT, synthetic vitamins, high voltage x-rays, various forms of radiation therapy, radioactive tracer studies and many other medical applications

Out of this great variety of new contributions to medical science I would describe in brief detail just a few examples which seem to me to illustrate some of the more important trends and developments These examples are chosen from activities with which I have had some direct or indirect contact, and I make no claim that they are selected with any priority of importance among many other illustrations which some one else would be better qualified than I to describe However, they are certainly important and are indicative of the trend of things to come

### ARTIFICIAL LIMBS

To the uninitiated there would seem to be nothing new about artificial limbs The genial ruffian John Silver in Robert Louis Stevenson's "Treasure Island" thumped around on an artificial leg The more modern artificial legs are more shapely and are likely to have articulated joints However, they have been far from adequate replacements for the functioning of the natural limb

During the past war for the first time in history, so far as I know, there has been mobilized a cooperative organization composed of medical men manufacturers of surgical equipment, physiologists, physicists, skilled instrument makers and inventors in an effort to bring all available knowledge and art to bear on the problem of

Read before the New England Hospital Assembly March 12 1946

creating artificial limbs which will as nearly as possible permit a crippled person to move, act and manipulate in normal fashion Organized under the Office of Scientific Research and Development, this group is headed by Dr. Paul E Klopsteg, a physicist, formerly head of the Central Scientific Company and now in charge of graduate study and research in the Technological Institute of Northwestern University One problem has been the design of artificial legs which have joints with the proper combination of flexibility and stiffness at the appropriate angles to permit walking upstairs or downstairs Another problem is the design of artificial hands which can be turned and whose fingers can be manipulated through cords attached to muscles in the stump It is already evident that this combined effort is bringing about a very decided advance in the design of artificial limbs Though instigated to meet one of the unfortunate conditions resulting from the war, it is a fact that the number of annual amputations resulting from accidents in peacetime considerably exceeds the number of similar war casualties, and it may therefore be said that the focusing of expert attention on this problem at this time should be reckoned as one of the useful results of the war

### SOME PROSPECTS IN BIOLOGY

My colleague Professor Francis Schmitt likens the present prospect in biology to that which faced the physicists and chemists in the early days of this century when it had been discovered that the atom, hitherto believed to be indivisible and in fact so named, had been proved to have a structure of electrical components held together by complex forces First the exterior electronic structure of the atom and then the inner nucleus of the atom itself have been explored, and all the modern knowledge of spectroscopy, ionization, isotopes and atomic energy has developed with startling rapidity to usher in a new era of physical science Similarly, the development of new experimental tools such as the ultracentrifuge, the electron microscope and the use of radioactive tracer materials is making possible a new type of quantitative biology far more powerful than the older descriptive biology and beginning to yield significant information regarding the ultimate constitution and fine structure of living matter There is every reason to believe that these developments of quantitative biology are ushering in a new era for the understanding and ultimate control of fundamental life processes Let me give a few illustrations which are suggestive of things to come

Dr Avery and his co-workers at the Rockefeller Institute have isolated nucleic acid from the capsule which surrounds the pneumococcus There are several dozen strains of pneumococci and they seem to owe their specific characteristics to substances in the capsule The capsule can be removed, leaving an organism which, though still alive, is avirulent until a new capsule is formed If purified nucleic acid which has been isolated from one strain is added to the decapsulated cocci of another strain, the resulting bacteria show the genetic and pathogenic properties of the strain from whose capsules the nucleic acid was prepared A predictable genetic mutation appears to have been produced Geneticists have sought in vain to accomplish this in higher organisms This is a model of the action of genes, which are also supposed to contain nucleoproteins However, in the case of the capsule nucleic acid the material is a purified compound The ability of viruses and cell constituents to reproduce themselves is closely correlated with the presence of nucleic acid This experiment of Avery suggests that the nucleic acid, possibly in combination with a specific protein, acts like a gene

In the last century it was supposed that enzymes could never be isolated in active form from living cells Now we know that enzymes are protein molecules which can be isolated, purified and studied, physically and chemically Will this history repeat itself in the case of genetic determiners, the genes? Will it be possible to determine genetic characters of forms higher than bacteria by administering isolated "genes" or gene activators representing such characters?

As another example, consider substances which have antibiotic action There are certain substances which have no toxic effect on body cells but which inhibit the reproduction of micro-organisms. Under such conditions the organisms may increase in size but they do not reproduce This has already had immense medical significance Moreover, when the structure of a few antibiotics is known, as, for example, penicillin or streptomycin, the organic chemist may alter various groups in the molecules and hope to produce synthetic antibiotics for various diseases for which no natural antibiotic has yet been found

Another example is the competitive inhibition of enzyme reactions An enzyme has chemical groupings by which it can cause specific alterations in certain substrates If a substance closely related to the specific substrate is added to the enzyme, the active groups of the enzyme combine with the substance and the enzyme is effectively poisoned If the specific substrate itself is added, no reaction occurs For example, there is an enzyme (cholinesterase) which splits acetylcholine, a powerful nerve stimulant and the hormone which produces smooth muscle contraction If a tissue is treated with physostigmine, which contains a chemical group similar to that of acetylcholine, the enzyme is poisoned Physostigmine has been used pharmacologically for years, but the mechanism of the action has only recently been discovered Along this line a number of investigators have been trying the effect of a variety of compounds closely related chemically to the normal food substances used by bacteria in the hope that they may, by competing with these substances for the enzyme molecules, starve the bacteria to death

A final example in this field is the development of new technics in the use of the electron microscope which make this instrument even more powerful in the study of biologic material Fine structure in certain fibrous proteins has already been discovered and many protein molecules, such as the albumins, globulins and fibrinogen, in blood may soon be visualized directly In the past these molecular shapes had to be deduced by indirect methods Now that it is possible to visualize these molecules directly, a whole new era is opened up for the discovery of various biologic entities such as viruses responsible for certain diseases By this means during the war the viruses of influenza were isolated and photographed, and their chemical composition has been determined

Enzymes and chromosomes can now be observed directly with the electron microscope, and it appears possible thus to determine the physical basis of the gene mechanisms determining heredity

By these illustrations I would not wish to imply that all these problems have been solved What I wish to point out, however, is that new and very powerful technics of investigation have been developed sufficiently to offer a strong feeling of optimism that we are now on the threshold of a period in which knowledge of a most fundamental and important character will be secured in the realm of fundamental biology with applications to medicine

It is this type of fundamental knowledge which probably forms the most promising basis of the great cooperative attack on cancer which is now being organized A considerable portion of the funds collected by the American Cancer Society are scheduled for administration by the Committee on Growth of the National Research Council to mobilize all the resources of physics, chemistry and biology for this investigation It is fortunate that those directing the use of the cancer money realize the importance of fundamental research if there is to be any hope of securing a really significant answer to the cancer problem or to any of the other complicated and obscure problems of disease and health

### SOME EXAMPLES FROM PHYSICAL SCIENCE

I have already mentioned important medical tools like the thermometer, stethoscope and x-ray, which have been contributed from the physical sciences and which are so widely used as to have become commonplace However, there are new contributions at hand or in sight of great significance of which I shall give only a few illustrations

Radium and x-ray therapy of cancer have been practiced for several decades It is only about one decade, however, since the more penetrating x-rays produced at voltages of a million or more have become available for use as a by-product of the physicist's development of high voltage generators for experimentation on the artificial transmutation of atoms There is still another exceedingly promising prospect involving a modification of this x-ray technic, however, namely the therapeutic use of the high speed electrons, or cathode rays themselves, instead of the x-rays which they would produce on striking the target of an x-ray tube In other words, the proposal is to shoot the high speed electrons directly into the living tissue instead of irradiating this tissue with x-rays In either case the biologic or therapeutic action is produced by the same mechanism, namely by the bombardment of the living cells by the secondary electrons produced within the tissues As far as this therapeutic action is concerned, it makes no difference whether the secondary electrons have been set in motion by x-rays or by high speed cathode rays However, it may make a great deal of difference to the patient because of a very curious characteristic of cathode rays as they pass through matter

Cathode rays produce relatively few secondary electrons when they are moving with high speed, and they produce most of the secondary electrons after they have been slowed down and just before they have stopped in passing through the absorbing material The significance of this fact in cancer therapy is suggested by the following example Suppose that it is desired to treat a cancer which is located about 1 inch beneath the surface of the abdomen Electrons or cathode rays produced by a 5 million volt machine are able to penetrate the body to a depth of about 1 inch If these therefore are directed into the abdomen in the direction of the cancer to be treated, they produce few secondary electrons and therefore little biologic effect near the surface where they enter, but they produce the maximum number of secondary electrons and therefore deliver their maximum therapeutic dose at the depth of about 1 inch, just before they come to rest This gives a method of concentrating a dose of therapy at any desired depth within the body with a minimum of erythema or biologic action in the path of entrance and with no biologic action in the region deeper than the desired location The traditional method of x-ray therapy, on the contrary, has a disadvantage, as far as depth dosage is concerned, in that the maximum dosage is greatest at the point where the x-rays enter the body, and the dosage decreases with depth

Of all the new physical-chemical tools, however, the one which seems to me to have the greatest promise in the medical field is the use of artificial radioactive substances, either as tracers or as therapeutic agents, and I would give two examples which are suggestive of a wide variety of applications on these matters

Some ten or a dozen years ago Dr Means and his colleague Dr Hertz of the Massachusetts General Hospital and the Harvard Medical School became interested in the possibility of using radioactive iodine for the localized therapy of the thyroid gland, especially in cases of such a disorder as toxic diffuse goiter They did this work in collaboration with Professor Robley Evans, who is in charge of the Massachusetts Institute of Technology cyclotron program and the outstanding scientist in this country in the use of radioactive tracer materials and the quantitative measurement of minute quantities of radioactivity

Some experiments were first made to see how much iodine would be absorbed into the thyroid gland from the blood stream and how fast it could get there The radioactive iodine was prepared with the cyclotron, and the early experiments were carried on by injection into rabbits It was found that within about five minutes all the iodine that could be absorbed by the thyroid gland had been thus absorbed and that, in proportion to the size of the thyroid gland, from twenty to two hundred times as much iodine went to the thyroid gland as to any other organ or tissue of the body If the rabbit had been on an iodine starvation diet, or if the rabbit had a case of spontaneous goiter, or if it was a pregnant female the higher values of iodine absorption in the thyroid gland were observed All the quantitative measurements were made with the use of the Geiger counter, that marvelously sensitive instrument which, through ionization of the surrounding air, can detect the presence of radioactive iodine and measure its amount, atom by atom

Later, similar experiments were carried on with human beings and they have been continued by Dr Chapman, in collaboration with Drs Means and Evans since Dr Hertz entered the Navy early in the war Having determined the quantities of iodine absorbed in the thyroid gland, the next step was to introduce quantities of radioactive iodine of sufficient amount to have localized therapeutic value because of the radioactive radiations admitted locally from the iodine right in the thyroid gland itself I understand that upward

of two dozen patients have been thus treated with good results

This is one illustration of the several possibilities which have been envisaged for the therapeutic use of radioactive materials which can be manufactured with the cyclotron and which have the characteristic of specifically large absorption in certain organs or tissues of the body

My other illustration has to do with the use of radioactive chemical elements as tracer materials, in which their radioactive properties and their resultant capability of detection by a Geiger counter make it possible to determine accurately and quantitatively the location of these materials at any subsequent time If, for example, one takes a drink of water containing a little ordinary salt whose sodium has been made radioactive in a cyclotron, it is possible with a Geiger counter to determine how soon this salt has passed through the walls of the stomach into the blood stream and reached any part of the body

The most interesting recent example of this technic was in the studies of surgical shock and the development of technics for the preservation of whole blood for transfusion during the war This work was carried on under a basic contract between the Committee on Medical Research of the Office of Scientific Research and Development and the Massachusetts Institute of Technology and was a cooperative enterprise involving also the Massachusetts General Hospital, the Harvard Medical School and the Peter Bent Brigham Hospital The work was in charge of Dr John Gibson, Dr Joseph Aub and Professor Robley Evans The program was supplemented by work also by Dr Ross of the Evans Memorial Hospital, Dr Denstedt of McGill University, Dr Strumia of the Bryn Mawr Hospital and others, all of them utilizing the materials produced by the Massachusetts Institute of Technology cyclotron and the radioactive measurements by Professor Evans and his colleagues

Radioactive iron was the material used because of its importance as a constituent of hemoglobin Two types of radioactive iron were used, one manufactured with the cyclotron by bombardment of cobalt, and the other by the bombardment of manganese, and the two types could be distinguished in subsequent measurements by the fact that the former lost its radioactivity at the rate of one half in five years, and the other at the rate of one half in forty-seven days

When experiments on blood transfusion were carried out, one of these radioactive forms of iron was injected into the recipient of the blood transfusion so as to tag his own red corpuscles and the other type of radioactive iron was injected into the blood donor so as to tag the red corpuscles of the blood used in the transfusion By this means one type served as the control and the other type served as the experimental blood donor source

By these technics several extremely important investigations could be carried out One had to do with the reaction of the various blood types on one another It was possible, for example, to find out whether blood from a group O donor with a high anti-A titer, when transfused into a recipient with a different blood type, lost its potency in the presence of the second type, or vice versa By this method some new discoveries were made regarding the interaction of blood types which greatly safeguarded blood transfusion and which have been proved to have application in certain situations in childbirth as well as in surgery

But the greatest wartime contribution of this method was for determining the best methods for preservation of whole blood and for setting up the technical standards for the great blood donor program By the device of using the tagged iron atoms in the donor's blood, direct evidence could be obtained regarding the potency of this blood after various durations of storage at various temperatures when admixed with various suggested preservatives All that it was necessary to do at the end of any given storage period was to transfuse this blood into a recipient and shortly thereafter determine the amount of the donor's blood which still remained active in his blood stream It was by this method that there was established the national standard specifying that after twenty-one days of storage at least 70 per cent of the transfused red cells must remain in circulation of the recipient for at least twenty-four hours

## GENETIC CHANGES

During the past decade or two an increasing amount of interest has been focused on the genetic changes which can be produced by x-ray or neutron radiations The best known example is that of the drosophila or fruit fly, which, after exposure to x-rays, has a certain probability of producing new species characterized by red eyes or other new characteristics One of the most interesting illustrations has been the production of new species of plants by strongly irradiating the germinating seeds with x-rays In this way a new type of tobacco plant with a 13 foot leaf has been produced, as one of many examples of agricultural possibilities

To the medical profession this phenomenon is of interest because of the possibility that by action of x-rays, neutrons or other high speed particles new types of biologic materials may be produced These may be new types of dangerous germs, as, for example, new variations of influenza, or conversely they may be new types of beneficial medical material, derived, like penicillin or herb extractions, from living matter Experiments have gone far enough to prove that there are possibilities along these lines and to suggest that there may here be an enormous field of importance to medical science of which we are just on the threshold

This field was opened up by x-rays and cyclotrons Probably the great uranium piles which have been designed in connection with the atomic bomb development and which give off enormous quantities of radiation may supply a new radiation tool for medical science It may be possibilities of this general type which are suggested when we hear that the new developments in the production and control of atomic energy have potentialities in agriculture and medicine as well as in mechanical power and warfare

## CONCLUSION

I hope that these illustrations, selected more or less at random, may serve to suggest the possibilities which apparently lie ahead in the near future as goals for those scientists in the various fields who would cooperate with medical science in advancing our knowledge of living processes and developing still more powerful arts of medical science

# RADIOACTIVE IODINE IN THE STUDY OF THYROID PHYSIOLOGY

## VII The Use of Radioactive Iodine Therapy in Hyperthyroidism

SAUL HERTZ, M D
Boston
and
ARTHUR ROBERTS, Ph D
Cambridge, Mass

In previously published experiments of this series [1] radioactive iodine was used as an indicator in the study of animal and human thyroid physiology and iodine metabolism Much of this preliminary work was done with a view to the discovery of the conditions under which radioactive iodine might be administered with maximum radiational effect in the pathologic thyroid of patients ill with hyperthyroidism The present paper is a progress report on our early experiences (1941-1946) with such "internal irradiation" in the treatment of 29 cases of hyperthyroidism It is, indeed a three to five year follow-up report on these cases

### PROCEDURE

Patients were selected who had had no previous iodine treatment and who were judged clinically to have hyperthyroidism The usual clinical tests were made and the patients were presented to the Thyroid Clinic of the Massachusetts General Hospital for discussion and determination of their suitability for this type of treatment In each instance a dose of radioactive iodine, which had been made by the cyclotron at the Massachusetts Institute of Technology or by the Harvard University cyclotron, and separated chemically as sodium iodide, was then orally administered

The samples of radioactive iodine used were obtained by deuteron bombardment of tellurium and at the time of administration consisted of a mixture of different radioactive isotopes of iodine Over 90 per cent of the activity at this time consisted of the 12 6 hour isotope $I^{130}$ and most of the remainder of the 8 day isotope $I^{131}$ The total activity administered varied between 0 7 and 28 millicuries In 19 cases the total dose was administered to the individual patients as one dose, in 10 cases divided dosages were employed

From the data already obtained from tracer studies it was considered desirable to keep the total amount of iodide administered below 2 mg of iodine in order to insure maximum collection by the thyroid

Urinary iodine excretion was determined during the first seventy-two hours after the administration of radioiodine. An indirect estimate of the thyroid retention of radioactive iodine was thereby obtained, since an approximate balance exists between administered iodine on the one hand and the sum of thyroid iodine retention and urinary excretion on the other

Urinary studies were carried out on aliquot portions of carefully collected twenty-four hour specimens, which were kept iced and corked during the collection periods

It was early found [2] that significant amounts of the original dose were to be found only in the first three days' specimens Fecal excretion was tested and was found to be so low as to be negligible for the purpose of these experiments

In a few cases external gamma ray counter measurements were made of the activity of the thyroid of patients following the administration of radioactive iodine Such measurements are difficult, for obvious reasons, to evaluate quantitatively However, day to day measurements of this type can give good data on the variation of thyroid iodine content They were performed in order to follow the loss of iodine from the thyroid following the initial uptake and to evaluate the effect of routine iodinization following the administration of radioactive iodine

External counter measurements were roughly calibrated against actual direct measurements on the thyroid glands at operation and after chemical separation [3] in 2 patients, previously scheduled for surgery, who received therapeutic amounts of radioactive iodine

Following the administration of radioactive iodine routine iodine (nonradioactive) in the usual dosage of saturated solution of potassium iodide 5 minims (0 3 cc ) twice a day was begun at periods varying from one day to several weeks after the radioactive iodine dose

The basal metabolic rate of the patients treated was tested frequently both before and after the radioactive iodine administration Basal metabolic levels were taken prior to treatment to establish a measure of the degree of thyrotoxicosis present In addition to the basal metabolic rate, weights, pulse rates and physical findings were recorded and the total clinical picture was used to evaluate the effects of treatment No adverse effects, such as fever, nausea or irradiation sickness, were noted in this series of patients No complaints were recorded regarding the taste of the medicament (since it is tasteless), nor were any local effects, either in the oral cavity or over the thyroid, encountered at the dosage levels used No increase in the degree of thyrotoxicosis following the radioactive iodine treatment, per se, was recorded, although several test patients were kept uniodinized for three to four weeks prior to routine iodinization

In most cases, after a period of two to four months following the radio-iodine administration, routine iodine therapy was stopped when an essentially normal basal metabolic rate had been maintained on iodine for a few weeks or months Such basal metabolic rate response was taken to be indicative of good control of

---

A report to March 15 1946

From the Thyroid Clinic and Metabolism Laboratory of the Massachusetts General Hospital and the Radioactivity Center Massachusetts Institute of Technology This material was presented in part to the American Society for Clinical Investigation in May 1942 (see abstract of proceedings Physiol Rev 62 4 1942) The work was aided by a grant from the John and Mary R Markle Fund in the names of Professors J H. Means and Robley D Evans and was accomplished by close cooperation of the Radioactivity Center of the Massachusetts Institute of Technology Cambridge Mass and the members of the medical staff of the Massachusetts General Hospital Boston.

This work was performed at the Massachusetts General Hospital and the Massachusetts Institute of Technology under a grant from the John and Mary R Markle Fund Cooperation and assistance in this work were given by Professor J H Means Professor J W Irvine, Dr Wendell C Peacock, Professor M Stanley Livingston Professor Robley D Evans Drs R W Rawson and Jacob Lerman the technical assistants Mrs. Phyllis Brown Shattuck Miss Ann Gaurdo and Miss Mary Lennon as well as the nursing surgical and medical staffs of the Massachusetts General Hospital The speech of President Karl T Compton of the Massachusetts Institute of Technology before a Harvard Medical School colloquium in the fall of 1936 served to inspire the senior author in the initiation of this investigative program

the thyrotoxicosis at that time Failure of the basal metabolic rate to rise on the cessation of iodine treatment was then interpreted as positive evidence of remission of the disease A rise of the basal metabolic rate on cessation of iodine therapy was considered evidence of failure of the regimen of internal irradiation A lowered basal metabolic level, with weight gain, symptomatic relief and lowered pulse, were considered indicative of a decrease of the severity of the disease

As with other forms of treatment for hyperthyroidism, a prolonged follow-up of six months to one year (or more ideally two to five years) following, clinical evidence of remission was required before classification of cases as "cures"

## CALCULATION OF RADIATION DOSAGE

In order to obtain a basis of comparison among patients and between radioactive iodine on the one hand and x-ray therapy on the other, the probable values of radiation dosage delivered in the thyroid were calculated Such calculations are based on the following data

1 Fractional uptake of radioactive iodine by the thyroid

2 The known energy of the radiations from $I^{130}$ and $I^{131}$

3 The clinical estimation of the weight of the thyroid of the patient.

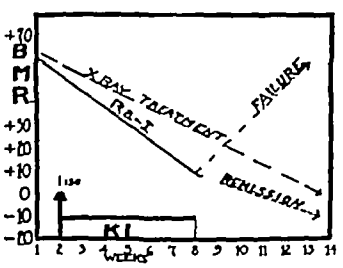
4 The known pattern of uptake and retention of radioactive iodine [3] by the hyperplastic thyroid gland of hyperthyroidism [2]

By using the known values of ionization produced by 1 millicurie of radiation and the properties of $I^{130}$ and $I^{131}$ the following formulas can be derived for the total radiation delivered in decaying to zero

$$\text{Radiation (in roentgen units)} = \frac{10\,000 \text{ (dose of } I^{130} \text{ in mc) (fractional uptake in thyroid)}}{\text{weight of thyroid in grams}}$$

For $I^{131}$ the constant 10,000 is replaced by 117,000 Thus for $I^{130}$ a net collection of 3 millicuries in a 30 Gm thyroid will give a total of 1,000 roentgens in decaying to zero [4]

The effectiveness of radiation therapy is known to depend on the rate of delivery, especially at low rates In the case of $I^{130}$ the initial rate of delivery of a 1,000 roentgen dose is 55 roentgens per hour For $I^{131}$ it is only 3 6 roentgens per hour Thus, while in these experiments the total radiations delivered by the two isotopes are comparable, the rate is so much slower for the long-period isotope that its effectiveness is at least open to question Furthermore, an appreciable fraction of the activity leaves the thyroid during the decay of the long period iodine [2] We shall assume throughout that it is the $I^{130}$ radiation which is most effective



Calculations of the type described are subject to large errors These arise mainly in the estimate of the thyroid weight, in the determination of thyroid iodine uptake and in the assumption of a uniform picture of iodine retention - Errors of 50 per cent or more in the estimate of the thyroid radiation are therefore to be expected

## RESULTS

The accompanying graph is a schematic representation of the expected course of the basal metabolic rate in successfully and unsuccessfully treated cases The upper broken line represents the course of the basal metabolic rate of a patient treated successfully by means of orthodox external x-ray therapy The latter is given as a basis for comparison of the time interval required for obtaining a remission by the internal and external forms of thyroid irradiation in typical cases of hyperthyroidism

The results obtained with 29 patients are summarized in tables 1 and 2 Table 1 affords an analysis of 9 cases in which cure was not obtained by the radiational effect of radio-iodine Table 2 gives an analysis for 20 cases considered to be cures These cases are so classified after follow-ups and examinations extending to March 1946

*The excretion studies and the external gamma ray* counter measurements showed early in these experiments that there is no peak in the excretion of iodine in any of 14 cases tested, nor is there any sudden drop in the radioactive iodine content of the thyroid when a patient who has been given radioactive iodine is started on routine iodinization. On the contrary, these experiments showed that iodinization either has no effect on the normal slow loss of iodine from the thyroid or tends to "freeze" the radioactive iodine collected by the gland, i e to foster its longer retention therein As much as 25 per cent of the initially collected radioactive iodine may remain in the thyroid twenty-five days after an initial collection and subsequent iodinization [2] It is clear that such prolonged retention is advantageous from the standpoint of efficient use of the radioactive isotopes administered Urinary studies in a typical case gave the results recorded in table 3

Course of the basal metabolic rate in successfully and unsuccessfully treated cases of hyperthyroidism solid line treatment by radioactive iodine upper broken line treatment by external x irradiation The arrow indicates the point at which $I^{130}$ was administered to the patients treated with radioactive iodine The lower rectangle indicates the administration of ordinary iodides A rise in the basal metabolic rate on omission of iodide therapy is significant of continued thyrotoxicity and failure of the therapeutic program the absence of any such rise in any case is interpreted as evidence of remission of the disease as a result of the type of treatment received by the patient.

The reasons for adopting the procedure of full iodinization following the radioactive iodine dose were, in the main concern, that if the radioactive iodine was not effective the patients might be injured by uncontrolled thyrotoxicosis In addition, no adequate control was possible of the iodine intake of patients (from extraneous sources) while ambulatory and awaiting the radiotherapeutic effect

In spite of the fact that the interpretation with regard to cure might be rendered slightly less unequivocal with the use of this procedure, one can depend on the familiar fact that routine iodinization, per se, has been known for years to be a rather unsatisfactory sole treatment for the great majority of unselected thyrotoxic patients [5]

3 This pattern was determined by the use of tracer quantities of radioactive iodine It is not strictly correct to assume as we have that the pattern will be the same when quantities of activity sufficient to have a biologic irradiation effect on the thyroid are present. However in the absence of other data we have assumed that the pattern is the same If this is in error it will introduce another error into the calculation, already admittedly approximate of the dosage delivered to the thyroid

4 The millicurie values of activities cited in this paper are absolute values based on the number of disintegrations occurring in the radioactive substance determined by methods like those described by Deutsch M, Downing J R, Elliott, L. G Irvine J W, Jr and Roberts A Physiol Rev 62 4 1942.

5 Thompson W O Toxic Goitre The Present Status of Treatment Canad M A J 42 224 (March) 1940

### COMMENT ON RESULTS OF TREATMENT

A total of 29 patients were given radio-iodine in quantities which might be presumed, a priori, to have a therapeutic effect As might be expected, in the earlier cases the dosage administered was not uniformly effective At the time of starting these experiments there was no accumulated experience as to the possible adverse general effects of the administration of radioactive isotopes of iodine on the internal human economy As our experience became extended, the total activity administered was increased from values in the vicinity of 1 millicurie to a maximum of 28 millicuries in 1 case without the occurrence of even temporary immediate reaction As the series was followed, no clinical evidence has appeared to make us consider that there are any such undesirable effects or dangers in the range of activities used No case of cancer of the thyroid has occurred, it appears unlikely that any such condition will arise from the internal irradiation involved in this form of treatment at the activity levels used

Although the error in the estimation of the actual dosage delivered to the thyroid on the basis of the method of estimation used is necessarily large, it is possible, from the clinical behavior of the latter part of our series, to select the region near 1,000 roentgens (of the 12 hour isotope) as the minimum biologically effective range of dosage In case 2 four separate doses of 1 4, 0 9, 2 4 and 0 8 millicurie were given to a patient with an uniodinized thyroid, with a frank failure of this regimen The total dose in this case was 5 5 millicuries and the thyroid irradiation 500 roentgens (of 12 hour radio-iodine)

### FAILURES

In case 10 (0 7 millicurie), in which operation was performed, the failure of the regimen may be attributed to the use of subminimal doses of radio-iodine In cases 1, 5, 14, 16 and 19 of table 1 operations were performed following the administration of 3 3, 5 7, 15, 10 and 28 millicuries respectively These were the only cases in the series in which operations were performed, and in every 1 of these 5 cases postoperative myxedema or hypometabolism ensued In case 14 the basal metabolic rate was —15 the day before operation, it was essentially normal in the others (on iodides)

The occurrence of postoperative hypometabolism in 100 per cent of patients exhibiting essentially normal basal metabolic rates preoperatively is suggestive of a radiational effect on the thyroid tissue remaining after operation For example, Mrs R, patient 5 who was operated on after receiving 5 7 millicuries (1,000 roentgens) in a planned experiment for another purpose, developed myxedema despite the fact that one of us was present to advise the surgeon to leave 6 to 7 Gm of thyroid (a nonradical subtotal thyroidectomy) in view of the previously demonstrated high radio-iodine uptake by this patient's thyroid It is reasonable to surmise that hypometabolism might not have ensued in such a large percentage of the patients had they not received the radio-iodine prior to operation

An analysis of preoperative basal metabolic rates of the patients operated on indicates that all 5 so treated were adequately controlled on iodides at the time of operation despite the long period of observation of these patients in a nonoperated state

* Case classified as special ophthalmopathic type of hyperthyroidism (Low intake of $I^{130}$)
Eight day isotope figures assume no loss of iodine from thyroid during decay they are therefore excessive They were not measured for cases 13-20

Mrs M B, patient 2, has been taken off iodine in preparation for a 20 millicurie dose of radio-iodine She has remained fairly well, at work, on full iodinization but remains chronically thyrotoxic

Miss R M, patient 3, who had 3 4 millicuries, was subjected to hemithyroidectomy in June 1941 She was in remission off iodides for twelve months but during the past one and one-half years developed a definite recurrence of hyperthyroidism, for the treatment could have been by subtotal thyroidectomy, since the probability of recurrence is distinctly higher following pregnancy in the postoperative follow-up of surgically treated cases

One patient (4, Mrs C S) should, in our opinion, be excluded from the series on the grounds of failure to present a picture of typical toxic diffuse goiter As our experience developed it became evident [6] that patients in the "special ophthalmopathic group" [7] char-

of which she received 20 millicuries of radio-iodine on Jan 9, 1946

In case 10 a temporary control of the disease was achieved, but a true recurrence of the disease following an uneventful pregnancy occurred for which surgical treatment was given at the United States Naval Dependents' Hospital Boston As this patient did not remain "cured" for over a year she is not included in the series of cures In comparing her case with others in which routine surgical treatment was administered, she might be considered as at least having been temporarily benefited to the same extent by radio-iodine as she acteristically had lower thyroid uptakes of radioactive iodine than patients with typical hyperthyroidism Although this patient has done well without operation her improvement cannot be ascribed to the radioactive iodine treatment In our experience this group does well on medical therapy in any event [8] and rather poorly

by rapid cure of the thyrotoxic element by operation It is conceivable, however, that by giving larger dosages of radioactive iodine radiotherapeutic advantage could be obtained even in this class of cases

In summary, therefore, there were 9 cases which comprise this series of "failures"

In 1 case (10), in which there was a recurrence, the dosage of radio-iodine is known to have been probably inadequate (120 roentgens) for biologic effect One, patient 4, is grouped in this list because she was a "special ophthalmopathic" patient, the control of her disease cannot be uniquely attributed to the effect of the radio-iodine

Two patients (3 and 5) had operations as part of planned experiments and gave us the first evidences of possible biologic effect of the radio-iodine which was administered They are, however, included among the failures because of the complicating factor of operation Patient 5 developed myxedema, patient 3 suffered a recurrence after hemithyroidectomy

Five patients (1, 5, 14, 16 19) were operated on who had received dosages of radio-iodine from which one might expect a cure All developed postoperative hypometabolism

Mr P C, patient 19 received divided dosage of 15, 8 and 5 millicuries, the largest total dosage in our

series He developed postoperative hypometabolism after a short period of persistent thyrotoxicosis (basal metabolic rate + 36 to — 18) His basal metabolic rate the day prior to operation was + 13

Finally, patient 2 received a total of 5 5 millicuries of radio-iodine in four divided doses, with a total radiation of 500 roentgens She has not been operated on but exhibits clear evidence of continued thyrotoxicosis which is only moderately well controlled by iodine

SUCCESSES

There were a total of 29 cases in this entire series In 1 case (10) the dosage was subminimal Of the remaining 28 patients who received radio-iodine of therapeutic intensity 5 were subtotally thyroidectomized All 5 developed hypometabolism

In the remaining 23 cases in which radio-iodine of therapeutic intensity was given, no subtotal thyroidectomy was performed In 20 of these patients a recent follow-up indicates that they are no longer thyrotoxic The remaining 3 cases (2, 3 and 4, already discussed) cannot be considered as successes

The thyroid gland in all but 3 of these patients became normal in size (impalpable) In the 3 patients in whom the thyroid is still palpable, despite general metabolic and clinical cure (off iodine), there were decided reductions in the size of the goiters They have firm to hard glands which suggest the presence of chronic thyroiditis or fibrosis These patients had the largest pretreatment goiters One of them (12) states that his collar size has now returned to the same as he had worn prior to the onset of hyperthyroidism He had had a large goiter (three times normal size) prior to treatment

In addition to the 20 cures in which operation was not performed, there is pathologic evidence for cure in 1 case (16) in which operation was performed A 28 Gm thyroid was removed, it showed histologic "involution," and myxedema subsequently developed

There were no mortalities in the series either as a result of thyrotoxicosis or due to operation in the 5 cases The incidence of myxedema and hypometabolism has been mentioned

No undesirable complications such as tetany or loss of phonation occurred No tracheal or laryngeal irritations occurred No undesirable radiation effects were observed No anemia ensued in any patient in the series

Although 5 of the 20 patients not operated on developed basal metabolic levels of — 15 to — 20, no one suffered the development of permanent myxedema at the dosage level employed in this series

CONCLUSIONS

From these data it is clear that we are now in a fair position to set down a minimum dosage and a preliminary estimation of the therapeutically effective dosage range in typical cases of hyperthyroidism This range is from 5 millicuries to 25 millicuries (as a single dose), with the choice of the dose largely a function of the clinical estimation of the size of the goiter of the patient being treated

The calculated dosages administered in those cases (500 to 2,500 roentgens) (± 50 per cent) in which treatment was successful are in satisfactory agreement with the x-ray dosages which have been successfully used (1 000 to 1,200 roentgens) The apparently greater efficacy of the radio-iodine treatment as compared with orthodox x-ray treatment may perhaps be attributed to the fact that x-ray dosages are sometimes limited by the appearance of undesirable skin reactions and the intraglandular irradiation within the thyroid cells may conceivably offer certain advantages over external irradiation On the basis of our experience to date, the following are considered to be important clinical considerations in patients who are to be chosen to undergo treatment by radioactive iodine

1 No previous iodine therapy, or if previously treated, iodine treatment to be stopped for at least one month to allow maximum uptake of the radioactive iodine dose

2 Availability for close follow-up

3 Administration of routine iodinization, starting one to three days after the administration of radio-iodine as soon as the uptake is known to be adequate

4 Unwisdom of treating patients having large goiters with secondary involutional changes at this time by this means, as surgery might be needed by them on a purely mechanical basis, even though detoxification by radioactive iodine could be accomplished Early diagnosis and early treatment of cases would then appear to offer major advantages in this as in many other forms of treatment.

The treatment of the special cases in the ophthalmopathic group of hyperthyroidism appears to offer special problems, as do cases of large, involutional goiters However, typical cases of hyperthyroidism respond to this form of treatment in such a manner as to make it possible to venture the prediction that this therapeutic program may in time replace the surgical approach currently in vogue

Radioactive iodine is produced in enormous quantities in nuclear chain-reacting piles When radio-iodine from such sources is made readily available to the medical

profession, this form of treatment may well prove itself not only highly effective, safe and noninjurious but also cheap and of least inconvenience to the patient who may receive it while continuing at his normal pursuits After a short period of hospitalization for the usual preliminary clinical studies and the administration of radio-iodine, the patient may be fully iodinized and released, to be followed as an ambulatory case

SUMMARY

On the basis of a series of animal and clinical experiments using radioactive isotopes of iodine as a tracer in the study of thyroid physiology and iodine metabolism the treatment of 29 cases of hyperthyroidism with internal irradiation by radioactive iodine was instituted By careful excretion studies, external counter measurements over the thyroid gland and by planned operations in 2 cases, data were obtained which allow us to construct a formula for a procedure in treatment

The addition of ordinary iodine therapy after the administration of radio-iodine offers many advantages in the clinical care of these patients and in the economy and safety of the procedure

By an analysis, over a long period, of both the failures and successes in this series of 29 cases, it is shown that radioactive iodine when given in the dosage range of 5 to 25 millicuries to uniodinized patients with hyperthyroidism possessing goiters of 60 to 75 Gm is highly effective as a cure of the disease in about 80 per cent of cases When appreciable activity has been administered and subtotal thyroidectomy is resorted to, myxedema or hypometabolism may be expected to develop in a large fraction of the cases (100 per cent in 5 cases in this series)

## THE TREATMENT OF HYPERTHYROIDISM WITH RADIOACTIVE IODINE

EARLE M CHAPMAN M D
and
ROBLEY D EVANS Ph D
Cambridge Mass

Roentgen treatment has been used for hyperthyroidism for many years In 1923 Means and Holmes [1] pointed out that in this form of treatment about one third of the patients are cured, another third improved and another third not affected Since 1923 ordinary iodine by mouth has been used as a preoperative method of quieting the hyperactive thyroid in preparation for surgery *Under iodine alone occasionally the* patient and the doctor have been agreeably surprised to find that the symptoms and signs of hyperthyroidism disappeared, and a permanent remission apparently was effected That x-ray treatment and iodine treatment sometimes cure hyperthyroidism led to the hope that some day a more effective, nonsurgical agent would be found Then the MacKenzies [2] and Astwood [3] discovered that several chemical compounds inhibit the function of the thyroid in hyperthyroidism as well as under other circumstances Several of these agents have been investigated, and until now thiouracil has been found to be most useful in the treatment of thyrotoxicosis

Induced radioactivity was discovered in 1934, and that same year Fermi and his co-workers [4] in Italy prepared radioactive isotopes of iodine Because the thyroid absorbs iodine selectively, it seemed likely that beta rays from iodine rendered radioactive would have a greater radiation effect than that derived from roentgen rays delivered through the skin and overlying tissues

The use of radioactive iodine in the study of thyroid physiology was soon undertaken and reported first in 1938 by *Hertz, Roberts and Evans* [5] *Subsequently* these and other investigators used various isotopes of radioactive iodine as tracers for the study of thyroid function [6] and it was found that in untreated hyperthyroidism the thyroid may take up as much as 80 per cent of a small dose (less than 2 mg ) of iodide within a few hours after oral administration [7] This established the basis for therapeutic trials of radioactive iodine, and in 1942 Hertz and Roberts [8] published a preliminary report of the treatment in this manner of 10 patients In this series the procedure was to give the radioactive iodine and follow this with ordinary iodine by mouth for a period of several months However, our review in the clinic of these 10 cases of Hertz and Roberts, and an additional 18 so treated under the direction of Hertz, has led to the conclusion that it is difficult to decide whether those patients who improved were responding to the ordinary iodine, to the radioactive iodine or to their combination The dosage of radioactive iodine given to these 28 patients averaged 5 millicuries in 1941, 10 millicuries in 1942 and 14 5 millicuries in 1943, the largest single dose being 21 millicuries In April 1943 Dr Hertz went on active duty in the Navy and asked us to continue with this study The present report is on a series of 22 patients with hyperthyroidism *treated only with radioactive iodine and with considerably* higher doses Although both Hertz and Roberts [8] and Hamilton and Lawrence [9] were encouraged by their therapeutic trials, the details of their findings have not yet been published

### METHODS AND DOSAGE

#### *Selection and Care of Patients*

The patients selected in the Thyroid Clinic of the Massachusetts General Hospital for radioactive iodine therapy were judged by several physicians to be thyrotoxic on the basis of classic disease pattern accompanied with constantly elevated basal metabolic rates All patients had thyroids estimated to be at least two to three times normal in size All but 3 were kept free from all forms of treatment, especially iodine, for at least four weeks prior to giving radioactive iodine For the administration of the drug they were usually hospitalized for a time adequate to obtain levels of their basal metabolic rate, then given radioactive iodine by mouth—simply a drink of what tastes like rather stale water

Aided in part by a grant from the John and Mary R. Markle Foundation

From the Thyroid Clinic of the Massachusetts General Hospital (Dr Chapman) and the Radioactivity Center of the Department of Physics of the Massachusetts Institute of Technology (Dr Evans)

The urine was then collected for a period of three days to measure the urinary excretion of radioactive iodine

*Preparation of Radioactive Iodine*

The radioactive iodine is prepared by the nuclear bombardment of metallic tellurium, in the Massachusetts Institute of Technology cyclotron, using 14 MEV (million electron volts) deuterons This bombardment transmutes tellurium into iodine The principal isotopes produced in this way are $I^{130}$ (half period 12 6 hours) and $I^{131}$ (half period 8 0 days) Immediately after a short bombardment the 12-hour iodine has about ten times the radioactivity of the 8-day iodine isotope which is produced simultaneously The ratio of 12-hour to 8-day iodine decreases with increasingly long bombardments For the preparation of therapeutic radioactive sources the bombardments were usually about three to ten hours in duration

Following the bombardment, the radioactive iodine is separated[10] from the target To the metallic tellurium is added 0 5 mg of iodine as potassium iodide and 25 cc of 3 molar sulfuric acid Then concentrated nitric acid is added dropwise while the solution is heated This dissolves the target and causes the iodine to distil over as elementary iodine, which is collected in carbon tetrachloride The carbon tetrachloride solution is washed once with water in a separatory funnel and then the iodine is reduced with sodium bisulfite and is extracted in an aqueous layer as sodium iodide This aqueous solution is filtered to remove any residual droplets of carbon tetrachloride

The final solution presented to the patient is distilled water containing 14 to 79 millicuries[11] of 12-hour iodine and about one-tenth that amount of 8-day iodine in 0 5 mg of iodine as sodium iodide Because of the rapid decay of the 12-hour isotope, which is the more important radiation source, all preparations were administered to the patients within one to four hours after the conclusion of the bombardment The doses in table 2 are in terms of the radioactivity of the 12-hour isotope at the time of administration

*Tissue Radiation Doses*

In the therapeutic use of x-rays, the radiation doses are commonly reported in roentgens The x-rays produce high-speed secondary electrons in the tissue, and the therapeutic effect of x-rays is actually due to the interaction of these secondary electrons with the tissues The beta rays from a radioactive isotope are also high-speed electrons These beta rays can therefore be expected to produce tissue effects similar to those produced by x-rays, and the radiation dosages can also be expressed in roentgen units The beta rays have a maximum range of only a few millimeters of tissue Therefore the radiation doses are confined almost exclusively to the tissue actually containing the radioactive isotope and are proportional to the concentration of the isotope in the tissue

The tissue radiation dose may be predicted quantitatively for an average patient in terms of the number of millicuries of 12-hour iodine administered per estimated gram of thyroid tissue Patients may show wide variations from this estimated average tissue radiation dose, especially because of individual variations in the retention of radioactive iodine It is assumed that substantially all the administered iodine is either taken up by the thyroid gland or excreted in the urine A high urinary excretion of radioactive iodine indicates a correspondingly low retention of iodine by the thyroid, with a consequent reduction in the radiation dose available to the gland

The tissue radiation dose delivered to the thyroid gland can be estimated from the shape of the iodine retention curve,[7] the measured fractional urinary excretion of radioactive iodine, the radioactive decay curve of the two isotopes involved and the roentgen equivalent[12] of the energy of the radiation from the two isotopes

A concentration of 1 mc ($3 7 \times 10^7$ disintegrations per second) of 12-hour iodine per gram of thyroid tissue delivers 12 3 roentgens per minute If 0 1 mc of 8-day iodine is also present per gram of tissue this will add 0 85 roentgen per minute

As an illustration, we shall estimate the radiation delivered to the thyroid by the 14 millicurie dose given to patient 1 Urinary excretion measurements showed that this patient excreted about 25 per cent of the dose in three days This patient received 14 mc of 12-hour iodine and about one tenth as much 8-day iodine The thyroid was estimated to weigh 40 Gm If all the

administered iodine should be concentrated in the thyroid ($R = 1 00$) the initial dosage rate $A_o$ would be 12 3 (14/40) = 4 30 roentgens per minute from the 12-hour iodine plus 0 85 (14/40) = 0 30 roentgen per minute from the associated 8-day isotope

The constant coefficient of the equation[13] for determining the total roentgen ray dosage due to the 12-hour isotope is $1 44\ TA_o = 1 44 \times 12 6 \times 60 \times 4 30 = 4,680$ roentgens The dosages delivered in each 12-hour interval are given in the last column of table 1 It will be noted that 50 per cent of the total radiation dose from the 12-hour isotope is delivered in the first twelve hours, and 90 per cent is delivered within the first thirty-six hours after administration The tissue dose per hour is mainly due to the 12-hour isotope for the first 2 5 days Thereafter the 8-day isotope adds approximately 2 per cent each day to the total radiation previously delivered by the 12-hour isotope

In the previously treated patients[8] the use of low doses, below 10 mc, was thought by us to explain the lack of improvement in several patients, so it was decided to increase greatly the dose and if possible to

* Percentage in two days
† Dr Wendell C Peacock made these determinations

discover the amount needed to produce total thyroid inactivity (myxedema) With this in mind the first doses were usually less than 0 5 mc per estimated gram of thyroid tissue Later these were increased to between 0 5 and 1 0 mc of 12-hour iodine per estimated gram of thyroid tissue The average total dose per patient became 40 to 50 mc and the largest single dose given has been 79 mc , which was about 0 8 mc per estimated gram of thyroid tissue

REPORT OF CASES [14]

CASE 1—E W , a man aged 49, a railroad agent who had been thyrotoxic since 1928, had 120 Gm of thyroid removed in the Massachusetts General Hospital in 1930 after an iodine preparation, the postoperative course was stormy because of pulmonary collapse and edema Through 1931, 1932 and 1933 he was moderately toxic despite taking iodine as Lugol s solution, at least 10 drops daily In June and August 1933 he was given roentgen therapy with a daily dose of 200 roentgens measured in air over a 10 cm square field to alternating sides of the neck A total of 800 roentgens was given to each side of the neck in eleven days The voltage used was 200 kilovolts and the filter used was 0 5 mm of copper and 4 0 mm of aluminum On three subsequent days he received another 800 roentgens to the posterior part of the neck The target skin distance was 50 cm Although the mass of tissue decreased in size, there was little decrease in his hyperthyroidism He was not seen again in our clinic for ten years, and then in the spring of 1943 he returned, obviously toxic He said that in 1941 he had been in a veterans' hospital but refused operation On May 11 1943 the basal metabolic rate was plus 36 and it was estimated that he had 40 Gm of recurrent thyroid tissue The eye signs were moderate On May 18 he took 14 mc. of radioactive iodine and excreted in successive twenty-four hour intervals 14 8 2 and 1 per cent for a total of 25 per cent in four days After an initial rise to plus 50 on June 1, the basal metabolic rate declined steadily to minus 12 by July 17 On August 21 the basal metabolic rate was plus 7 and the patient was delighted with the results of treatment He had gained weight the pulse was slower, the diarrhea had stopped, the eyes were almost normal in appearance and the thyroid was definitely smaller in fact, it was difficult to feel any tissue On September 24 a second dose of 20 mc was given This time at least 95 per cent of the dose was excreted in the urine in the three day period suggesting that his thyroid handled iodine like a normal gland [5] Owing to the small retention of radioactive iodine by the gland this second radiation dose was unimportant Throughout the remainder of 1943 he considered himself well and had normal basal metabolic rates In 1944 he was so well that he came to the clinic only twice for tests On Feb 5 1946 he was working regularly as a freight agent and had a basal metabolic rate of plus 8 after driving in 18 miles for the test There were no signs of toxicity and no thyroid tissue was felt

CASE 2—M M a Negro woman aged 38 had a huge symmetrical goiter with a bruit, definite exophthalmos and other signs of severe toxicity In 1934 she had been operated on at the Peter Bent Brigham Hospital for multiple nontoxic adenomas of the thyroid Thereafter she was well until 1939 From then through 1942 the signs of toxicity gradually developed, but no goiter was noticed by her By February 1943 eye signs were first noted by the patient and her doctor In March she was given six diathermy treatments to her neck and immediately after this her neck swelled until a large goiter could be recognized at a distance When first seen by us it was estimated to weigh 120 Gm She had a basal metabolic level of plus 50 and on June 2, 1943 she received the first dose of 15 mc After an increase in the basal metabolic rate to plus 65 the rate fell to plus 20 by June 28 By August 15 the metabolic rate was still elevated and she had shown little response, so she was given a second dose of 53 mc on August 17 Thereafter she was nauseated for twenty-four hours She excreted in successive twenty-four hour intervals 13, 14 and 8 per cent, or a total of 35 per cent. The basal metabolic rate dropped to minus 14 by August 31 She seemed better, and the gland decreased in size However, in the month of September the metabolic rate went up and she was obviously toxic. A third dose of 79 mc was given on September 29 Nausea and also fever upset the patient, but she recovered in three days and began to improve In successive twenty-four hour intervals she excreted 27, 18 and 4 per cent for a total of 49 per cent in three days By November the basal metabolic rate had dropped to minus 13 and she showed clinical evidence of the improvement by a gain in strength and weight and a decrease in the size of the goiter, which had become much firmer—almost hard—and estimated to weigh 45 Gm

Throughout 1944 (chart 1) the patient continued to have normal or low metabolic rates, but the goiter persisted as a hard mass two to three times normal size and definite eye signs persisted Despite the low basal metabolic rates she was judged to be in active disease She was alternating at a job with her goiterous sister when seen on Jan 9 1945 The goiter was just visible, and a 2 cm nodule had developed in the upper right lobe She was then judged to be nontoxic,

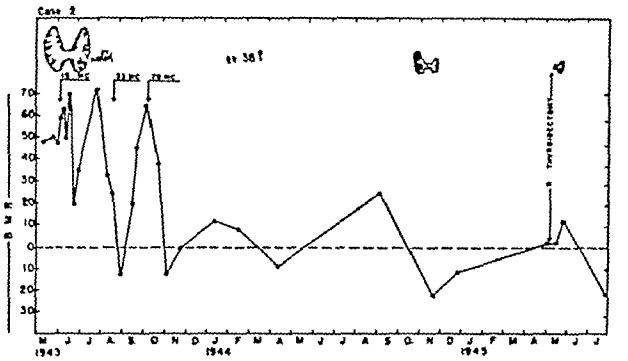

Chart 1 —Course of patient 2 who received three doses of radioactive iodine

with pulse rate 60 and weight 53 9 Kg , a total gain of 6 9 Kg Removal of the right lobe with the nodule was advised and on May 17 she entered the metabolic study wards and first had a tracer dose of 8-day ($I^{131}$) iodine and excreted 37 per cent and 4 per cent in two successive twenty-four hour intervals

On May 19, without specific antithyroid medication Dr Robert Linton removed the right lobe The operation was difficult because of fibrous adhesions and scar tissue Histologic section of this tissue showed a background of dense fibrosis with islands of small follicles lined with cells of increased height and containing little colloid Giant nuclei were present The patient made a rapid recovery and left the hospital on the fifth day after operation On subsequent visits to the clinic she has considered herself well The basal metabolic rate on Feb 21 1946 was plus 12 and she seemed normal

CASE 8—L S a man aged 42 a taxi driver entered the hospital Jan 5 1944 with classic symptoms and signs of moderately severe hyperthyroidism of six months duration. The thyroid was symmetrically enlarged to three times normal, and there was a large bruit The eye signs were minimal The basal metabolic rates were plus 44 to 52 On January 19 he drank 48 cc. of a solution containing 43 mc and that evening experienced nausea and the following day fever to 102 F (oral) With this upset he said that the thyroid increased in size. By January 21 he was much better and the temperature returned to normal Excretion of radioactivity in the first day was 6 per cent second day 7 per cent, third day 3 per cent and fourth day 2 per cent a total of 18 per cent.

14 A summary of the 22 cases is given in table 2 Space does not permit the inclusion of histories of all 22 cases in THE JOURNAL Histories of all cases however will appear in the reprints The following 5 cases have been selected as illustrating significant points in the treatment of hyperthyroidism with high dosage of radioactive iodine Case 1 The first case treated in this series Case 2 A huge goiter that required three doses of radioactive iodine A hard nodule developed that was removed and proved to show fibrosis Case 8 Response to a single dose of radioactive iodine followed by a return to a euthyoid state, Case 12, in which clinical myxedema developed and persisted for over a year Case 16 in which sensitiveness to both thiouracil and iodine was shown with good response later to radioactive iodine

The response of this patient (chart 2) has been very good and at the visit on Nov 11, 1945 his basal metabolic rate was plus 1

CASE 12.—H R, a woman aged 37, a housewife, was admitted to the wards on July 21, 1944 with moderate hyperthyroidism, moderate eye signs and a thyroid that was symmetrically enlarged to two and one-half times normal A bruit was present The basal metabolic rate ranged from plus 30 to 40 Fortu

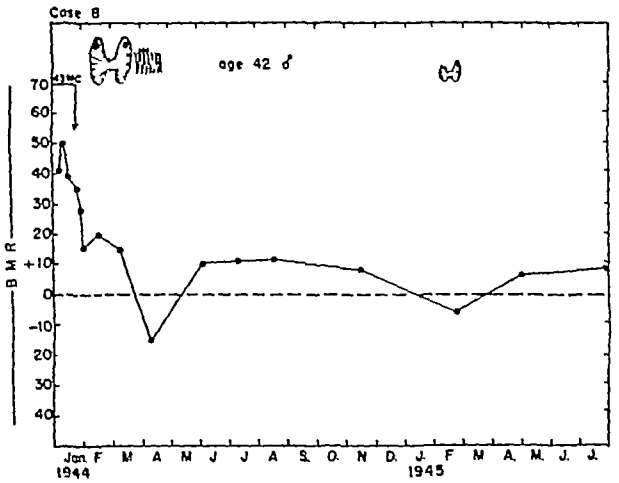

Chart 2.—Response to single dose of radioactive iodine in case 8

nately only one dose of 5 drops of saturated solution of potassium iodide was given on July 28, so on the 4th of August 27 mc of radioactive iodine was given by mouth The patient improved rapidly and by September 5 the thyroid seemed normal the eyes were normal and the metabolic rates were normal Through the autumn she gradually felt cold and sluggish and by November 28 the basal metabolic rate was minus 20 and she was in a state of moderate myxedema No treatment for this was given, but continued observations confirmed this opinion. By Feb 6, 1945 she had gained 8.6 Kg and suffered from the cold Through 1945 she continued to feel sluggish and tired easily, and the basal metabolic rate continued low and the thyroid was not palpable Chart 3 depicts her course She has not taken thyroid

CASE 16.—M R, a woman aged 37, a housewife, was referred to us by Dr R. H Williams of the Boston City Hospital Her favorable response to thiouracil had previously been reported (Williams and Bissell,[15] case 5) but in July and again in November 1944 she developed acute febrile, toxic reactions to thiouracil and thiourea, so another form of treatment became necessary Five drops of saturated solution of potassium iodide twice daily was tried, but this caused an extensive dermatitis with fever, a reaction that lasted about a week

When first seen by us on Dec 5, 1944 she was in active thyrotoxicosis with the basal metabolic rate plus 36 and a diffusely enlarged thyroid without a bruit The eyes showed lid edema slight exophthalmos and lid lag The gland was estimated to be three times normal size (45-60 Gm.) December 8 she swallowed 52 mc of radioactive iodine That night she vomited and noted pressure in the neck Excretion for zero to twenty-four hours was 28 per cent and from twenty-four to forty-eight hours 6 per cent, totaling 34 per cent. On December 19 the basal metabolic rate was minus 2 and she felt much better Subsequently she showed a weight gain and a decline into a myxedematous state, but without medication she returned to low normal basal metabolic rates The thyroid was not palpable Chart 4 best depicts her course.

## COMMENT

These 22 cases represent our three years' experience in treating hyperthyroidism only with large doses of radioactive iodine If we try to summarize the results we can say that as with other methods of treatment, there are good results, surprising effects and some poor results and disappointments Obviously such a small group does not lend itself to statistical analysis Of the 22 patients who originally had goiters at least two to three times the size of a normal thyroid, 21 (all except patient 2) now have no goiter, or a thyroid that is just palpable We can point out that, of 12 patients treated before Aug 15, 1944, 11 are well and show no signs of toxic goiter, the 12th, patient 9, continues mildly thyrotoxic Patient 2 originally had a huge goiter and developed a hard, nodular right lobe that was removed by hemithyroidectomy The histologic appearance of this gland was of fibrosis engulfing scattered acini with high columnar cells No evidence of malignant disease was seen The reduction in the amount of hyperplastic tissue seems to explain the response to treatment However, the remaining thyroid follicles appear to be hyperplastic, so that it seems reasonable to conclude that radioactive iodine does not affect the original stimulus causing hyperthyroidism but acts only to destroy the overfunctioning parenchyma

The basal metabolic curves of 14 patients who received a single dose of radioactive iodine are recorded graphically in chart 5 The rate of response is in reasonable relation to the probable loss of previously formed thyroxin Our composite curves may be compared to the iodine-response curve [16] and the thiouracil-response curve [17] both of which have been interpreted as thyroxin-decay curves The average length of time for the complete response to the radioactive iodine treatment was about seven to eight weeks, which is longer than the time required for the response to iodine or thiouracil

Of the 10 patients treated since Aug 15, 1944,[18] all have made a good response to treatment, although the basal metabolic rate of patient 13 has continued above normal, but the patient has no goiter and insists that she is well By a response to treatment we mean that the patients have felt better, gained weight and had an

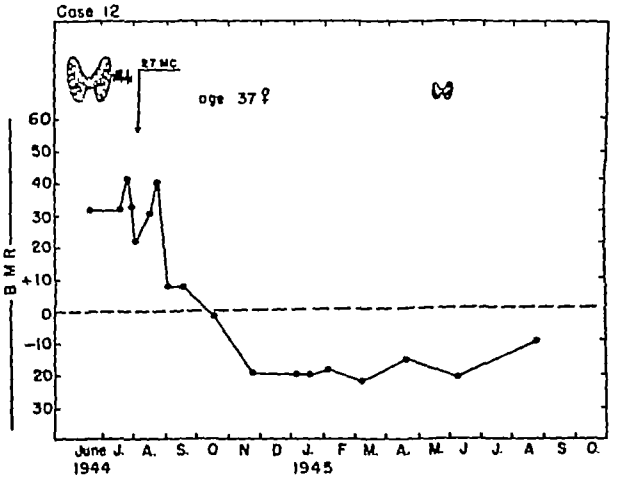

Chart 3.—Course of patient 12 who swallowed a single dose of radioactive iodine and has subsequently continued in myxedema

appreciable decrease in the size of the goiter, a persistent fall in their basal metabolic rate and a diminution in their eye signs Improvement of the eyes has been

18 Twenty five additional cases in which there has been response to treatment since March 1945 are not included in this report as the follow up period has been too short

least of all these responses Of the 22 patients treated there was only 1 who had severe ophthalmopathy, and we believe that this decreased after the treatment with radioactive iodine Another index of a favorable response has been the observations on the blood lipid fractions before and after treatment Dr F F Foldes [19] made these determinations in 3 cases, in all of which the plasma lipid values increased after treatment, parallel with the clinical improvement

It is of note that 7 of our 22 patients (1, 2, 5, 10, 14, 15 and 17) had been previously operated on for

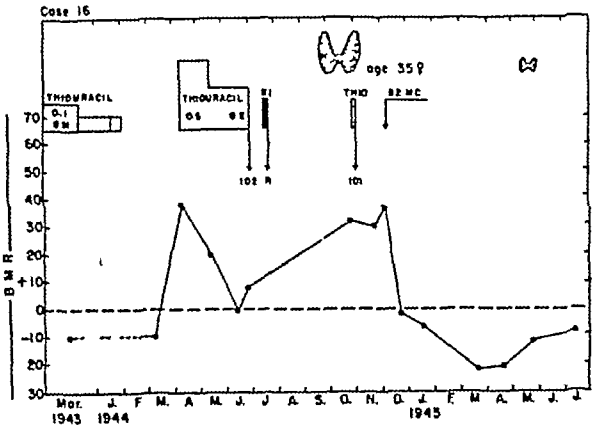

Chart 4—Response of patient 16, a woman who became sensitive to thiouracil and iodine and has responded to a single dose of radioactive iodine

hyperthyroidism and these 7 have responded very well to radioactive iodine treatment Three (1, 3 and 17) of the 22 had received previous roentgen treatment by the usual external application without halting the disorder and yet in each a good result has been obtained with radioactive iodine. One patient, sensitive to both thiouracil and iodine, has had a good response and developed mild myxedema Eight (2, 4, 5, 6, 7, 9, 11 and 13) of the 22 patients had not previously taken iodine, of these 8 patients 3 (2, 11 and 13) had the largest goiters in the entire group and required three doses at intervals of several months to control their thyrotoxicosis The response to this form of radiation seems roughly in inverse proportion to the amount of tissue causing thyrotoxicosis The larger goiters did not respond as quickly as the smaller

The absence of ordinary iodine and yet the adequate response to radioactive iodine support our belief that ordinary iodine by mouth is not needed in conjunction with radioactive iodine therapy However, it seems advisable to withhold ordinary iodine for several weeks before administering radioactive iodine in order to assure maximum uptake by the thyroid of the radioactive iodine The lack of iodine in the gland may be a condition that favors a better response to radiation, possibly this links with the good effects seen from external roentgen treatment in the period before 1924, when iodine treatment became popular We have as yet no comparative experiments demonstrating whether or not ordinary iodine started a few days after the radioactive iodine will hasten the response Such a series is now under observation

In 4 instances (cases 3, 12, 15 and 16) hypothyroidism, or evident myxedema, was produced Although none of these 4 were treated with thyroid, 2 gradually returned to low normal basal metabolic rates The approximate dosage of 1 millicurie per estimated gram of tissue in these 4 cases seems to be high, and yet we have tried this dosage in others without producing myxedema The individual variation in absorption and excretion makes the matter of dosage selection uncertain

Toxic reactions to large doses of radioactive iodine are very much like acute roentgen ray sickness Nausea, vomiting, malaise and even slight increase in gland size and fever occurred and lasted two days at the most, the doses were 48 mc or more in 4 of the 6 patients having radiation sickness No subsequent ill effects or leukopenia have been observed Malignant changes were not observed in the tissue removed in 2 cases, 1 as long as two years after this form of radiation

## SUMMARY AND CONCLUSION

1 In hyperthyroidism orally administered doses of radioactive iodine, carried in about 1 mg or less of ordinary iodine, are concentrated largely in the thyroid gland The beta rays from the radioactive iodine deliver within the thyroid an internal radiation which is physically similar to roentgen radiation The radiation dose in a patient who swallowed 14 millicuries has been calculated as equivalent to approximately 3,490 roentgens, due to the 12-hour isotope

2 Between May 1943 and March 1945, 22 patients having hyperthyroidism were treated with large doses of radioactive iodine No other form of therapy was given

3 Fourteen patients responded well to a single dose of radioactive iodine, 3 were given two doses and 5 were given three doses Myxedema has followed this treatment in 4 patients Two patients after treatment with this agent, though improved, still have mild hyperthyroidism

4 Reactions which resembled roentgen ray sickness were observed in 6 patients following large doses of radioactive iodine Fibrosis of the thyroid has been observed in biopsy of 2 patients after treatment

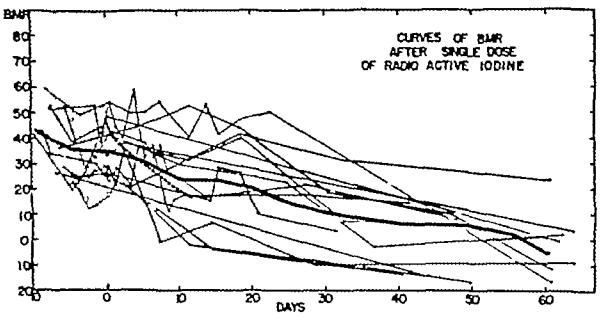

Chart 5—Curves of basal metabolic rate after a single dose of radioactive iodine. The shaded area is before the treatment. The heavy black line is the average of fourteen curves The dotted line is the ordinary iodine response curve of Means

5 Patients who have not responded to other forms of treatment or have been sensitive to iodine or thiouracil have responded well to radioactive iodine Ordinary iodine is not necessary with radioactive iodine treatment

6 We believe that therapy with radioactive iodine can be added to the growing list of medical methods for the control of thyrotoxicosis

# SURGICAL ASPECTS OF AMEBIC DYSENTERY

LIEUTENANT COMMANDER GUSTAF E. LINDSKOG
and
CAPTAIN WALTMAN WALTERS
Medical Corps, U. S. Naval Reserve

We are reporting 3 cases of amebic hepatic abscess and 1 case of obstructing amebic granuloma of the ileocecal region. These cases were complicated in many respects. Perforation of the abscess to the diaphragmatic region was the first evidence of amebic hepatic disease in 1 of the cases, which was similar to 2 other cases reported by Walters, Watkins, Butt and Marshall.[1] Administration of amebacides, aspiration of the abscess and right hemicolectomy were the successful methods of treatment in the respective cases.

The opinion is still held rather generally, although erroneously, that amebic dysentery is a tropical disease with only sporadic and more or less accidental appearances in the temperate zone. More correctly, it is an endemic disease of all climates and of worldwide distribution. Faust[2] stated that "Endameba histolytica has been found wherever careful coprological surveys have been made on the human population from Saskatchewan, Canada (52° 30′ N.) to the Strait of Magellan (52° S.)." The existence of asymptomatic or convalescent carriers (cyst passers) assures the propagation of the disease by the well known routes of contamination of food and water in which poor hygiene, house flies and cockroaches play a role. The return to the United States of several million overseas veterans from heavily infested regions makes it certain that amebiasis will have an increased incidence in this country in the near future.

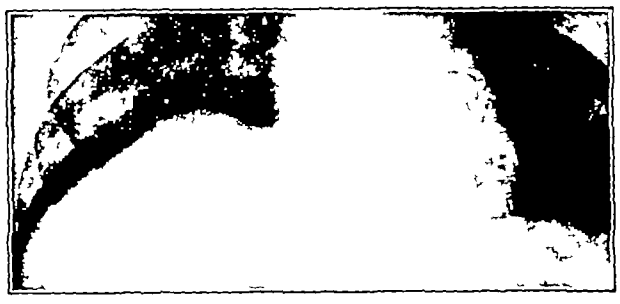

Fig. 1.—Elevation and irregularity of right hemidiaphragm.

Although several surveys of sample populations, by the methods of stool examinations, indicate that from 5 to 10 per cent of our people have Endameba histolytica at some time in their intestines, Faust[2] expressed the belief that "in the population of the United States an average amebiasis incidence as high as 20 per cent may be reached, rather than the accepted figure of 5 to 10 per cent." Craig[3] has estimated that between 6,000,000 and 12,000,000 people in the United States are infected, but Ochsner and DeBakey[4] expressed the belief that a figure of 20,000,000 to 25,000,000 would be more accurate. And, to quote from the latter authors, "the potential number of hepatic complications is approximately one million."

Amebic dysentery is of surgical interest in two ways. First, it simulates more familiar clinical syndromes such as appendicitis, cholecystitis, pancreatitis, perforated peptic ulcer and carcinoma of the colon. Ill advised surgical treatment in the misdiagnosed amebic case, unprepared by specific antiamebic therapy, has been a serious cause of poor results and a high mortality rate, as witness the aftermath of the Chicago epidemic.

Second, the complications of this disease in its original site, the colon (namely, acute perforation with peritonitis, chronic perforation with pericolic abscess, and granuloma) and in its chief metastatic sites (abscess of the liver, lungs and brain) may call for a direct surgical approach in cases in which there is insufficient response to emetine and other amebacides.

Both of these aspects are well illustrated by a report of 4 cases which were observed within a short period at a naval hospital.

## REPORT OF CASES

CASE 1.—*Amebic hepatic abscess treated with emetine, other amebacides and closed aspiration.* A marine corporal aged 25 was admitted with a tentative diagnosis of gastroenteritis on Dec. 11, 1944. Five days before admission he had begun to have nausea and vomiting, followed by flatulence and crampy pain in the epigastrium. Following the onset, his stools became liquid and numbered three to four daily.

The patient had had several episodes of dysentery while on active duty in the South Pacific a year previously but with no specific diagnosis or treatment. He had been under atabrine antimalarial suppressive treatment for the past two and a half years, without previous toxic symptoms.

The temperature on admission was 103 F., the pulse rate 120. The patient appeared acutely ill and undernourished. There was an intense yellow pigmentation, which did not involve the scleras. There was enlargement of the liver with epigastric tenderness. A roentgenogram of the thorax, taken on admission, was reported negative.

The concentration of hemoglobin was 10.0 Gm. per hundred cubic centimeters of blood. Erythrocytes numbered 3,340,000 and leukocytes 16,400 in each cubic millimeter of blood. The percentages of the various types of leukocytes were as follows: neutrophils 80, eosinophils 0. The icterus index was 5.6. The concentration of bilirubin was 0.5 mg. in 100 cc. of serum. A blood smear did not show malarial parasites. Stools were constantly negative for amebas.

On December 15 suppression of the breath sounds and relative dulness were noted at the base of the right lung. The patient was transferred to the surgical wards with a tentative diagnosis of subhepatic abscess.

In view of the history of dysentery, acute fever, chills and enlarged, tender liver, a diagnosis of amebic hepatitis and abscess was made.

Sigmoidoscopy revealed two or three small rectal ulcerations, discrete and punched out, with a surrounding zone of congestion. Administration of 0.06 Gm. of emetine daily was begun December 18. The temperature was normal in four days, and administration of emetine was discontinued in nine days.

Because of a persistent tender mass in the epigastrium, on December 28 a small incision was made in the subxiphoid

region while the patient was under local anesthesia, 700 cc of buff colored pus was removed by needle aspiration from a mass in the anterior border of the liver On Jan 4, 1945 an additional 50 cc was evacuated Sluggishly motile trophozoites were found on smear On January 3 a second sigmoidoscopy gave negative results Administration of carbarsone was begun

Convalescence was smooth and rapid until January 9, when a temperature of 102 F developed with malaise. The following day the patient had a chill, with a temperature of 104 6 F A malarial smear was positive for Plasmodium vivax The patient was given 5 grams (0 3 Gm) of quinine three times a day for three days, and suppressive treatment by administration of atabrine 0 1 Gm. three times a day was resumed The temperature remained normal during the rest of the period of hospitalization The liver was no longer palpably enlarged or tender

A second ten day course of carbarsone was given beginning January 17, and a seven day course, beginning February 26

On March 27 the concentration of hemoglobin was 13 0 Gm per hundred cubic centimeters of blood Erythrocytes numbered 4 500,000 and leukocytes 10,800 in each cubic millimeter of blood

The patient was given a convalescent leave and returned to duty April 11, 1945 He has since had one recurrence of malaria but no further intestinal symptoms

Case 1 illustrates a number of important points Amebic abscess of the liver may occur many months or many years after the initial colonic infection In about 50 per cent of cases one is not so fortunate as to have a clearcut history of antecedent diarrhea or dysentery and acute colonic symptoms are not usually present[4]

As in this, in about 60 per cent of cases of abscess the stools are negative for amebas on repeated study by the technic of saline catharsis and warm stage examination

While the leukocyte count is typically elevated to 15,000 or 30,000 in each cubic millimeter of blood, it may be normal in cases of chronic abscess with a well developed wall reaction

Emetine and the adjunct drugs may not be curative when amebic hepatitis has progressed to gross abscess formation Yet the effect of the amebacide should be assayed with patience unless rupture seems imminent, such treatment reduces the mortality rate of subsequent surgical treatment from 60 to about 3 per cent and may render any surgical procedure unnecessary

Aspiration of the abscess with a trocar or needle is preferred to external drainage, as simpler and safer, unless (1) the abscess has ruptured intraperitoneally, (2) it is located in the left lobe (about 15 per cent of cases), (3) it is otherwise inaccessible or (4) it has been demonstrated to be contaminated by pyogenic organisms Under such circumstances external drainage may be preferable

The patient may be a simultaneous victim of more than one protozoan parasite, as demonstrated by the concomitant malaria in this case

CASE 2—*(1) Amebic hepatic abscess with diaphragmatic perforation and involvement of respiratory tract (2) evidences of emetine toxemia* A white man aged 35 a warrant officer began to have diarrhea in March 1945, the day after he arrived in the United States after eighteen months' shore duty in Brazil He had three to six loose yellow stools with blood-flecked mucoid particles daily He had lost about 30 pounds (13 6 Kg) during the course of his illness and had noted some postprandial distress and anorexia

On admission May 3 1945, his temperature was 99 8 F, pulse rate 120 and respiratory rate 24 There was slight epigastric tenderness There was mild secondary anemia leukocytes numbered 9,250 in each cubic millimeter of blood Stools were repeatedly negative for ova and parasites The results of roentgenographic examination after a barium enema were reported normal, and sigmoidoscopy showed slight injection of the mucosa but no ulceration A roentgenogram of the thorax on May 9 (fig 1) showed a slight irregular elevation of the medial right hemidiaphragm On May 15 the patient had sudden pain in the right lower portion of the thorax, dyspnea, cyanosis and tachycardia Another roentgenogram showed an elevated right hemidiaphragm and a region of pneumonitis at the right base A diagnosis of hepatic abscess rupturing into the subdiaphragmatic region was made, surgical consultants confirmed the impression of amebiasis and administration of emetine with penicillin was begun on the same day

On May 21 a roentgenogram (fig 2) showed the entire right pulmonary field to be obscured by a homogeneous density with cardiac displacement to the left side Thoracentesis, done cautiously, yielded small amounts of clear sterile fluid which clotted rapidly and did not contain amebas Administration of emetine was discontinued after nine days and administration of carbarsone was begun Although the temperature was nearly normal, a second course of emetine was begun on June 4 because of persistent thoracic signs After the fourth daily dose there was a sudden onset of tachycardia (pulse rate 140), cyanosis and enlarged, tender liver Administration of emetine was discontinued Thereafter the course was smooth The patient was ordered to limited duty on Oct 3, 1945 with no complaints greatly improved in strength and regaining his normal weight rapidly Examination of stools remained negative for amebas

Ochsner and DeBakey stated that in a series of 2,490 reported cases of amebic hepatic abscess pleuropulmonary complications occurred in 15 8 per cent The same incidence occurred in 95 consecutive cases of amebic hepatic abscess admitted to the Charity Hospital and Touro Infirmary, New Orleans

In case 2 the predominance of thoracic signs and symptoms overshadowed the abdominal picture Berne[5] stated that this is true in about 30 per cent of cases The amebic hepatic abscess usually occurs high on the posterior aspect of the right lobe By a process of aseptic necrosis and inflammatory adhesion it may involve the diaphragm and pleura When rupture occurs, it may be directly into the bronchial lumens, less commonly into the pleural cavity Therefore a low lying pneumonitis of uncertain cause should excite suspicion of a subdiaphragmatic lesion

Case 2 emphasizes further that emetine is a toxic alkaloid, a protoplasmic poison with cumulative action and a strong affinity for muscle tissue, this accounts, probably, for the evidence of myocardial failure on the fourth day of the second course and the necessity for discontinuance of the drug

The presence of free pleural fluid of a clear, highly proteinaceous type indicated an impending or walled off rupture of the abscess below A surgical approach through the twelfth rib might have expedited the cure It was contemplated twice, but each time a little improvement postponed it Patience proved to be a virtue in this case

CASE 3—*Obstructing amebic granuloma of ileocecal region not responding to amebacides and treated by right hemicolectomy* In September 1944 a white seaman aged 27 was one of a small group who suffered from typical acute amebic dysentery by infection from a cyst-passing food handler The patient had severe diarrhea lower abdominal cramps and watery stools containing blood streaked mucus and amebas He was treated with emetine and carbarsone and was well in twenty-six days He did not receive enemas of chiniofon or other colonic irrigations

5 Berne C J Diagnosis and Treatment of Amebic Liver Abscess Surg Gynec & Obst **75** 235 238 (Aug) 1942

Three weeks prior to admission on April 19, 1945 he had a recurrence of diarrhea, profuse liquid reddish brown stools and lower abdominal cramps He received a course of 6 grains (0 4 Gm ) of emetine, which caused partial improvement

On admission the concentration of hemoglobin was 12 5 Gm in 100 cc. of blood Erythrocytes numbered 4,470,000 and leukocytes 9,850 in each cubic millimeter of blood Of the leukocytes 4 per cent were eosinophils Stools were negative for amebas until June 2, when a single doubtful positive result was obtained. Physical examination revealed severe tenderness over the course of the colon, particularly in the right lower quadrant. Sigmoidoscopy revealed pin point ulcerations in the rectum

The patient was treated in the gastrointestinal ward with courses of sulfathalidine and carbarsone over a long interval One seven day course of emetine hydrochloride was given in June and a ten day course in August After a temporary improvement he began to show increasing secondary anemia, and a discrete movable tumor mass appeared in the right lower quadrant. Stools were again liquid and numbered three to six daily Roentgenographic studies after administration of barium revealed a constrictive filling defect at the ileocecal junction

On September 12 the patient was transferred to the surgical service and was given a low residue diet and sulfathalidine, with vitamin concentrates On September 21, while he was under continuous spinal anesthesia, right hemicolectomy with side to side anastomosis was performed with the use of silk sutures The terminal ileum and cecum were found to be thickened and edematous, a mass having a diameter of 4 cm was present in the ileocecal junction The regional nodes were hyperplastic

Postoperatively the course was smooth Emetine was given (0 06 Gm ) for seven days and penicillin for eight days The patient was up in a chair the tenth day, and stools were

Fig 2 —Obscuration of right pulmonary field with cardiac displacement to left

reduced to two soft formed ones daily On October 10 the concentration of hemoglobin was 13 0 Gm per hundred cubic centimeters of blood, erythrocytes numbered 4,100,000 and leukocytes 7,100 in each cubic millimeter of blood The subsequent course was excellent

The pathologist described a chronic granuloma of the ileocecal juncture, with small superficial ulcerations in the ascending colon Scrapings of these ulcers did not show definite amebas (fig 3)

Although amebic granulomas are uncommon complications, several cases have been reported Such granulomas are most commonly located in the cecum or the sigmoid They are probably a phase of intercurrent secondary infection which may eventuate in chronic ulcerative colitis With repeated recurrences of the

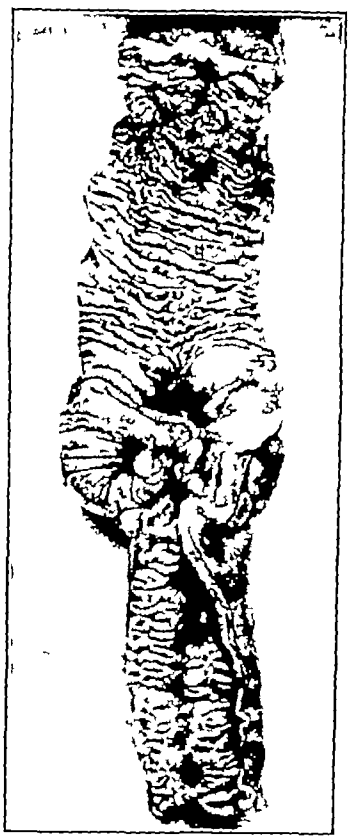

Fig 3 —Chronic amebic granuloma of the ileocecal juncture

infection, destruction of the bowel wall and fibrous tissue replacement occur, producing stenosis Granulomas are frequently multiple, usually amebas are not observed in them They simulate neoplasms strongly both in symptoms and in physical findings [6] They have been known to cause intussusception, obstruction [7] and gross bleeding Their surgical extirpation has in the past been fraught with high risk

An attempt should be made to eliminate a granuloma first by specific chemotherapy, frequently such treatment is unsuccessful Resection must be done with an accurate closed technic, the operation should be preceded and followed by amebacidal therapy The establishment of a colonic stoma is to be avoided among other things, amebic infection of the abdominal wall has been reported

One naturally raises the question as to whether local treatment of the large bowel at the time of first infection might have prevented a recurrence and the late complication in case 3 The experience of British and American physicians in the China-Burma-India campaigns suggests that direct treatment of the bowel by oxyquinoline drugs is necessary after the control of the

6 Donald C J Jr and Brown P W Amebic Granuloma Simulating Carcinoma of the Rectum Proc. Staff Meet Mayo Clin 15: 321 323 (May 22) 1940

7 Likely D S and Lisa J R Granuloma of the Large Intestine Associated with Amebiasis New York State J Med. 42 2322 2323 (Dec 15) 1942

acute phase with emetine[8] Emetine has a remarkable clinical effect on the acute disease but clears the bowel of all parasites in only 15 per cent of cases

CASE 4—*Recurring amebic hepatic abscess responding to administration of emetine and penicillin* A white veteran aged 25, admitted on Aug 18, 1945 with a diagnosis of cholecystitis and empyema of the gallbladder, complained chiefly of pain in the right upper quadrant of the abdomen

He had been discharged from an army hospital in July 1945 after ninety days' hospitalization for a subdiaphragmatic abscess on the right side At that time he had returned recently from the tropics but had not had an antecedent operation or acute abdominal illness Penicillin therapy, aspiration and emetine were followed by resection of the twelfth right rib and drainage of a large hepatic (?) abscess

One week before admission he was discharged from the Army The same day he began to have pain in the epigastrium and right upper quadrant Four days before admission, increasing fever was noted

Physical examination on admission revealed a temperature of 102 F rising to 104, a pulse rate of 92 and a respiratory rate of 28 There was a scar of previous rib resection in the right lower posterior aspect of the thorax, with deep tenderness and slight fulness beneath it Leukocytes numbered 11 700 in each cubic millimeter of blood, with 67 per cent of neutrophils A roentgenogram of the thorax showed an enlarged hepatic shadow an elevated right diaphragm and pneumonitis at the right base Sigmoidoscopy was negative for ulcerations

Administration of penicillin was begun August 19 and of emetine August 21 The temperature was normal on the eighth day and remained so thereafter Tenderness and fulness under the thoracotomy scar disappeared Elevation of the right hemidiaphragm subsided progressively, and aeration at the right base improved The patient was discharged on the twenty-fourth hospital day

In case 4 the diagnosis is certainly not proved, but it is strongly presumptive for amebic abscess, residual or recurrent in the liver This case illustrates one danger of external surgical drainage such as is usually employed for pyogenic abscess An amebic hepatic abscess is almost always sterile to ordinary culture, but it does not remain so after external drainage and the advent of dermal pyogenic contaminants When external drainage becomes necessary great care must be taken that the cavity be closed before the drainage tube is removed The triad of enlarged tender liver, high diaphragm and basilar pneumonitis is illustrated by this case

Combined treatment with penicillin and emetine gave a rapid and excellent result It was felt that the therapeutic test was preferable to surgical reexploration as long as one kept in mind the possible toxic manifestations of the drug employed

SUMMARY

In 3 cases of amebic hepatic abscess and 1 of amebic granuloma of the cecum occurring among personnel of the Army or Navy the use of amebacides, especially emetine, was of great value as a preliminary to aspiration of the abscess in 1 case and in the conservative treatment in 2 cases In 1 of these cases perforation of the abscess through the diaphragm (nonsurgical) to the pleuropulmonary region occurred and in the other a right hepatic abscess recurred after open drainage In 1 case the obstructing amebic granuloma in the ileocecal region was not affected by emetine and right hemicolectomy was performed The result was successful

8 Circular Letter No 24 British Medical Liaison Officer Carlisle Barracks, Pa Oct 17 1945

## LIFE EXPECTANCY IN ANGINA PECTORIS

ROBERT L PARKER, M D
THOMAS J DRY, M D
FREDRICK A WILLIUS, M D
and
ROBERT P GAGE M S
Rochester Minn

In recent years there has been a gradual change in the conception of the prognosis of patients who have angina pectoris As additional follow-up studies are recorded, one may note a favorable lengthening of the average survival period of patients who have this disease[1] No one would wish to contend that the diagnosis of coronary sclerosis with angina pectoris does not carry with it an element of seriousness and insecurity which usually necessitates a decided modification of the patient's manner of living However, there is now reason to believe that the average patient who has angina pectoris may anticipate a longer survival than was thought reasonable to predict a few years ago Investigations of the pathologic characteristics of coronary heart disease have led to an increased appreciation of the amazing extent to which the heart is capable of readjusting itself to pathologic processes involving the coronary blood vessels, even though the natural tendency of these processes may be one of progression

Unless the physician has the unique opportunity of observing personally a group of anginal patients sufficiently large to allow for statistical accuracy and of following their course until all have died, he cannot know the average duration of life in that group Such an analysis is seldom possible Recently, however, White, Bland and Miskall have reported a follow-up study of 497 cases of angina pectoris observed over a period of twenty-three years in which only 52 patients still survived The average duration of the disease for the 445 who died was 7 9 years The average duration of the disease for patients still living was 18 4 years As the mortality rate of the patients still living remains a question, the true figures indicating the mortality rate of the whole group cannot be determined, yet this report no doubt represents the most accurate and complete study made of this type

### METHOD OF STUDY

A follow-up study was conducted on all patients examined at the Mayo Clinic from Jan 1, 1927 to Dec 31, 1936 inclusive for whom a diagnosis of angina pectoris was made Those patients whose records did not contain adequate information as to survival were traced by letter There were 3,440 cases which formed the basis of this statistical analysis The data obtained from these records were analyzed with the assistance of the Division of Biometry and Medical Statistics For the most part the method used in the calculation of survival rates was that employed in actuarial prac-

From the Section on Cardiology (Drs Parker, Dry and Willius) and the Division of Biometry and Medical Statistics (Mr Gage) Mayo Clinic.

1 Herrick, J B and Nuzum F R Angina Pectoris Clinical Experience with 200 Cases J A M A. **70** 67 70 (Jan 12) 1918 Mackenzie James Angina Pectoris London Henry Frowde and Hodder & Stoughton 1923 White P D The Prognosis of Angina Pectoris and of Coronary Thrombosis J A M A **87** 1525 1530 (Nov 6) 1926 White P D and Bland E F A Further Report on the Prognosis of Angina Pectoris and of Coronary Thrombosis A Study of 500 Cases of the Former Condition and of 200 Cases of the Latter, Am Heart J **7**: 1 14 (Oct.) 1931 Eppinger E C and Levine S A. Angina Pectoris Some Clinical Considerations, with Special Reference to Prognosis Arch. Int Med **53**: 120-130 (Jan.) 1934 White, P D Bland E F and Miskall E W The Prognosis of Angina Pectoris A Long Time Follow Up of 497 Cases Including a Note on 75 Additional Cases of Angina Pectoris Decubitus J A. M A **123** 801-804 (Nov 27) 1943

tice[2] This method is governed by mathematical laws which allow computation of the desired data as to survival rates even though a considerable number of the patients falling within the scope of our study were still living at the time the investigation was conducted The data submitted for analysis were under date of Jan 1, 1942, allowing a minimal known survival period of at least five years for those patients still living

Granted that statistical studies of survival in such a condition as coronary sclerosis with angina pectoris do not make available data with which one can predict with accuracy the prognosis in any individual case, such a study as this does give an opportunity to evaluate better what influencing factors contribute toward a favorable or unfavorable prognosis

Information which was available from these records and which seemed pertinent to the determination of survival rates included the duration of symptoms (the anginal syndrome) prior to the time the diagnosis was made at the clinic, the age and sex of the patient, the presence or absence of associated hypertension and its severity, the presence or absence of cardiac hypertrophy, congestive heart failure, data as to the development of previous or subsequent coronary thrombosis with cardiac infarction and the presence or absence of significant electrocardiographic abnormalities

### AGE DISTRIBUTION

The average age of the patients at the time of onset of the anginal syndrome (table 1) was 57 1 years The youngest patient was 22 years and the oldest 92 years of age The average age of women (58 0 years) was slightly greater than that of men (56 9 years) Eighty-eight per cent of the patients were included in the age groups from 40 to 69 years Only 3 6 per cent of all patients were younger than 40 years of age, and 8 per cent were 70 years of age or older

Analysis of the patients' histories indicated that the syndrome of angina pectoris had been present prior to the time of their examination at the clinic for periods varying from a few days to eighteen years The majority of patients had suffered with angina pectoris for a period of two years or less prior to their examination This group included 2,555 patients (74 3 per cent) Ninety-eight patients (2 8 per cent) had had symptoms of angina pectoris for ten years or more prior to the time of examination (A considerable number of patients in this group had been examined at the clinic in years prior to the period of this study [1927 to 1936 inclusive] and the diagnosis of angina pectoris had been made, but these patients were reexamined and the diagnosis was confirmed during the period included in this survey )

TABLE 1—*Age of Patients at Time of Onset of Angina Pectoris According to Sex*

| Age Years | Total Number | Total Per Cent | Males Number | Males Per Cent | Females Number | Females Per Cent |

### SEX DISTRIBUTION

Table 2 gives the age and sex distribution at the time of our diagnosis of angina pectoris Of the entire group there were 2,794 men and 646 women, giving a ratio of 4 3 1 In comparing the sex distribution by age at the time of examination there does not seem to be any consistency in the ratio of male patients to female patients, the ratios being for the fourth decade 3 2 1, for the fifth decade 6 8 1, for the sixth decade 4 8 1, for the seventh decade 3 5 1 and for the eighth decade 4 3 1 The number of cases in the third and ninth decades is hardly sufficient to allow for statistical evaluation In the fifth decade the male patients represented 16 1 per cent of the total male group and the female patients represented 10 2 per cent of the total female group Considering the general impression of infrequency of occurrence of angina pectoris among women less than 50 years of age, 10 2 per cent may seem amazingly high In all probability details of these cases would reveal evidence of associated vascular disease due to hypertension in a higher percentage of this group which would tend to predispose them to the early development of coronary insufficiency

TABLE 2—*Age of Patients at Time of Diagnosis of Angina Pectoris According to Sex*

| Age Years | Total Number | Total Per Cent | Males Number | Males Per Cent | Females Number | Females Per Cent |
|---|---|---|---|---|---|---|
| 20-29 | 8 | 0 1 | 2 | 0 1 | 1 | 0.2 |
| 30-39 | 59 | 1.7 | 45 | 1 6 | 14 | 2.2 |
| 40-49 | 517 | 15 0 | 451 | 16 1 | 66 | 10.2 |
| 50-59 | 1,220 | 35.5 | 1 008 | 36 1 | 212 | 32.8 |

| 90-99 | 1 | * | 1 | * | 0 | 0 |
| Total | 3 440 | 100 | 2 794 | 100 | 646 | 100 |
| Mean age | 59 1 yrs | | 58 8 yrs | | 60.2 yrs | |
| Youngest | 28 yrs | | | | | |
| Oldest | 92 yrs | | | | | |

* Less than 0 1 per cent

In the age groups of 60 years and older there was a total of 46 1 per cent of the total male group as compared with 54 6 per cent of the total female group Although this difference is not great, it does add confirmation to the impression generally accepted that coronary disease in women is likely to become manifest at a later average period of life than in men

### SURVIVAL RATES IN CASES OF ANGINA PECTORIS

In the upper portion of chart 1 are shown the percentages of patients having angina pectoris who survived for the specified numbers of years after onset of the anginal syndrome In the lower portion of chart 1 are shown the percentages of patients who survived for the specified numbers of years after the diagnosis of angina pectoris had been made at the clinic Both curves are compared with the survival curves of normal populations of similar age and sex distribution

These curves clearly show that the survival rate in each instance is much less than that of the normal

2 Berkson Joseph The Calculation of Survival Rates in Walters Waltman Gray H K and Priestley J T Carcinoma and Other Malignant Lesions of the Stomach Philadelphia, W B Saunders Company, 1942 chapter 22 pp 467-484

population It is of particular interest to note that from year to year the rate of survival remains nearly constant The steepest descent in the survival curve, indicating a higher mortality rate, is seen in the first year following the time of diagnosis (lower portion of chart 1) During this year 18 per cent of the patients succumbed or, in other words, there was a survival rate for the first year of 82 per cent In contrast to this figure, during the first year from the time of onset of symptoms of angina pectoris the survival rate was 94 per cent, or the mortality rate was 6 per cent More clearly, perhaps, these figures indicate that, of every hundred patients having angina pectoris at an average age of 57 years, 5 or 6 would succumb during the first year from the time symptoms first developed while 18 patients of each hundred at an average age of 59 years would succumb to the disease during the first year subsequent to the date when they presented themselves at the clinic for examination By the end of the second year after diagnosis we find that of each hundred patients 27 will have succumbed, in comparison to a mortality rate of 4 7 for the average population From year to year thereafter the survival curve indicates a rather constant mortality rate of approximately 10 per cent among the survivors

## SURVIVAL RATES AMONG PATIENTS OF DIFFERENT SEX

That the women who have angina pectoris tend to survive longer than men who have angina pectoris has long been the accepted opinion of most physicians Further confirmation of this opinion is presented in this study In table 3 and the lower part of chart 1 the survival rates of all patients according to sex as compared with the total series and the normal population are presented These survival rates were determined as of the time when the diagnosis of angina pectoris was established by examination at the clinic It is

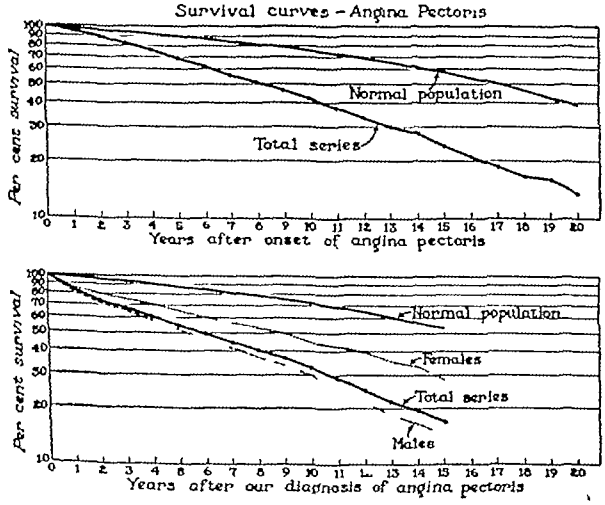

Chart 1 —Survival curves of patients who had angina pectoris and of a normal population of the same age and sex distribution

clearly shown that from the first year through the fifteenth year the survival rate of women who have angina pectoris is consistently and increasingly higher than that of the male group of patients This greater survival rate of women than of men raises many questions regarding the etiology of vascular degenerative changes for which so far no adequate explanation is available

## FIVE YEAR SURVIVAL RATES AMONG PATIENTS OF DIFFERENT AGE GROUPS

In table 4 are presented the five year survival rates according to age of patients at time of examination, based on a review of data for 2 827 traced patients Since only the five year survival rates were desired for comparison at the various age levels the actuarial method of calculation was not employed In such instances a more direct method of computation seems advisable and the table illustrates the method The last column in the table gives the survival rates for each decade after an adjustment has been made for the normal death rate

TABLE 3—*Survival Rates of Patients, According to Sex, Having Angina Pectoris*

| Interval Following Time of Diagnosis at Clinic Years | Last Report Dead | Last Report Living | Total Persons Living at Beginning of Interval | Person Years Exposed | Probability of Dying in Interval | Survival Rate per Cent |

| 14 15 | 3 | 7 | 24 | 20 5 | 0 1463 | 33 1 |
| 15+ | 3 | 11 | 14 | | | 28.3 |

Although the calculations were carried out for the groups less than 30 years and for those 80 years of age or more, the paucity of data does not allow a proper interpretation for these age groups The average five year survival rate for the entire group was 53 2 per cent, indicating that of each hundred patients 47 have succumbed before the end of the fifth year from the time the diagnosis was established and 53 patients were known to be alive at the end of this period The survival rates for the fifth and sixth decades were more favorable than for the fourth decade of life If, however, we adjust this survival rate to eliminate the effect of deaths from other causes than angina pectoris, we obtain the information that the rates from the fifth decade to the eighth decade inclusive are more favorable than the rate for the fourth decade We think this finding is of special significance and this must necessarily alter the general interpretation by physicians regarding the favorable influence of youth on the prognosis of patients having coronary sclerosis and angina pectoris It is well known that the mortality rate following acute coronary thrombosis is much lower in the younger age groups than in later decades,

yet it would seem from this survey that the mortality rate of patients having the anginal syndrome in the fourth decade is higher than in the later years of life

It has been our impression that, when coronary heart disease with the anginal syndrome becomes manifest among patients in the fourth decade of life or earlier it is most often precipitated by an acute coronary closure Less often do we obtain a history of gradual progressive anginal distress on exertion among such patients but rather more dramatic incidents indicative of impending, if not already actual, infarction The patient who has the anginal syndrome in the fourth decade of life or earlier is likely to be one who has previously sustained myocardial damage, whereas the older patient is likely to present a history indicative of more gradual development of coronary insufficiency This may to some extent explain our finding of a lowered survival rate among young patients who have angina pectoris

## FACTORS INFLUENCING PROGNOSIS FIVE YEAR SURVIVAL STUDIES

*Cardiac Hypertrophy*.—Regardless of the cause of the cardiac lesion in question—whether it is rheumatic heart disease, congenital heart disease or coronary heart disease—it has long been appreciated that the factor of cardiac hypertrophy plays an important role in the evaluation of the ability of the heart to withstand the effects of such a disease process In this study we established further confirmation of the importance of the finding of cardiac enlargement in influencing the survival rates of patients who had angina pectoris

In table 5 the five year survival rates of patients who had cardiac enlargement as determined both by clinical and by teleoroentgenographic examination are compared with the survival rates of those who did not have cardiac enlargement Again the calculation of the five year survival rates was made by the direct method The five year survival rate of patients who had no

* Inquiry as of Jan 1 1942 Included here are cases in which the diagnosis was made five or more years prior to the time of inquiry, that is in 1936 or earlier

clinical or roentgenographic evidence of cardiac enlargement was 62 1 per cent, whereas the corresponding rate for those patients who had associated cardiac hypertrophy was only 38 8 per cent

*Hypertension*.—Since the presence of associated hypertension in cases of coronary heart disease is the primary factor in the causation of cardiac hypertrophy, one might well expect that the five year survival rate for patients who had angina pectoris and associated hypertension would be less than that of patients who had angina pectoris without hypertension This we found to be the case The five year survival rate of patients without hypertension was 60 6 per cent as compared with a five year survival rate of 46 1 per cent for patients who had associated hypertension

TABLE 5.—*Five Year Survival Rates of Patients Having Angina Pectoris According to Factors Influencing Prognosis*

| | Total Patients* | Traced Patients | Lived Five or More Years Following Diagnosis at Clinic: Number | Lived Five or More Years Following Diagnosis at Clinic: Per Cent of Traced Patients |

| Subsequent cardiac infarction | 144 | 140 | 51 | 36.4 |
| Congestive heart failure | 200 | 189 | 31 | 16.4 |

* Inquiry as of Jan 1, 1942 Included here are cases in which the diagnosis was made five or more years prior to the time of inquiry, that is, 1936 or earlier.

It would likewise be anticipated that the severity of the associated hypertension would reflect itself in the survival rates of patients who had angina pectoris For a number of years it has been our policy to classify patients having essential hypertension into groups based primarily on the degree of vascular changes in the retinal arteries as seen on funduscopic examination It may be seen from table 5 that the five year survival rate decreased as the severity of hypertension increased

The importance of the factors of hypertension and cardiac hypertrophy in the determination of the ultimate failure of the heart of the anginal patient has long been appreciated and the foregoing figures tend to emphasize this point further, yet clinical experience shows that the anginal patient without clinical evidence of cardiac hypertrophy or hypertension may succumb to the disease even at an early date after the onset of the anginal syndrome It would seem that the heart laboring under the burden of both hypertension and coronary sclerosis can remain compensated through hypertrophy only as long as the coronary circulation will allow it to maintain a minimal requirement of nutrition

It has been the impression of ophthalmologists that arteriosclerotic changes involving the choroidal arteries as seen on funduscopic examination are a reflection of the degree of arteriosclerotic changes in other systemic arteries, including the coronary arteries The five year survival rate of 126 traced patients in whose eyes an ophthalmologist noted choroidal arteriosclerosis of a significant degree on funduscopic examination was 42 1 per cent The average age of this group of patients who had choroidal arteriosclerosis was 64 years The five year survival rate for all patients in the seventh decade was 51 4 per cent The decrease of the survival rate of patients who have choroidal arteriosclerosis as compared with the rate for all patients of approximately the same age tends to corroborate the impression that choroidal arteriosclerosis reflects advanced systemic arteriosclerosis

Most physicians have obtained a clearer overall picture of the problem of coronary heart disease since the enlightening studies of the pathologic changes of coronary heart disease made by Blumgart Schlesinger and Davis[3] They have come to realize that closure of coronary vessels has already occurred in the majority of patients who present the syndrome of angina pectoris whether or not a critical survey of the patient's history would indicate any one or more episodes which could be interpreted according to classic criteria as acute coronary thrombosis That cardiac infarction may occur in the absence of complete closure of a coronary artery is also known to be true More evidence is accumulating to dispel the previous assumption that coronary disease represents a disease of unrelenting progression Instead, physicians have come to realize that its progression is characterized more often by periods of crisis initiated by sudden partial or complete occlusive episodes and then followed by periods of recession of symptoms associated with revascularization and healing Even though the progression of coronary disease in most cases of angina pectoris is punctuated by episodes of coronary occlusion with or without cardiac infarction and many such episodes go unrecognized clinically, it would seem reasonable to assume that when a person who has angina pectoris has suffered an attack recognized clinically as occlusion with cardiac infarction and has recovered from the acute phase of this illness his probability of survival for a given period would be decreased Of the patients whose examinations indicated that they had sustained previous coronary thrombosis with cardiac infarction the five year survival rate was 45 2 per cent as compared with the average survival rate of 53 2 per cent Of the patients who had sustained a subsequent coronary occlusion the five year survival rate was only 36 4 per cent

*Congestive Heart Failure*—It has been a common assumption that the prognosis is extremely unfavorable in those cases of angina pectoris in which congestive heart failure develops and this assumption is supported by data recorded in this study The five year survival rate for patients who had congestive heart failure at the time of their examination at the clinic was only 16 4 per cent The five year survival rate of patients who had congestive failure, regardless of etiology, is 30 per cent as reported by Dry[4]

*Influence of Abnormal Electrocardiographic Changes on the Survival Rates*—Although one must be constantly aware of the limitations of the electrocardiogram in the diagnosis of coronary disease no one can seriously doubt its importance as a diagnostic aid especially in this field of cardiology Even though certain changes in the electrocardiogram may confirm the clinical impression of the presence of coronary disease, it has been emphasized time and again that these changes do not necessarily constitute a measure of the functioning myocardium and thus do not constitute definite prognostic criteria in the individual case In a study such as this, however, it is of interest to determine the course with regard to the survival of patients with angina pectoris having significant electrocardiographic abnormalities as compared with those who have normal electrocardiograms

The cases were divided into three main groups (1) those in which the electrocardiograms were normal or had only minor abnormalities not considered significant, (2) those with significant T wave negativity or Q wave changes or both[5] and (3) those with significant conduction disorders[6]

The survival curves for these three groups, presented in chart 2, demonstrate a well defined decrease of the survival rates among the patients who had significant electrocardiographic changes in comparison with the group whose tracings were normal

During the first year after diagnosis there was a survival rate of 89 per cent in the group in which the tracings were normal as compared with the group with T wave negativity and Q wave changes in which the survival rate was 76 per cent, and 68 per cent in the group with conduction disorders From the first year on, the survival curves in the groups with positive electrocardiographic changes tend to parallel one another with approximately a consistent decrease of survival rate of about 10 per cent in the group with conduction defects in comparison to the T and Q wave groups

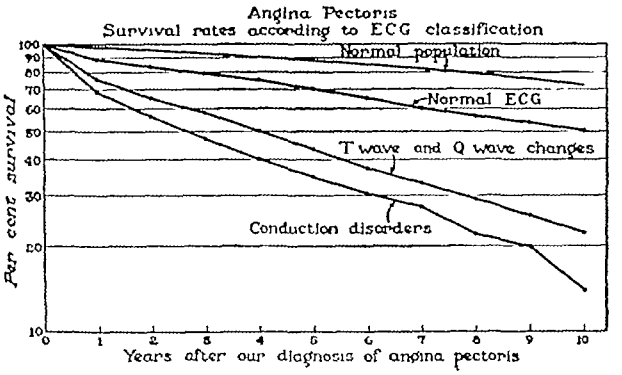

Chart 2.—Survival curves of patients who had angina pectoris classified by their electrocardiographic characteristics

Both these curves diverge at a fairly uniform rate from the survival curve of the normal group At the end of five years 70 per cent of the group who had normal electrocardiograms were living as compared with a survival rate of 43 per cent for the T and Q wave group and of only 35 per cent for the conduction defect group At the end of ten years, of each hundred patients having angina pectoris whose examination disclosed a normal tracing 50 still survived, of 100 patients whose electrocardiograms showed T wave negativity or prolonged $Q_3$ pattern 22 were still alive, but only 14 patients of each hundred who had conduction disorders survived the ten year interval One may reasonably conclude from these survival rates that the finding of positive electrocardiographic changes of the type included in this study is indicative of a much poorer chance of survival than that of the average patient who has angina pectoris

In table 6 are recorded the five year survival rates of patients who had various types of electrocardiographic abnormalities This table is similar to those previously recorded for survival rate by age groups,

6 Prolonged auriculoventricular conduction bundle-branch block (concordant, discordant and wide S wave types) complete auriculoventricular dissociation

hypertension groups, cardiac hypertrophy and so forth Included here are only cases in which the diagnosis was made five or more years prior to the time of follow-up inquiry Perhaps the most significant finding in table 6 is the large number of cases in which the electrocardiograms were normal If the group in which left axis deviation was the only electrocardiographic abnormality is combined with the normal group, a total of 1,370 cases, or 40 per cent of the total cases reviewed, had no significant electrocardiographic changes The reasonableness of including those cases with only left axis deviation in the normal group is confirmed when we note that the survival rate in the two groups for the five year interval was almost identical, 69 3 per cent and 69 5 per cent respectively

The five year survival rate for the group of patients having T wave negativity in lead 1 was almost twice as favorable as for the group having T wave negativity in both leads 1 and 2, 42 7 per cent and 22 4 per cent respectively That the five year survival rate in the group having T wave negativity in all three standard leads should be considerably better (38 6 per cent) than the survival rate of those patients having negative $T_1$ and $T_2$ is an unexpected finding provocative of explanation Since no attempt was made, however, in this review to study in detail the types of cases falling into each group, we cannot at this time suggest what other factors may have been present to alter the survival rate in this or any other group recorded here

TABLE 6—*Five Year Survival Rates of Patients Having Angina Pectoris According to Electrocardiographic Classification*

| Results of Electrocardiogram | Total Patients* | Traced Patients | Lived Five or More Years Following Diagnosis at Clinic | |
|---|---|---|---|---|
| | | | Number | Per Cent of Traced Patients |
| Normal | 629 | 483 | 300 | 69 3 |
| Left axis deviation | 841 | 679 | 472 | 69 5 |
| Total | 1 370 | 1 112 | 772 | 69 4 |

| Right bundle-branch block | 6 | 5 | 2 | 40 0 |
| Wide S wave | 28 | 25 | 14 | 56 0 |
| Complete heart block | 4 | 4 | 1 | 25 0 |
| Delayed auriculoventricular conduction | 73 | 67 | 21 | 31 3 |
| Auricular fibrillation | 70 | 57 | 10 | 17 5 |

* Inquiry as of Jan 1 1942. Included here are cases in which the diagnosis was made five or more years prior to the time of inquiry, that is in 1936 or earlier

T wave negativity was the most common significant electrocardiographic abnormality noted and was found in approximately half of the cases It would seem that patients having T wave negativity in leads 2 and 3 and those having a Pardee Q pattern in lead 3 had a slightly more favorable survival record than those having T wave changes in lead 1 or leads 1 and 2

As was previously noted in the determination of the survival curves by the actuarial method, we find in table 6 that in general the five year survival rate of patients having conduction disorders is less than the survival rate of those having T wave negativity However, there is one exception which demands emphasis and that is the relatively favorable five year survival rate (56 per cent) of patients having the wide S wave type of bundle-branch block The corresponding survival rates in left concordant and left discordant bundle-branch block were 31 per cent and 32 per cent respectively This we believe again serves to stress the clinical importance of not confusing the wide S wave type of conduction pattern with other types of bundle-branch block [7]

The lowest five year survival rate (highest mortality rate) of any of the groups listed is found among the patients having auricular fibrillation Of this small group only 17 5 per cent were alive at the end of five years As auricular fibrillation is likely to be a late development in the course of coronary heart disease and is most often associated with congestive heart failure, a low survival rate would have been anticipated for this group

Probably the most significant finding of the electrocardiographic survey included in this study is the large proportion of patients (40 per cent) whose electrocardiograms were within the limits of normal variation at the time a positive diagnosis of angina pectoris was made Studies of survival curves and five year survival rates of traced patients indicate that when significant electrocardiographic abnormalities are found among patients having angina pectoris the survival rates are considerably reduced

## SUMMARY

The survival rates of patients having the anginal syndrome of coronary arterial disease were determined for a group of 3,440 patients examined at the Mayo Clinic over a period of twenty years The data obtained from this study were analyzed critically in the Division of Biometry and Medical Statistics Follow-up letters were sent to all patients when our records did not contain the latest information regarding their status at the time of analysis of the data All survival rates of these patients were compared with the survival rates of a comparable group of the normal population having the same age and sex distribution This control is obviously the necessary yardstick for comparative study

The average age of onset of the anginal syndrome was slightly earlier for men than for women While there was wide variation in age of the patients at the onset of symptoms, 88 per cent of the patients were in the fifth, sixth and seventh decades of life The ratio of men to women was 4 3 1

The highest mortality rate occurred in the first year following the establishment of the diagnosis of coronary arterial disease with angina pectoris Thereafter the yearly mortality rate was less although it continued relentlessly yearly throughout time

The survival rates of women having the anginal syndrome are greater than those of men

When corrected for deaths not due to angina pectoris, the five year survival rate of patients 30 to 39 years of age with the anginal syndrome is definitely shorter than when the disease manifests itself later in life

Such associated conditions as cardiac hypertrophy, well defined hypertension, previous cardiac infarction, congestive heart failure and significant electrocardiographic abnormalities are clearly related to a higher mortality rate and lower survival rates

# THE SYNDROME OF AIRBLAST CONCUSSION CEREBRAL

COMMANDER ROBERT S SCHWAB (MC), U S N R

In the first world war the syndrome of shell shock was given considerable prominence in the medical literature The symptoms of the condition identified with this diagnosis were supposed to have been produced by the blast effect of nearby exploding shells on the human brain It was thought that the force of the blast transmitted through the air and into the cranial cavity disarranged the cytoarchitecture of the cortex by some sort of molecular disruption and that the brain so damaged produced the clinical signs that were associated with the condition These were extreme irritability, pronounced startle reaction bizarre tremors and automatic movements, some loss of memory, headaches and a decided drop in efficiency The absence of neurologic signs with these symptoms and the total absence of other data that would indicate structural damage to the brain caused many at the time to doubt that these effects were due to the physical energy of the blast The production of these identical symptoms by other factors than nearby explosions such as a violent disruptive death of a companion or some other horrible emotional experience as well as the successful therapy in many of these cases by purely psychiatric procedures finally reduced shell shock to the category of a severe hysteric-anxiety syndrome and the term fell into disrepute

The reviews by Viets [1] in 1917 and the articles by Myers [2] in 1915-1916, Bailey [3] in 1918, Southard [4] in 1917, Mott [5] in 1916 and the final report in the Army Medical Department, volume X,[6] in 1929 cover the problem in World War I and leave the reader definitely with the impression that the majority (95 per cent) of so-called "shell shock" cases showed no evidence of damage or changes in the central nervous system

For example, in the report of the United States Army Medical Department [6] of 1,003 cases of so-called "shell shock" in a neurologic hospital only 10 showed any neurologic signs and were finally kept as brain concussion cases The rest were termed war neuroses and were handled as such

Mott reported some pathologic material found in men killed near explosions Reading of his three papers, which, incidentally, have been misquoted in modern reviews, reveals that his main contention was that a man buried in a deep dugout by a shell blast could die from the carbon monoxide concentration in the enclosed space, and his lesions bear this out He readily concedes that the majority were cases of acute hysteria—often in predisposed vulnerable personalities

In this war as a result of the intensive bombing and greater destructive power and size of the explosives used, the world blast concussion appeared in the medical literature in 1940 It was supposed, as in the first world war, that the effect from these gigantic bomb blasts would result in direct damage to the brain Various articles have been published on this syndrome, and it is an accepted diagnostic term in both our army and our navy

In this war, strangely enough, the same sort of clinical arguments and reports appeared Preliminary and sketchy reports suggested that air blast could damage the human brain, such as the few cases of Abbott and Due [7] in 1943, but the careful, full reviews of Denny-Brown [8] and of Fulton [9] and the experimental work of Zuckerman [10] show that little if any evidence exists for brain damage and that careful microscopic studies fail to show that air blast in the open can harm the human nervous system

Fabing [11] has published a careful report of over 80 cases of this syndrome in which he failed to find organic brain injury His explanation of the symptom complex on Pavlovian terms of overstimulation of the cerebral cortex is a possible way to explain the syndrome

This report deals with clinical observations on some 350 patients seen in the Pacific theater in 1944-1945 who were admitted to naval hospitals with a diagnosis of concussion atmospheric cerebral

The first large group of cases observed were in a naval hospital in the Hawaiian Islands to which over 100 cases bearing this diagnosis were admitted The second group, consisting of 105 cases from Iwo Jima and the third group of 150 cases received during the Okinawan campaign were both seen at Guam A smaller group of some 25 cases from the Bougainville campaign were examined in a hospital in the New Hebrides I saw about a dozen patients with this diagnosis at the Chelsea Naval Hospital in 1943, having received their initial blast effect in the previous year on Guadalcanal

Since all these patients had been exposed to the near blast of either bomb or shell explosions, it might be well at this point to describe the general effect of an air blast in the open and relate some personal observations about it

I had an opportunity for some temporary duty on a heavy cruiser which was engaged in battle practice involving considerable use of 8 inch guns It was possible to be stationed, since this was not a real battle condition, on the wing of the bridge some 20 feet from the 8 inch guns during broadside fire In view of the damage to ear drums from such proximity to these discharges careful application of cotton to the auditory canals was insured The primary objective here was to note the pure blast effect and whether it would produce headache or other uncomfortable sequelae There was no danger, of course, from such a position of being injured by any fragments For the better part of a day and one evening I stood by the guns to observe the effect of these blasts, which, in spite of the cotton in the ears, was exceedingly unpleasant The force of the air wave would push one about and tear open one's shirt. A pair of spectacles were blown off in one

This article has been released for publication by the Division of Publications of the Bureau of Medicine and Surgery of the U S Navy The opinions and views set forth in this article are those of the writer and are not to be considered as reflecting the policies of the Navy Department

of the blasts The incandescent yellow flash when observed directly in the daytime rendered the eye temporarily blind for thirty to forty seconds When observed once during the night, with the pupils dilated temporary blindness lasted for about four and one-half minutes No headache or any other somatic disturbances were noted The intensity of the blast effect was calculated by an ordnance expert as being about the same as that of a 100 pound bomb or shell exploding at the same distance

As a result of this observation it seemed unreasonable that the pure blast effect would injure the brain in the cases observed The nature of the blast wave is such that in the open atmosphere the compression effect is rapidly dissipated so that a few yards away from the exploding missile the crushing effect of the air pressure has diminished to a degree that prevents it from damaging a structure like the cranium The compressing effects, however, if intense enough, could crush soft organs containing air or fluids One would therefore suppose that, if the brain is damaged by such an effect, there must always be extensive damage to the lungs viscera, blood vessels eyeballs and sinuses The ear drums, *which respond to such pressure readily, would* always be ruptured in such cases Now this is not the case In 90 per cent of these cases seen the ear drums

*Comparison of Findings in Conditions Related to Air Blast Concussion*

| Findings | So Called Air Blast Concussion | Battle Neurosis | Head Injury | True Air Blast Concussion |
|---|---|---|---|---|
| Headache | + | + | + | + |
| Tinnitus | + | + — | + | + |
| Hearing loss | 0 | 0 | 0 | + |
| Focal neurologic signs | 0 | 0 | + | + |
| Spinal fluid abnormality | 0 | 0 | + | + |
| Ruptured ear drums | 0 | 0 | 0 | + |
| Rupture of other viscera | 0 | 0 | 0 | + |
| Retrograde amnesia | 0 | 0 | + | + |
| Pentothal recoverable amnesia | + | + | 0 | 0 |
| Tremors + startle | + | + | 0 | 0 |
| Terror nightmares | + | + | 0 | 0 |

were intact In all but 3 of the cases observed there was no evidence of blast effect in the other organs previously mentioned Furthermore, in the 3 cases just mentioned the blast did not occur in the open but took place in a confining space where the pressure effect could not be dissipated and which therefore might be expected to produce compression effects on the brain The neurologic examinations in all 3 just mentioned were definitely abnormal

On the other hand in well over 300 cases bearing this diagnosis the neurologic examination was within normal limits, indicating no clinical evidence of cerebral damage In a small group of 15 the spinal fluid was under normal pressure, free of red cells or increase in protein In a larger series of 75 not seen by me but reported verbally by Lieutenant Commander Fogel of the U S S *Bountiful* the spinal fluid was normal in all

About 40 per cent of these men complained of a definite period of amnesia lasting anywhere from thirty minutes to thirty hours It is this amnesia which has led many clinicians to the conclusion that there must be cerebral damage present An analysis of this amnesia in this group of cases reveals the following There was no retrograde amnesia in any of the cases Retrograde amnesia is usually found in damage to the brain from skull injury In fact the amnesia usually reported began after the subject had heard the explosion and felt himself pushed down by its effect In all cases in which the amnesia was explored by means of narcosynthesis (pentothal) or hypnosis restoration of the memory was possible

It is interesting to note here that so-called narcosynthesis, described in great detail by Grinker[12] in 1944, was in effect reported in 1916 by Penhallow,[13] the patient being a soldier who lost his speech, sight and memory from a nearby shell explosion on the Western Front in July 1915 In October of that year in a hospital in Paris he was given ether, regained his speech and sight and relived in a loud voice his entire battle experience in a dramatic way before the examiner and filled in completely the three months old amnesia Penhallow reported that the patient was quite well thereafter

This is not considered characteristic of the amnesia found in cerebral damage In many cases the amnesic material presented a serious panic state with complete loss of control, violent fear reactions and surrender to the flight impulse Naturally, in well trained fighting men such behavior produces intense guilt and shame, so intense that unconscious burial by means of amnesia is the only way out In a number of these cases exploration of the amnesia revealed a period of recall that ended shortly after an injection of morphine or barbiturates This medication then produced a natural sleep which could not be further explored and certainly could not be explained by any means as a result of damage to the brain but rather the normal effects of strong sedation Comparison of the findings in true air blast concussion head injury, battle neuroses and so-called air blast concussion is shown in the accompanying table It will be seen from this table that so-called air blast concussion almost parallels that of battle neurosis whereas the true air blast concussion with real cerebral damage is similar to head injury Some examples of illustrative cases will now be described

### REPORT OF CASES

Case 1.—A pharmacist's mate aged 19 was brought into the hospital by airplane with a diagnosis of air blast concussion which occurred twelve hours before on Okinawa He had been in the front lines administering to the wounded for six days There were deprivation of sleep, inadequate food and water intake and extreme fatigue He had been under heavy artillery and mortar fire most of the time His past history was free of neurotic illnesses or previous breakdowns The last thing he remembered was a shell exploding near him, and he woke up in the evacuation airplane four hours later The neurologic examination was negative There was startle, extreme anxiety, tremor of both hands and a tremulous speech Under pentothal narcosis he relived his battle experience readily, and the following is the summary A mortar blast nearby pushed him on top of a patient to whom he was trying to administer plasma and spoiled the procedure He began to shake at the time violently He dragged his patient into a foxhole and was unable to do any more first aid The patient, he believed by that time, was dead A sense of failure overwhelmed him He heard a terrific explosion above the foxhole, and this was the beginning of the amnesia period Under pentothal he remembered crawling out of the foxhole, screaming and crying, and trying to get up on his feet and run toward the aid station He passed 2 other wounded or possibly dead marines during this struggle Another corpsman aided him and put him into a tank or tractor and took him to the dressing station He remembered being given some sedation, being wrapped in a blanket and put into an ambulance He remembered crying and sobbing during the entire ambulance

13 Penhallow D P Case of a Soldier with Amnesia and Hysteria Boston M & S J 174:131 (Jan 27) 1916

trip to the air field The intense guilt of this man's breakdown occurring at the time when he was thoroughly exhausted would cover the mechanism of the amnesia There is no evidence whatever of damage to his brain, and recovery of the patient took place after three weeks, and he was returned to duty

CASE 2—A marine sergeant, after twelve days in the front lines at Iwo Jima under extremely heavy fighting, was in a trench when a large bomb or torpedo exploded nearby He remembered being covered with black dust and hearing the noise of the explosion An amnesia period lasted for sixteen hours following this Under pentothal he recalled readily that he stayed in the foxhole, afraid to move, with the dust in his nose and mouth He was picked up by a stretcher group and taken back to the beach, which was also under fire On the landing vessel taking him to this ship he opened his eyes to witness the futile efforts of two corpsmen to save a man dying from a horrible wound of the throat in spite of a doctor's attempt to get in a tracheotomy tube The retelling of this part of the episode brought out tremendous agitation, anxiety and hyperventilation The man was much improved after the clearance of his amnesia with rest and sedation and probably was able to go back to noncombat duty after he left the hospital There is certainly no evidence of an organic cerebral lesion here.

CASE 3—A medical officer during an aerial bombardment was walking down the corridor of an LST when a 200 pound bomb exploded in the adjoining passage, spraying an area with fragments 2 feet in front of him He was knocked down and was unconscious for a few minutes He had no recollection of the blast or of the fragments hitting the wall in front of him The last thing he remembered was leaving his cabin to go to his battle station He showed bilaterally ruptured ear drums, loss of hearing, which was partially permanent, bleeding from the nose, moderate bleeding from the lungs, some bleeding from the intestinal tract, bilateral retinal hemorrhages, which cleared up and a definite weak left leg with a Babinski reflex He did not have the startle, tremor and anxiety or other symptoms previously described in the other cases There were a number of red cells in his spinal fluid All these signs except the hearing loss disappeared, and he was able to return to duty three months later This is 1 of the 3 cases in which a true air blast concussion was encountered and occurred in a confined space where air pressure could be built up

CASE 4—A soldier, running across an open space between two hills in the front line, was thrown by a blast of a small mortar shell against a tree, striking his helmet so violently that it produced a large dent in it on the left side. He was dizzy for a minute and had a sharp tingling in his right foot He did not lose consciousness When admitted to the hospital he had a large scalp hematoma, weakness of his right leg, which cleared up in a couple of hours, and persistent left sided headaches which kept him on the sick list for some time and eventually caused his evacuation to the United States This man undoubtedly had a cerebral injury produced by crashing into the tree and not considered as a blast at all

CASE 5—There is a case of reported blast concussion which Lieut Comdr Ira Hardy told me of which an investigation gave the following history A marine sergeant was wounded painfully in the leg but subsequently returned to the firing line on Iwo Jima He was obviously unstrung and stayed in a foxhole, gradually recovering his poise in the bombardment. While standing with his hands on his hip a Japanese 6 inch shell went between his left arm and body, not even cutting his clothes, it failed to explode. The patient uninjured, fell to the ground and had an amnesia for two hours Here we have a pure fright giving all the symptoms with no concussion possible

CASE 6—A second lieutenant marine aged 27, who was brought into the hospital on Guam by air from Iwo Jima, was diagnosed as having blast concussion. When interviewed he stated that he thought the diagnosis was in error and gave the following story He had always been susceptible to seasickness and motion sickness all his life. Outside of that there was no history of any form of nervousness He did well, and there was no trouble until on his transport he was chronically seasick for two and one-half months while the transport was on its way to the invasion He lost 35 pounds (16 Kg) but did not turn in on the sick list. On the landing boat going into the beach he was again violently seasick, and in his mind was the hope of being on firm ground in a few minutes He had no anxiety of the danger of battle. On reaching the beach he stumbled down the ramp and fell on the sand This sensation of being on solid ground and not moving around for the first time in two and one-half months was so delightful that for a moment he lay there enjoying it and then started to get up to join his company At that point two hospital corpsmen grabbed hold of him and put him on a stretcher and carried him back on the boat, which was bouncing on the surf bringing on seasickness Since no physical injury was found, the patient was evacuated by air with the diagnosis of blast concussion, and it was quite obvious that his only complaint was seasickness, so he was returned to his outfit after two weeks' rest and food and continued the remainder of the battle of Iwo Jima without trouble

### CONCLUSION

It is felt that the majority—over 90 per cent of the so-called air blast concussion cases—are extreme hysterical-anxiety states produced in men who have been exhausted or otherwise sensitized to this form of trauma There is no evidence from the observations that I made in these cases of damage to the brain or nervous system A diagnosis of air blast concussion in these cases places the men in a surgical category that is not justified by the facts and deprives them of important prompt psychotherapy It is regetted that no facilities for electroencephalographic recordings were available for this study

## TREATMENT OF HEADACHE WITH INTRAVENOUS SODIUM NICOTINATE

JOSEPH W GOLDZIEHER M D
and
GEORGE L. POPKIN M D
New York

The successful use of oral or parenteral nicotinic acid in the treatment of certain special types of cephalalgia, such as migraine, malarial headache or sinus headache, has been reported within recent years Although these studies were very promising they were of necessity limited in scope For this reason it was decided to investigate the effect of sodium nicotinate on a sufficiently large series of headaches regardless of etiology, and to determine if possible what types are suitable for vasodilator therapy

### MATERIALS AND METHODS

In our experiments sodium nicotinate was used except in a few instances in which niacin was substituted[1] The intravenous route of administration was chosen for precision and the decisiveness of the clinical effect, 100 mg of nicotinic acid or its equivalent as the sodium salt was taken as the standard dose because this amount was found adequate to produce a flush in almost every case One hundred consecutive headaches were treated at City Hospital, Welfare Island, over a period of months, an attempt was made to exclude all neurotic or hypersensitive persons for obvious reasons In 13 additional cases an intravenous injection of nicotinamide (100 mg) was given and some of this group received

From the New York City Hospital Welfare Island Department of Hospitals New York 17

1 The sodium nicotinate (Naotin) used in this investigation was supplied through the courtesy of Mr J H Moss of the Drug Products Company, Inc.

the usual intravenous dose of sodium nicotinate twenty to thirty minutes later. Every attempt was made to minimize psychologic factors; often it was possible to give the injection without the patient being aware of the reason for this procedure. With the appearance of flush and other symptoms a number of routine questions were asked, among them whether there was any amelioration of the headache. Subsequently the patient was questioned as to the nature and duration of the original headache, its cause if determinable, any previous history of cephalalgia, and the effects of the nicotinate therapy in detail. Follow-up at six to twelve hours and again at twenty-four hours was possible in nearly every case.

## FINDINGS

The results of therapy in 100 cases are presented in the table.

The following 2 cases will serve to illustrate the rather dramatic effects of intravenous sodium nicotinate.

## REPORT OF CASES

CASE 1.—A. R. had suffered with typical migraine for a number of years. The characteristic family history, the aura and scotomas were all present. Four consecutive attacks, all

*Results of Treatment in 100 Cases*

| Type or Probable Cause of Headache | Number | Complete Relief | Recurrence: As Before | Recurrence: Moderated | Recurrence: Minimal | Failed |
|---|---|---|---|---|---|---|
| Migraine (typical) | 9 | 8 | 1* | | | |
| Spinal tap | 13 | 11 | | | | |

* See text.

severe, were treated at various intervals after onset with sodium nicotinate intravenously. In each instance there was a prompt flush and with it complete disappearance of the migraine. There was no recurrence. On a fifth occasion this patient had cephalalgia not of the migraine type but presumably due to overwork and weariness. In this instance also an intravenous injection relieved the headache in less than one minute. Subsequent to these injections the patient was given definitive therapy for his migraine with excellent results.

CASE 2.—A young Negro was undergoing diagnostic air encephalography. After 20 cc. of air had been injected into the spinal canal in the usual way a headache developed so severe that the patient refused to cooperate further and threatened to discontinue the procedure by main force. With the patient still in position, 100 mg. of niacin was injected intravenously. The headache disappeared entirely while the needle was still in the vein, and encephalography was completed uneventfully. On the following day the patient awakened with a slight "soreness" of the head but this was of such a mild nature as to require no further medication.

## COMMENT

1. *Reaction to Injection.*—In the average case from thirty to forty-five seconds elapsed before the patient was aware of any effects. Questioning revealed that in the majority of cases a sensation of heat in the genitalia was the first sign noted. Immediately thereafter a throbbing in the vertex or burning of the head and neck with concomitant flushing appeared. Together with the heat there was commonly a feeling of restlessness and oppression, in some females apprehension could be observed for a few moments. As the effect reached its maximum there appeared paresthesias such as itching or pins and needles. Within three or four minutes the patient, though not comfortable, became accustomed to the heat, which gradually subsided in about fifteen minutes and usually disappeared in twenty minutes to a half hour. In 2 cases mild abdominal cramps were observed. In 1 case (with a suspected pathologic condition of the stomach) vomiting occurred, and 1 patient who had migraine vomited forty-five minutes after the injection, whereupon the headache recurred. Considering the time interval it is not certain that the sodium nicotinate was responsible for the vomiting in this instance. By far the greatest number of patients were immensely relieved by the therapy despite its manifest discomforts, and many repeatedly sought the "heat treatment" for subsequent headaches. A minority—invariably those with headaches of lesser severity—objected to the treatment and a few said that the treatment was worse than the headache. Certain patients showed a greater response to the standard dose than did the average individual. On the other hand, some showed little or no response to the injection and in these relief was not obtained. The blood pressure was followed in approximately 30 patients but no significant or consistent changes were noticed and this procedure was discontinued.

2. *Results.*—The individual groups that have been tabulated are in general far too small to permit statistical conclusions. The excellent results obtained in the treatment of migraine both as to rapidity and as to duration of effect require little comment. In every case complete relief was obtained within two minutes, the nature of the single recurrence has been discussed elsewhere. The rarity of side reactions is of interest in comparison to the customary use of ergotamine tartrate in migraine. In the treatment of headache following spinal tap, sodium nicotinate has given better results than the drugs commonly employed. In all 13 cases complete relief was obtained within a few minutes. No recurrence of the headache appeared in any instance. In 2 cases there was minor "soreness" of the head on the following day. In 1 case, for purely experimental purposes, an injection of 100 mg. (not included in the table) was given twenty-four hours after the first injection, with relief of the soreness. Hypertensive patients required larger doses to produce adequate flush, this is most probably coincidental. The results were not as dramatic as usual in 3 of these cases, and in 1 there was a recurrence of moderate intensity. With the presence of organic meningeal involvement (as in syphilitic meningitis) it is not to be expected that a vasodilator would be particularly effective, our findings bear this out. Of the group of idiopathic headaches 74 per cent were completely relieved. There was 1 total failure, in 3 the headache recurred unmodified shortly after treatment, and in 6 more benefit was of short duration.

3. *Controls.*—For purposes of control, injections of 100 mg. of nicotinamide were utilized in 13 cases. One patient with an idiopathic headache stated that he felt somewhat relieved, 2 patients believed that there was possibly some improvement, 10 noted no change. In 5 of this group a second injection of sodium nicotinate

was given subsequently The patient who had experienced some relief from the amide developed a good flush but his headache did not change further The headache of the other 4 patients disappeared completely without recurrence There is no doubt, however, that even with every precaution there is a certain psychogenic factor involved in treating a complaint as subjective as headache with intravenous injections

### SUMMARY AND CONCLUSIONS

1 The effect of intravenous sodium nicotinate was studied in 100 consecutive patients with severe headache Seventy-five were completely relieved

2 The relief of headache appears to be correlated with the degree of peripheral flush

3 Intravenous sodium nicotinate is recommended in the symptomatic treatment of (*a*) severe idiopathic headache, (*b*) migraine and (*c*) postspinal tap cephalalgia

## Clinical Notes, Suggestions and New Instruments

### FRONTAL OSTEOMYELITIS WITH SUBDURAL ABSCESS AND HEMIPLEGIA AFTER FRONTAL SINUSITIS

A A CIRILLO M D
Jamaica, N Y

A case of acute frontal osteomyelitis with subdural abscess was reported as cured by A R. Dingley[1] He concluded that it is uncommon for a subdural abscess to be the sole intracranial complication of an acute frontal osteomyelitis Dr J Lewis Dill[2] reported that one is impressed with the rarity of osteomyelitis of the frontal bone especially after perusal of the recent literature A E Bulson Jr[3] was able to find only 55 cases in a complete review of the literature for the thirty years previous to 1925 Furstenberg[4] found a total of 73 cases of osteomyelitis of the cranial vault up to that date He reported 14 cases which he himself had observed at the University Hospital In this group there were 8 recoveries and 6 deaths Gustave B Fred,[5] in a review of 40 cases of acute fulminating osteomyelitis of the frontal bone occurring in the wards of the Massachusetts Eye and Ear Infirmary during ten years, noted that it complicated acute frontal sinusitis and frequently followed swimming and diving and was marked by profound toxicity Its earliest and most characteristic sign is pitting doughy edema of the forehead The disease is often fatal, usually terminating in brain abscess or meningitis

#### REPORT OF CASE

L L., a woman aged 28, single, admitted to the Mary Immaculate Hospital on May 16, 1945 with the diagnosis of osteomyelitis of the frontal bone ruptured ethmoid and frontal sinus and pansinusitis stated that the illness started with a 'small blind pimple," which she picked The next day she noticed swelling and complained of headache. She treated the eye swelling with warm applications The swelling of the eyes and the face subsided She was up and about and felt well She was seen on May 15 by Dr T J Adams Her temperature was 101 F She complained of a headache and pains over the eyes At this time she was given sulfadiazine 1 Gm every four hours The temperature was up to 103 F the next day She was semicomatose, and a pitting doughy edema of the forehead was noted between the eyes

A history of massive nasal polypi for the past ten years was obtained with recurrence since an operation Polypi filled the entire nasal cavity The patient had poliomyelitis in 1936 but developed no paralysis She had no other illness Her mother and father were living and well

The head showed a pitting doughy edema between the eyes, which was tender and soft The pupils were equal and reacted normally to light The tongue was moist and was coated The nose was filled with numerous polypi, varying in size from a pea to a hickory nut Both nares were involved and some seemed to extend from the ethmoidal region The forehead showed tenderness on pressure over both inner canthi

The heart rate was 100 and regular with good tone No murmurs were present Her chest was clear and resonant except for some fine rales at both bases The abdomen was soft and not tender On May 16 Dr Adams found her comatose stuporous and irrational

On this day I found the patient stuporous, with a temperature of 102 F, pulse rate 88 and respiratory rate 21 My tentative diagnosis was an acute osteomyelitis of the frontal bone and ruptured ethmoid and frontal sinuses in addition to a pansinusitis Immediate surgical intervention was urged An x-ray was taken, and the film showed a pansinusitis with a clouding throughout There was considerable obliteration of the supraorbital ridge on the right side, just below the frontal sinus On the left side there was a similar process but to a lesser degree

Dr D S Cunning saw the patient on May 16 at 5 30 p m and felt that a cavernous sinus thrombosis should be ruled out in view of the history of 'picking a pimple" On the same day a radical frontal Killian bilateral sinusotomy was done by Dr Cunning and myself An incision was made over the supraorbital ridge down to the bone extending over the bridge of the nose to the opposite supraorbital ridge. Both eyes were pushed downward Immediately on retracting the skin we noted an area of necrosis with an opening about the size of a 50 cent piece (30 mm) in the frontal bone over the nasal bridge There exuded free pus throughout Both frontal cavities were filled with polypi and free pus An area of the overlying dura of the brain in the region of both frontal lobe tips was exposed and this showed injection This dura was not disturbed Necrotic bone was thoroughly cleaned away until healthy bone was exposed on both sides The sinus cavities were well cleaned of debris and necrotic bone and the wound was left open Numerous polypi were removed from both nares to favor drainage. Owing to the extensive osteomyelitis it was thought better to permit free drainage consequently no suturing of any kind was attempted Sulfathiazole and sulfanilamide powder were placed in the wound A dressing was applied

A spinal tap done at this time showed the fluid to be clear, under no excessive pressure, with no evidence of cloudiness

Laboratory examination on May 16 revealed that the spinal fluid showed no growth on culture The pus from the bone and sinus showed Staphylococcus albus and a nonhemolytic streptococcus The urine showed no abnormality but the blood showed 3,430 000 red cells, hemoglobin 70 per cent, leukocytes 12 450, 88 per cent polymorphonuclears and 12 per cent lymphocytes

On May 16 20,000 units of penicillin every three hours and 1 000 cc of 5 per cent glucose in isotonic solution of sodium chloride were given slowly intravenously with 75 Gm of sulfadiazine in the form of a 5 per cent solution

When the dressing was changed on May 18 the left arm and left leg showed a hemiplegia Dr Jefferson Browder noted on this day that the patient had had evidence of frontal osteomyelitis for many months, also polypi and pansinusitis for several years The first evidence of intracranial invasion came on May 16, when she became drowsy and later stuporous The frontal sinus opened that night and the patient became more alert the next morning During the afternoon of May 17, weakness of the extremities on the left side was noted Since then the patient had been stuporous but not entirely out of contact with her surroundings She was more drowsy than on the day before but not quite as drowsy as she was on entering the hospital Mild blurring of the nasal border of the nerve head was seen The neck was moderately rigid The abdominal

reflexes were not elicited Paralysis of the left upper and paresis of the left lower extremities were present A bilateral Babinski was demonstrable Deep reflexes were exaggerated on the left side It was three days now since onset of evidence of intracranial invasion, possibly a suppurative encephalitis with cerebral cortical thrombophlebitis The chances for a well

Fig 1—Appearance of patient on June 4 1945 eighteen days after bilateral radical frontal operation twelve days after trephine drainage of subdural abscess and four days after secondary reopening of wound and reestablishment of drainage through previously closed trephine wound

walled off collection of pus were not very good Dr Browder advised caffeine with sodium benzoate 3¾ grains (0 25 Gm) every four hours for six to eight doses, 500 cc of blood, continued chemotherapy and penicillin, with use of the stomach tube, 2 500 cc. of fluids being given every twenty-four hours

After the first dose of caffeine the patient went into a convulsion and the caffeine medication was stopped A suction machine was required beside the patient s bed with oxygen at all times because the mucus would accumulate and embarrass her respiration The patient was still stuporous and the prognosis was obviously grave She became gradually worse and on May 21 Dr Frank Mazzola attending physician in medicine, was also of the opinion that intracranial suppuration existed, and surgical intervention was indicated to rule out a subdural abscess pressing on the motor area and causing the hemiplegia

With this in mind Dr Browder was again called and on May 22 at 9 p m a frontal trephine of the skull was done posterior to the original site, through apparently healthy bone. The scalp and the right frontal region were shaved just above the right eye for an area of about 2 inches A 3 inch vertical incision was made through the scalp, extending down to the skull The scalp was retracted and the bleeding checked. The bone was entered with a Hudson burr, and as the burr went into this area of bone considerable free pus exuded At first it was thought that it came from the dura but this was later noted to be due to an osteomyelitis of the skull When the burr reached the dura, the dura was found red but no bulging was present A rongeur was used to widen the bone opening toward the region of the orbit The dura was opened with a knife. There was an immediate gush of about 12 ounces (350 cc.) of thick creamy pus, a culture of which was taken and found to be sterile Saline solution was used to irrigate the subdural cavity When suction was again applied, more pus appeared The region of the frontal lobe of the brain and the lateral wall and posterior wall of this subdural area was explored There was noted a whitish membrane in this zone of the brain as far as could be visualized The electric cautery was used for the dural edges and the scalp was closed with silk Before so doing 100,000 units of penicillin was injected into this cavity Dr Browder noted that the policy of closing a cavity of this type with penicillin injected into it had been used successfully by him at Kings County Hospital I deferred to Dr Browder's wider experience and injected the penicillin, and the wound was closed

Twenty thousand units of penicillin was given intramuscularly every three hours every day from May 16 in addition to the local injection of 50,000 units of penicillin daily into the dural cavity and the frontal sinuses until May 30 As of this date the patient received a total of 3,575,000 units of penicillin by injection into the subdural space, muscle and subcutaneously

On the morning of May 30 I came to the hospital and dressed the patient's wound and observed that she was obviously very sick I then left for the street. A subconscious thought directed me back to the bedside of the patient I removed the dressing and with a pair of scissors and scalpel and without anesthesia I opened the previously closed trephine wound Immediately there was a discharge of ½ ounce (15 cc) of dark colored blood and pus Massive doses of penicillin were started For example, 200,000 units of penicillin was injected into the buttocks, 100,000 units into the dural cavity and 100,000 units into the sinus cavity

The next day when the wound was dressed the patient showed so much improvement that she was able to speak coherently

Fig 2—Appearance of patient four months after discharge

and the left sided hemiplegia started to improve The massive doses of penicillin were continued until June 12 The dose was then diminished to 40,000 units daily with an injection confined to the local sinus cavity As noted, the patient received 3,575,000 units of penicillin up to May 30 Then the massive dosage was started and continued to June 13 The total amount for the

latter period was 7,260,000 units The dosage was then cut in a gradual fashion so that a total of 600,000 units was administered from June 13 to the time of discharge A total of 11,435,000 units of penicillin was administered to the patient

On June 1 her general condition was very much improved Her temperature was normal, the pulse regular and of good strong quality and her breathing normal From June 2 to June 10 her condition was obviously improving An x-ray revealed no progressive osteomyelitis The bony margins of the operative sites were well defined and sharp, indicating that the osteomyelitis had arrested itself The superior ridge of the left orbit was likewise sharper and more distinct, indicating a similar arrest The dose of penicillin was decreased and on June 27 she was discharged with the final diagnosis of record of an acute frontal osteomyelitis, ruptured ethmoid and frontal sinuses, subdural brain abscess and left sided hemiplegia

The urine showed 3 plus albumin at the height of the infection, and this rapidly diminished to give negative findings

A leukocytosis of 12,450 increased to 16 450 on May 28, confirmed at 17,150 the next day A dramatic drop to 7,400 occurred on the day following the secondary opening of the trephine site on June 2

Dr Browder saw the patient on June 26 and noted that the patient was well oriented, fully cooperative and intellectually seemed normal The midpart of the right frontal surgical scar bulged slightly The scar of the supraorbital region (sinus operation) was healing The right optic nerve head was still blurred but the left had almost completely cleared There was a complete left hemianopsia and also a slight paresis of the left side involving the face and the upper and lower extremities Babinski's sign was not present, nor were the abdominal reflexes altered

On June 26 an examination by Dr W G Frey revealed that the patient was complaining of diplopia, which was diminishing The diplopia was due to a 10 prism diopter degree of right hyperphoria which she overcame quite easily It was his impression that this would gradually diminish

At present the patient has no paralysis and no complaints and the accompanying photographs during convalescence and recovery demonstrate the changing status

### COMMENT

The patient is indeed fortunate if the localizing type of lesion occurs and a diagnosis is established already One of the cardinal signs in the diagnosis is pitting doughy edema of the forehead It is the first and the most reliable sign of osteomyelitis of the frontal bone

Dr Fred divided the 40 cases admitted to the Massachusetts Eye and Ear Infirmary between 1931 and 1941 into two five year groups From 1931 to 1936 there were 12 patients, of whom 6 died, a mortality of 50 per cent From 1936 to 1941 there were 28 patients with 6 deaths a mortality of 21 4 per cent The mortality for the 40 patients was 30 per cent The mortality of 50 per cent in the first five year group was due, Dr Fred feels, to the delayed and inadequate surgery The mortality 21 4 per cent in the latter five year period was due to early radical removal of the entire frontal bone in most of the operative cases Dr Fred noted that all patients with osteomyelitis of the anterior wall of the frontal sinus recovered In Dr Fred's cases only 1 case of subdural abscess as the sole complication of acute frontal osteomyelitis was found.

The subdural localization seems to originate as a result of direct extension from the suppurative osteomyelitis and may be favored by a more pronounced fixation of the dura to the underlying bone.

The involvement of the bone seems to occur by direct extension from the frontal sinus after necrosis of the mucous membrane has taken place The general pathology of osteomyelitis as it occurs in a flat bone seems to apply in its localization in the cortical layers and diploe of the frontal bone.

### CONCLUSION

The inadequacy of chemotherapy and penicillin therapy seems to be borne out by the course this particular case pursued. The importance of adequate surgical measures, to include wide removal of involved bone, and adequate drainage is apparent

89-21 153d Street.

## GASTROSCOPY IN ACUTE AND CHRONIC HEPATITIS

LIEUTENANT COLONEL JOSEPH BANK
*and*
CAPTAIN CHARLES H DIXON
Medical Corps Army of the United States

Recently in THE JOURNAL there appeared a report on gastroscopic observations of patients with infectious hepatitis [1]

During the past two and one-half years we had occasion to employ gastroscopy in the course of diagnostic studies of some cases of chronic hepatitis because of gastric symptoms For comparison, a number of cases of acute hepatitis were examined A total of 43 cases of acute and chronic hepatitis were thus examined by gastroscopy There were 23 cases of acute hepatitis and 20 of chronic hepatitis In no case did gastric symptoms exist prior to the onset of hepatitis X-ray examinations of stomach, duodenum and gallbladder were negative in all

### ACUTE HEPATITIS

The acute cases were diagnosed on the basis of characteristic clinical picture, enlarged and tender liver and jaundice. In the chronic cases there was obtained a history of previous attacks of acute hepatitis with persistent or recurrent symptoms of hepatitis, enlargement and tenderness of the liver and in some cases positive liver function studies Gastroscopies were done at various stages of the disease In the acute hepatitis group of 23 cases there were 18 of the infectious hepatitis type, and 5 followed the administration of blood plasma within three to four months The duration of hepatitis at the time

TABLE 1.—*Duration of Hepatitis in Twenty-Three Acute Cases*

| 1 7 Days | 8-21 Days | 21 30 Days | 2 Mos | 3 Mos | 4 Mos | 5 Mos |
|---|---|---|---|---|---|---|
| 5 | 3 | 10 | 1 | 1 | 1 | 2 |

TABLE 2.—*Duration of Hepatitis in Twenty Chronic Cases*

| 7 Mos | 1 Year | 2 Years | 2½ Years | 3 Years | 7 Years |
|---|---|---|---|---|---|
| 1 | 6 | 5 | 2 | 5 | 1 |

of gastroscopy varied from two days to five months (table 1) Jaundice and elevated serum bilirubin were present in all but 5 of the patients at the time of examination Digestive symptoms, liver enlargement and tenderness were present in all cases The cephalin flocculation was 3 or 4 plus in 14 cases, 2 plus in 5 cases and negative in 4 cases Other liver function studies done at the time of gastroscopy, including hippuric acid, qualitative urobilinogen and albumin-globulin determination, were within normal limits Gastroscopy was within normal limits in all but 2 cases These 2 showed moderate superficial erosions of the body of stomach which were not considered sufficiently significant to account for the patients' symptoms

### CHRONIC HEPATITIS

Gastroscopy was done in 20 cases of chronic hepatitis Thirteen cases followed acute infectious hepatitis, and 7 were postvaccinal The duration since the initial jaundice varied from seven months to three years (table 2) While many of the patients had previous episodes of recurrent jaundice, only 2 had evidence of jaundice at the time of gastroscopy In these 2 the icterus index was in the upper limits of normal Fifteen of the patients had symptoms of hepatitis, and the remaining 5 were not active cases, being under observation only because of enlargement and tenderness of the liver, with a previous history of acute hepatitis The sulfobromophthalein liver function test was abnormal in 6 cases (15 per cent or more retention at thirty minutes with a 5 mg dose) Other liver function studies were within normal limits Four patients showed a mild superficial gastritis in the body of stomach, consisting only of superficial erosions The remainder were entirely normal

### SUMMARY AND CONCLUSIONS

1 Gastroscopy of the gastric mucosa in 43 cases of acute and chronic hepatitis did not reveal significant evidence of gastritis

2 The minimal findings observed in some patients were not considered contributory to the patient s gastrointestinal symptoms

# Council on Pharmacy and Chemistry

*The Council has authorized publication of the following statements* AUSTIN SMITH, M D, *Secretary*

## MEETING OF THE COUNCIL ON PHARMACY AND CHEMISTRY

The Council convened at 10 a m, Dec 15, 1945, at the Palmer House, Dr Sollmann, Chairman, presiding The following members were present Drs David P Barr, S W Clausen, E M K. Geiling, Robert P Herwick, James P Leake, Perrin H Long, G W McCoy, E M Nelson, W W Palmer, Elmer L Sevringhaus, Austin Smith, Torald Sollmann and Isaac Starr

In addition to officers and members of the American Medical Association headquarters staff there were present Dr Milton Veldee, Director, Biologics Division, National Institute of Health Dr Walton Van Winkle Jr of the Food and Drug Administration, Dr Donald A Wallace, Secretary of the Council on Dental Therapeutics, Mr Edward M Burke, attorney at law, Chicago, and Dr Harold C Lueth, formerly A M A liaison officer of the Surgeon General's Office

The following is an abstracted report of some of the more important discussions and actions

*Storage Requirements for Oxophenarsine Hydrochloride and Dichlorophenarsine Hydrochloride*—Dr Veldee reported the findings of the National Institute of Health following tests on and observations of these compounds and asserted that dichlorophenarsine hydrochloride is a stable compound and that oxophenarsine hydrochloride is now more stable because of improved manufacturing technics Following considerable discussion it was agreed that the temperature requirements suggested by the Council (THE JOURNAL, May 5, 1945, p 29) could be dropped in view of the improvements that have been made in the manufacture of these compounds

The general problem of temperature control for the storage of unstable drugs was reviewed It was agreed that for compounds which definitely require refrigeration to ensure stability, and for unstable preparations in need of temperature control, reasonable label statements relating to storage and refrigeration temperature should be required This was adopted as a general policy of the Council

*Acceptance of Drugs for Manufacturing Use*—The Council voted to consider for inclusion in N N R drugs which are made available for manufacturing use It was felt that manufacturers of the basic material should have opportunity to present their products for consideration by a body such as the Council Heretofore the Council has limited its considerations to drugs for wholesale and retail merchandising It was agreed that products which are covered by standards in official compendiums will not be included in this consideration, since standards are already available. Favorable consideration of drugs for manufacturing use by the Council does not permit purchasers of these materials to promote their finished products with claims for or reference to Council acceptance unless the finished items have been examined and also found acceptable by the Council

*Standards for Clinical Thermometers*—There is an urgent need for setting of standards for clinical thermometers many are of poor construction, there is a wide variation in the temperature readings, poor dyes have been used on the markings, misleading statements appear in the promotional material and the name of the manufacturer may be missing In view of the existence of such problems the Council recognizes the need for standards by which all clinical thermometers should be judged to determine whether or not they are satisfactory for clinical use.

The Council moved that a memorandum be sent to the Council on Physical Medicine urging that this body study the problem with a view to setting satisfactory standards for the testing of clinical thermometers Attention was called to the fact that there are also other devices which might be given consideration in the setting up of standards which would provide further uniformity of production and betterment of products The Council on Pharmacy and Chemistry is willing to lend whatever aid it can to the Council on Physical Medicine when it considers the standardization of clinical thermometers.

*Committee on Therapeutic Research*—The Committee's policies were reviewed, and it was agreed that attention should be directed by publication in THE JOURNAL to the Committee's earlier decision (annual meeting, 1945) to make available larger sums of money than have been customary, subject to consideration of the individual request, and to grant an extension of the expiration period of research beyond one year when such action seems indicated With the returning medical men it is anticipated that the number of requests for grants will be appreciably increased

*Report on Thiouracil*—Thiouracil has been subjected to considerable experimental investigation, but concerning its usefulness and toxicity there exists much confusion Following a cooperative survey by the Food and Drug Administration and six manufacturers it was agreed that the drug had a certain field of usefulness and that in spite of certain toxic properties it was suitable for release in interstate commerce. The Council recognizes the urgent need for immediate dissemination of information on this subject. At the last meeting on thiouracil of representatives of industry and of the Food and Drug Administration it was suggested that these two groups make a report to the Council for publication in THE JOURNAL. This report appeared in THE JOURNAL, Feb 9, 1946, page 343

*Therapeutic Trials Committee*—A report was made to the Council on a meeting in New York of members of the Therapeutic Trials Committee and representatives of several Eastern medical schools engaged in medical research The object of the meeting was to provide opportunity for additional clinical investigators to comment on the Committee's objectives and the criteria for operation which it has tentatively adopted It was apparent that many research workers are interested in fundamental or basic research and want freedom to pursue such investigations

*The Metric System*—A report was made to the Council concerning a meeting in Washington of several Council members Dr E Fullerton Cook of the U S P Revision Committee, Drs Justin Powers and Robert Fischelis, respectively editor for and secretary of the American Pharmaceutical Association, and representatives of the Food and Drug Administration This meeting was to discuss the promotion and use of the metric system Agreements concerning equivalents and prominence in print were reached, and soon a joint statement by these bodies will be issued and given widespread circulation and publicity

*Spanish Translation of N N R*—So far there has been little success in providing a Spanish translation of New and Nonofficial Remedies However, several manufacturers have expressed an interest in a cooperative project, and the Council instructed the Secretary to determine the attitude of the Board of Trustees and of industry, in general, of providing ways and means for publishing cooperatively (i e. Council and industry) a Spanish translation

*Therapeutic Conferences*—The Council voted to explore the possibilities of sponsoring conferences on new therapeutic measures, the first to be held at the coming annual meeting of the Congress on Industrial Health (which is sponsored by the Council on Industrial Health) with emphasis being placed on the industrial side From this experience it can be determined whether further conferences, symposiums or congresses should be held and under what circumstances A number of educational leaders have stated that there is a real need for such Council activity and that if it is properly arranged it will be continuously successful A committee was appointed by the Chairman to assist the Secretary in this matter

*Revision of Council Rules*—Much of the time of the meeting was devoted to detailed consideration of the Council's rules, with a view to necessary and desirable revisions A comprehensive revision was arrived at, will be published in THE JOURNAL and will be made available in booklet form.

# MEDICAL LICENSURE STATISTICS FOR 1945

## FORTY-FOURTH ANNUAL PRESENTATION OF LICENSURE STATISTICS BY THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS OF THE AMERICAN MEDICAL ASSOCIATION

Victor Johnson, M D, Secretary, and Anne Tipner

| Graduates of Unapproved Schools Registered 1940 1945 | 127 |
| Graduates of Schools of Osteopathy Registered by Medical Examining Boards 1940 1945 | 127 |
| Physicians Examined on the Basis of Credentials Obtained in Countries Other Than the United States and Canada | 130 |
| Officers of State Boards of Medical Examiners | 132 |
| BOARDS OF EXAMINERS IN THE BASIC SCIENCES | 132 |
| NATIONAL BOARD OF MEDICAL EXAMINERS | 135 |
| EXAMINING BOARDS IN THE MEDICAL SPECIALTIES | 137 |

This forty-fourth annual compilation of medical licensure and allied statistics by the Council on Medical Education and Hospitals covers the calendar year 1945 and includes data regarding (*a*) medical examining and licensing boards of the United States, the District of Columbia, the territories and possessions of the United States, (*b*) boards of examiners in the basic sciences, (*c*) the National Board of Medical Examiners and (*d*) examining boards in the medical specialties

The official reports which form the basis for these compilations have been contributed throughout the year by the medical licensing boards of all the states, Alaska, Hawaii, Puerto Rico and the Virgin Islands, the eighteen boards of examiners in the basic sciences, the fifteen approved examining boards in the medical specialties, the National Board of Medical Examiners, and the homeopathic medical licensing boards of Connecticut, Delaware and Maryland The homeopathic and eclectic examining boards in Arkansas and the homeopathic board in Louisiana did *not* examine or license any one during the year No physicians were registered for civilian practice in the Canal Zone

The cooperation of the officers of the foregoing boards in making possible the vast amount of reliable information presented in the following pages has been invaluable The Council and THE JOURNAL express their appreciation to those who have supplied these data and for other records furnished throughout the year to the office of the Council

The tables referring to medical licensing boards include figures for the number of candidates examined for medical licensure in 1945, the numbers licensed and those who have secured their first medical license and therefore represent additions to the medical profession The state boards are discussed first, followed by the basic science boards, the National Board of Medical Examiners and the examining boards in the medical specialties

### STATE BOARDS OF MEDICAL EXAMINERS

#### LICENSES ISSUED

During the year 1945 there were 9,153 licenses to practice medicine and surgery issued by the medical examining boards of the forty-eight states, the District of Columbia, Alaska, Hawaii, Puerto Rico and the Virgin Islands, as shown in table 1 Of these licenses 5,541 were issued after examination and 3,612 by reciprocity and endorsement of other state licenses or of the certificate of the National Board of Medical Examiners

TABLE 1.—*Licenses Issued 1945*

| | On the Basis of | | |

P—Passed F—Failed

It does not follow that all physicians certified in a given year after examination were tested in that year In twenty-three states, the District of Columbia, Alaska, the Canal Zone, Hawaii and Puerto Rico the internship is a requisite for practice, but in some of them a physician is permitted to take an examination before completion of the internship, if the examination is successful, the license is withheld until completion of the internship Licenses are also withheld in some states for proof of citizenship and other technicalities In other instances the licenses of those examined in December are dated and issued in the following year The statistics in table 1, therefore, include many who were examined in 1944 and even a few in previous years Consequently, figures in this table will not entirely correspond with those of later tables which deal with physicians examined for medical licensure

The greatest number of licenses during the calendar year 1945 were issued in California, 1,208 Two other states licensed more than 500 New York 799 and Pennsylvania 518 Twenty states, the District of Columbia and the territories and possessions licensed fewer than 100 The smallest number (6) was granted in Wyoming None were licensed by examination in New Mexico and Wyoming, and only 1 physician was registered by this method in Nevada Twenty-one boards (notably California, Connecticut, the District of Columbia, New Jersey and New York) licensed more physicians by reciprocity or endorsement than by examination Florida, Idaho, Massachusetts, Rhode Island and Hawaii have no reciprocal agreements, but with the exception of Florida these states endorse diplomates of the National Board of Medical Examiners

Increases in the number of physicians registered last year as compared with data reported for the year 1944 [1] were noticeable in a number of states and particularly in Arkansas, California, the District of Columbia, Florida, Illinois, Indiana, Iowa, New Jersey and the possessions, while more pronounced decreases in registration occurred in Georgia, Kansas, Kentucky, Maryland, Michigan, Mississippi, Missouri, Nebraska, Ohio,

TABLE 3—*Licenses Issued, 1935-1945*

| | Examination | Reciprocity and Endorsement | Total |
|---|---|---|---|
| 1935 | 5,725 | 2 194 | 7,919 |
| 1936 | 6,275 | 2 772 | 9 047 |
| 1937 | 6 629 | 3 201 | 9,83[illegible] |
| 1938 | 6 557 | 2 9[illegible]6 | 9,51[illegible] |
| 1939 | 6 400 | 2 872 | 9 272 |
| 1940 | 6 289 | 2 866 | 9,15[illegible] |
| 1941 | 6 054 | 2 759 | 8,81[illegible] |
| 1942 | 6 141 | 2 469 | 8 610 |
| 1943 | 6 057 | 2 336 | 8,393 |
| 1944 | 7 058 | 2,589 | 9 647 |
| 1945 | 5 541 | 3 612 | 9 153 |
| Totals | 68 790 | [illegible] 629 | [illegible] |

Pennsylvania and Virginia The decreases in these states were most noticeable in the examination column

Totals for ten previous years by all methods of licensure are shown for comparison in table 3 The high figures for the years from 1936 to 1941 in the annual number of licenses issued were due to the licensure of foreign graduates In 1944 there was an increase of 1,254 over the number registered in the previous year, while in 1945 there were 494 fewer

than in 1944 Acceleration started in most medical schools in the United States about July 1, 1942 and the peak of graduates was reached in 1944, when two classes were graduated at most schools The total graduates for the four session three year cycle to July 1 1945 was 20,662 For the four years 1942 to 1945 inclusive 35,803 physicians received licenses This figure includes physicians previously licensed who are migrating to other states and veteran medical officers not returning to their original state of practice It is believed that the great majority of recent graduates will have been licensed prior to entry on active duty with the armed forces Discontinuance of the A S T and Navy V-12 programs in medical schools at the end of the session which for most schools ended in March 1946 permits schools to decelerate, and most if not all schools are planning to discontinue the accelerated program

In the eleven years shown in table 3 there were 99,355 licenses issued, 68,726 after examination and 30,629 by endorsement of credentials The figures given do not altogether represent individuals but include persons who may have been licensed in more than one state during a given year nor does the total represent additions to the medical profession, since a physician previously licensed in one state may be licensed by examination in a nonreciprocating state Among those licensed by reciprocity or endorsement are some who received licenses by endorsement of the certificate of the National Board of Medical Examiners but may not have been previously licensed In tables 11, 12 and 13 can be noted the number who secured licenses for the first time and therefore represent additions to the medical profession in the United States and its territories and possessions

## CANDIDATES EXAMINED BY MEDICAL EXAMINING BOARDS

Compilations referring to those examined for medical licensure in 1945 by individual states, the District of Columbia, Hawaii and Puerto Rico, indicating the numbers who passed and failed in each state and the medical school of graduation, are recorded in table 2 Medical schools in the United States and Canada which are no longer in existence, foreign faculties of medicine and unapproved schools are not listed by name, but the numbers examined in each state in these three categories are indicated at the bottom of the table In the past year 5,929 were examined, of whom 5,341 passed and 588 failed Candidates represented sixty-nine approved medical schools in the United States, nine approved medical schools of Canada, seventy-five faculties of medicine and three licensing corporations of other countries, six medical schools now extinct, five unapproved institutions, six colleges of osteopathy and 1 individual who had not completed the medical course Osteopaths who were granted the privilege to practice medicine, surgery or both by the medical examining boards are included in these statistics Osteopaths who obtain the legal right to special practice by the osteopathic board are excluded from these compilations

Examination schedules have been adjusted to coincide as nearly as possible with the graduating dates of the medical schools located within the various states

Executive officers and members of examining boards are to be commended for adding this work to their already overtaxed responsibilities

The 5,929 examinees represented 4,928 graduates of approved medical schools in the United States, of whom 2 5 per cent failed, 53 graduates of approved Canadian schools, 15 1 per cent of whom failed, 25 who graduated from approved medical schools no longer operating, with 24 0 per cent failures, 475 graduates of faculties of medicine located in countries other than the United States and Canada, 56 0 per cent of whom failed, and

TABLE 4.—*Graduates of Medical Schools in Canada Examined for Licensure in the United States, 1945*

| Totals | 53 | 45 | 8 |

448 graduates of unapproved schools with 40 8 per cent failures The numbers examined in these categories depart significantly from the figures for the year 1944 The number from approved schools in 1945, while considerably lower than in 1944, is in excess of the normal number of annual examinees but cannot be compared with 1944, owing primarily to the accelerated program Figures for the latter year represent two graduating classes in many instances, namely December 1943 and September 1944 There were considerable reductions among foreign graduates and graduates of unapproved schools New York, where the greatest number of foreign graduates are tested, examined 190 fewer than in 1944 The majority of physicians

TABLE 5.—*Source of Candidates Examined for Licensure in the United States 1945*

| Medical Schools | Number of Schools | Number Examined | Number Passed | Number Failed | Per centage Failed |
|---|---|---|---|---|---|
| Approved in United States | 69 | 4 928 | 4,503 | 125 | 2.5 |

| Extinct | 6 | 25 | 19 | 6 | 24 0 |
| Foreign | 78 | 475 | 209 | 266 | 56 0 |
| Unapproved schools | 14 | 448 | 265 | 183 | 40 8 |
| Totals | 176 | 5 929 | 5,341 | 588 | 9.9 |

recorded in the classification of extinct medical schools were graduates of Rush Medical College In 1945 there were fewer graduates of this school examined than in 1944 There were also 134 fewer graduates of unapproved institutions examined Massachusetts, where the examining board was compelled by law to examine such graduates, last year examined 122 fewer than the previous year The state approving authority in Massachusetts, created some years ago, has ruled that only those graduates who matriculated in medical schools not acceptable to that body prior to Jan 1, 1941 will be eligible for licensure examinations in the future

As in table 1, the 5,929 physicians and others examined for medical licensure do not represent an equal number of individuals, since a candidate might take an examination in more than one state and is counted in each state However, if a candidate fails more than once in a given state within the year he is counted in that state as only one failure

The greatest number of graduates of any one school examined was 228, representing Indiana University School of Medicine, 213 of whom were examined in Indiana and 15 in seven other states This figure includes two graduating classes (December 1944 and August 1945) Only 1 of these 228 examinees failed More than 150 graduates of four other schools applied for licenses by examination last year, namely Northwestern University 158, St Louis University 158, Jefferson Medical College 160 and the University of Tennessee 158

Twenty-seven approved schools in the United States had no failures before medical licensing boards, 28 less than 5 per cent and 5 between 5 and 10 per cent There were nine schools with 10 per cent or more failures in state examinations Failures from all schools in this country amounted to 2 5 per cent The percentages for failures are modified by data on those who were examined by the National Board of Medical Examiners in its final examination as well as those passing state tests (see table 6)

Graduates of the University of Pennsylvania were examined in the greatest number of states—twenty-two Northwestern alumni were tested in twenty-one states, Harvard Medical School and Temple University in twenty states All other schools had their graduates examined in fewer than twenty states Fourteen schools had graduates examined in fewer than five states Only 1 graduate of Albany took a state written examination, this occurred in Pennsylvania

Two of the five homeopathic boards in existence examined 3 candidates Delaware 1 and Maryland 2 The homeopathic boards in Arkansas, Connecticut and Louisiana did not examine any one in 1945 The one eclectic board in Arkansas likewise did not examine a candidate

Fifty-three graduates of the nine approved medical schools in Canada were tested for medical licensure in the United States in 1945 in eighteen states (table 4), of whom 45 passed and 8 failed Nearly half of these were examined in New York, with 15, and California, with 10 Normally, large numbers of the graduates of McGill University and the University of Toronto seek licensure in the United States However, during the war years the migration of these graduates decreased In 1945 there were 23 graduates of McGill examined in thirteen states and 7 from Toronto who appeared for licensure in four states The highest percentage of failures was 66 7, however, this was from only 6 graduates of Laval University examined in three states Four Canadian schools had no failures before United States licensing boards, while four other schools had percentages higher than 14 The one remaining school had 4 4 failures

Graduates of osteopathic schools were examined by the medical boards of eight states, namely Colorado, Connecticut, Massachusetts, Nebraska, New Jersey, Ohio, Texas and Wisconsin, while graduates of unapproved schools were examined in Illinois, Massachusetts and Virginia Included among unapproved graduates is 1 candidate who had not completed his

medical course He failed in New Jersey There were 448 graduates of unapproved and osteopathic schools of whom 265 passed and 183, or 40 8 per cent, failed The numbers of successful candidates in these two categories can be ascertained by reference to tables 23 and 24 page 126

Graduates of medical schools of other countries were examined in twenty-five states, the District of Columbia and Puerto Rico There were 475 such graduates, with 266 (56 per cent) failures

Twenty-five graduates of medical schools no longer in operation were tested in eleven states, of whom 19 passed and 6 (24 per cent) failed

Altogether there were 5,929 candidates who appeared before medical examining boards in 1945 of whom 5,341 passed and 588 or 9 9 per cent, failed

The source of candidates for licensure last year on the basis of examination is further tabulated in table 5 giving totals for five groups, namely approved medical schools in the United States and those in Canada schools no longer in existence, foreign faculties of medicine and unapproved institutions As previously mentioned, 2 5 per cent from the United States schools failed, as did 15 1 per cent of the graduates of Canadian schools The greatest percentage of failures represented two groups, foreign and unapproved schools In these two categories 56 and 40 8 per cent respectively failed Of extinct schools 15 1 per cent failed

Figures which indicate actual licentiates and represent additions to the medical profession in 1945 are given later in tables 11, 12 and 13

### CONSOLIDATED EXAMINATIONS

A more accurate picture of the performance of graduates in licensure examinations than the foregoing is given by the figures which combine the results of state medical board examinations with those of part III of the National Board examinations (table 6) In 1945 there were 4,928 graduates of approved medical schools in the United States examined by medical licensing boards, of whom 2 5 per cent failed In the same period 1,219 graduates of these institutions appeared for part III of the examination of the National Board of Medical Examiners, of whom 2 4 per cent failed In some instances schools having a high percentage of failures before licensing boards had few, if any, failures before the National Board of Medical Examiners In these consolidated figures for 6,147 graduates the percentage of failures of approved medical schools in the United States was reduced to 2 2

Of the Canadian graduates 15 1 per cent failed state board tests and 13 1 the combined tests Little comparison is possible in this group, since only 8 graduates of three Canadian schools were examined by the National Board

Only 3 graduates of foreign medical faculties were admitted to the National Board's final examination, while 475 were examined by state licensing boards The National Board does not admit to its examinations the graduates of unapproved medical schools in the United States, and from foreign schools it admits only the graduates of the university medical schools of Great Britain and Ireland provided these graduates have been licensed to practice in the country in which the school attended is located

The total of all examined before medical licensing boards was 5,929, of whom 5,341 passed and 588, 9 9 per cent, failed For both groups—state boards and the National Board—7,160 were examined, 6 559 passed

and 601, or 8.4 per cent, failed. Fifty-nine existing schools and one extinct approved medical school were represented in the National Board's examinations. Seventeen of these schools had graduates examined in each group, with no failures in either. Three schools had failures of 10 per cent or more in the combined statistics. Loyola 11.1, Hahnemann 10.2 and Woman's Medical College 10.0.

FAILURES

Failure before medical licensing boards by licentiates of 1945 are recorded in table 7. In presenting these statistics the United States is divided into two groups—the thirty states and the District of Columbia in which approved four year medical schools are located and those states and territories and possessions which have no medical school within their boundaries. Included is the number who failed state board examinations and were graduates of a medical school located in the state in which they were examined and, for comparison, the number of graduates licensed in a given state who obtained their professional training in schools in other states.

Practically all states require the applicant to receive a general average of 75 per cent and 50 per cent in any one subject. In case of failure in not more than two subjects the applicant is entitled to another examination in those subjects within twelve months. A few states consider such individuals as conditioned in the subjects in which they fail and do not report them to the office of the Council on Medical Education and Hospitals as failures. In these instances they are not considered in the calculations in this study. When their grades are raised after a successful test in the subjects in which they failed they are recorded among those who passed.

Thirty-seven physicians failed examinations in the state in which they obtained their professional training. This occurred in seven states. Twenty-four states had no failures from approved schools within their boundaries. On the other hand, ten states reported 53 failures who graduated from approved medical schools located in states other than the one in which they were examined. Of particular interest in analyzing this table was the fact that the three approved medical schools in Massachusetts had no failures before the licensing board of that state while 11 per cent of the graduates of thirty approved schools in other states failed. In New York 6.6 per cent of those who studied medicine in eight of the nine medical schools located in that state who appeared for licensure in 1945 failed and 17.8 per cent who obtained their training in thirty-four schools located in other states failed.

In eighteen states having no medical schools only two reported failures, Florida and Nevada, 33 and 1 respectively. Fifty-three schools were represented at Florida examinations, with 14.9 per cent failures.

The total examined in the first group—states in which approved four year medical schools are located—was 4,426, while in the second group—states which have no approved medical school within their boundaries—502 were examined.

In another table presented in this group (table 8) the data are further subdivided by the number of candidates who were licensed after previous failure. The figures are presented for three categories—approved medical schools in the United States and Canada, foreign faculties of medicine and unapproved institutions. These groups are classified according to the number licensed after failing a state board examination once and after two or more failures and indicates whether the single and multiple failures have been in the state where licensed or elsewhere. The total number of candidates in 1945 examined and licensed or granted licenses by reciprocity or endorsement of credentials is shown as well as the total number of failures in all groups.

In 1945 there were 9,153 individuals licensed to practice medicine. Of these 381 had previously been unsuccessful before a licensing board. From the approved schools 170 of those licensed had previously failed a state board examination. Sixty-nine had one failure before being licensed in a given state, and sixty-two were licensed after one failure in another state. Thirty-nine received licenses after more than one failure, 16 of whom were registered in the original state, 19 elsewhere and 4 failed in the state where licensed and elsewhere.

One hundred and sixty-seven graduates of foreign faculties of medicine and 44 graduates of unapproved institutions were licensed after previous failure. The multiple failures shown for these two groups reveals the difficulty these individuals experience in passing licensure tests. In the computation of these statistics the

records indicated that 39 graduates of foreign faculties of medicine, 8 graduates of unapproved institutions and 6 from approved schools failed five or more times before licensure. Of the foreign graduates 14 had five failures before obtaining a license, 7 failed six examinations, 5 failed seven, 4 eight, 3 nine, 1 each ten, eleven and twelve, 2 thirteen and 1 failed fifteen tests.

The 8 graduates of unapproved institutions failed as follows: five tests, 2, six tests, 3, seven tests, 1, and 1 graduate failed twenty-one tests and another thirty tests, all in Massachusetts, before securing licensure in that state. The majority of these physicians with multiple failures were Massachusetts and New York examinees.

In sixteen states all physicians licensed last year had no failure in a state medical examination before being registered. With the exception of California, Connecticut, the District of Columbia, Illinois, Massachusetts, New Jersey, New York, Ohio and Pennsylvania, the number of physicians licensed throughout the country in each state after previously having failed was less than 10.

## REGISTRATION BY RECIPROCITY AND ENDORSEMENT

The reciprocity and endorsement policies in effect in the United States, Alaska, Hawaii and Puerto Rico are summarized in table 9. Four states, Florida, Idaho, Massachusetts and Rhode Island, as well as Hawaii, have not established reciprocal agreements with regard to medical licensure. With the exception of Florida, these states and Hawaii will register diplomates of the National Board of Medical Examiners. Those desiring licenses by reciprocity or endorsement in sixteen states and the District of Columbia are required to obtain a certificate from the state board of examiners in the basic sciences before being eligible for medical licensure in the given state.

*Some kind of reciprocal relationship* in medical licensure has been established in forty-four states, the District of Columbia, Alaska and Puerto Rico. Twenty-six of these states, Alaska and Puerto Rico have definite reciprocal agreements with specific states. Twenty-six states, including seven which have specific reciprocity agreements, are given discretionary powers under the medical practice act. These twenty-six states will regis-

This summary should be supplemented by direct communication with the

Some states have additional requirements for graduates of schools outside the United States and Canada

+ indicates reciprocal or endorsement relationships have been established indicates no reciprocal or endorsement relationships have been established (See column— At the discretion of the board )

1 1st P first papers required ⊕ in citizenship column indicates full citizenship required

2 In most cases there is a small additional recording or registration fee

3 If state of original license grants similar privileges

4 Internship accepted in lieu of one year's practice

5 Professional practice required

6 All applicants must be graduates of a medical school approved by the American Medical Association

7 Just preceding application

8 No basic science reciprocity—examination must be within the state

9 Basic science certificate required either by reciprocity or examination in addition to basic science subjects of National Board

10 Canadian citizens are required to file first papers

11 Leading medical schools of Great Britain recognized

12 Oral examination required when original license is ten or more years old

13 Applicant must have resided in the state used as basis of application for one year after date on said certificate

14 Oral examination required

15 Unless in practice in another state for five years

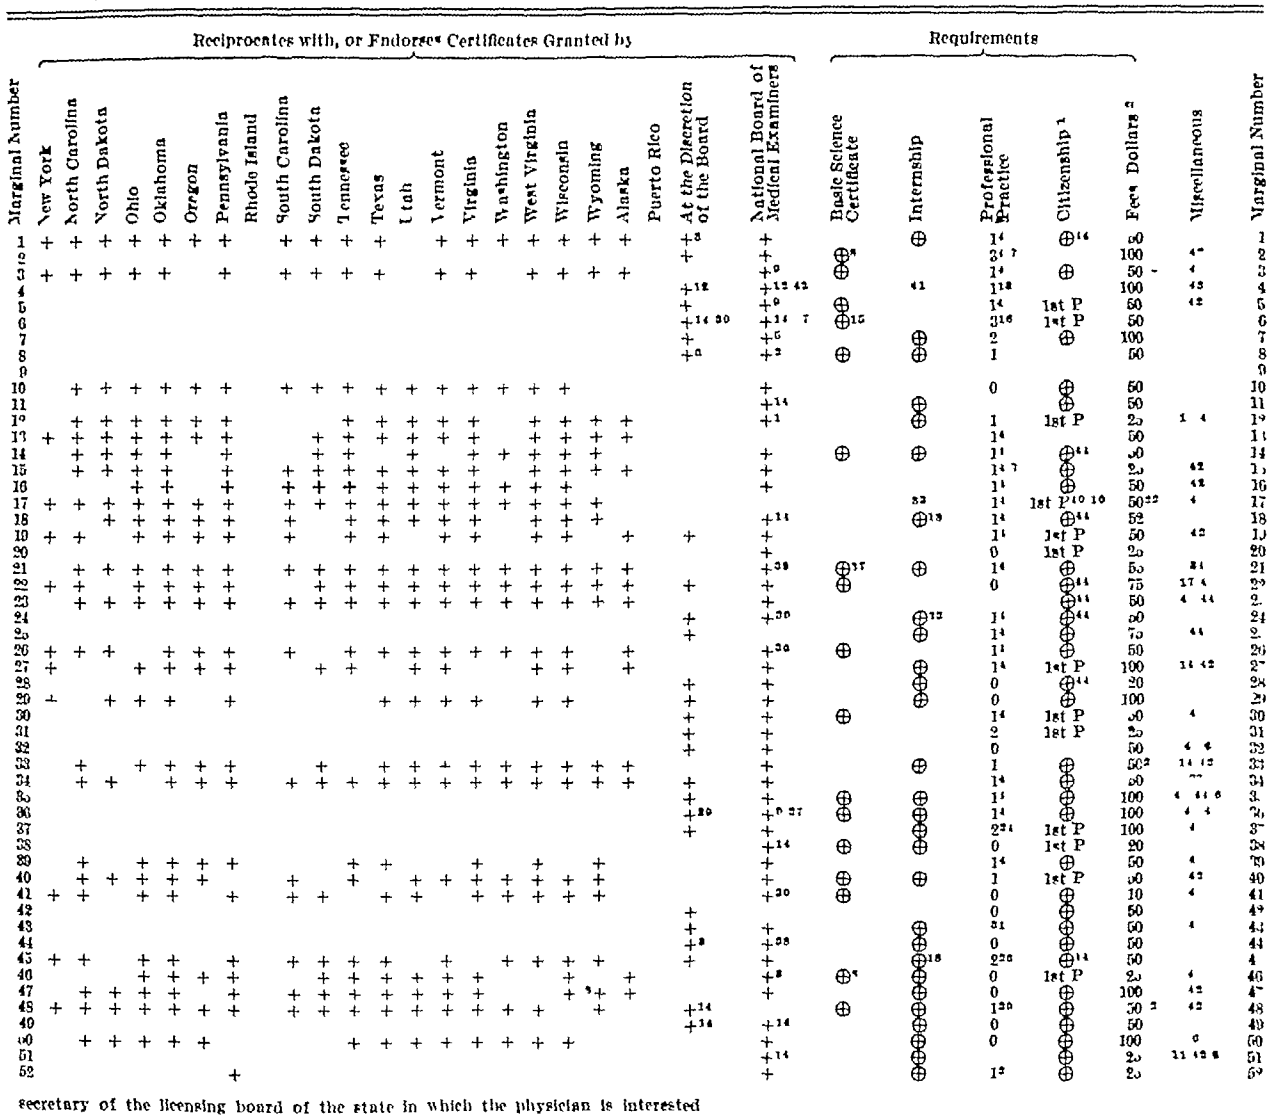
16 Actual practice for a period of three years immediately preceding date of application

17 Practical clinical examination required

18 Foreign graduates only

19 Regular and Homeopathic boards

Specific requirements, such as professional practice, oral examination and internship, are recorded, as is also the fee for a license without written examination Citizenship prerequisites are mentioned In some states physicians of Canadian birth are exempt from the citizenship requirement This is indicated in footnotes Few states will accept graduates of foreign faculties merely general statements of licensure policies A physician using this chart for reciprocity purposes should supplement the information contained therein by direct communication with the secretary of the licensing board of the state in which he is interested



The credentials presented by physicians granted licenses to practice medicine and surgery without writ-

ten examination are given in table 10 There were 3 612 so registered on the basis of licenses previously issued by other states, the District of Columbia, the territories or possessions or foreign countries, the certificate of the National Board of Medical Examiners or one of the government services

the same type of credentials were the 1,103 presenting certificates of the National Board of Medical Examiners On the basis of the National Board's certificate 407 were certified by New York and 143 by Massachusetts

More than 100 physicians presented licenses issued in Illinois, Maryland, Michigan, Missouri, New York,

*Policies of State Medical Boards*

secretary of the licensing board of the state in which the physician is interested

20 Licentiates of Florida Idaho Massachusetts Rhode Island and Hawaii not eligible for license by reciprocity
21 Regular board
22 Fee same as applicant's state charges if more than $50
23 Oral examination required if applicant's state requires it
24 If the applicant passes the examination in the state from which he transfers after the completion of his internship, no practice is required
25 Two year residency accepted in lieu of one year's practice
26 Internship accepted—considered equivalent to two years practice
27 Fee $25
28 Conditionally
29 A two year internship is accepted
30 Diplomates of National Board not required to have been in practice for three years
31 Same as required of Utah candidates applying for licensure
32 Clinical examination required.
33 Reciprocity applicants only
34 Supplemental examination required in certain cases when accepting the examination of a state with whom reciprocal relations have not been established
35 May be licensed after a special (written) supplemental examination
36 Fee for license on basis of National Board certificate $50
37 For matriculants after Oct 15 1937
38 Fee $20
39 Fee $15
40 Permanent license withheld until completion of citizenship
41 Graduates of foreign medical schools effective Sept 15 1935 Canadian schools exempted effective Sept 10 1939
42 Graduates of foreign medical school are not accepted
43 Graduates of foreign medical schools must have fulfilled all requirements of California prior to admittance to examination for any certificate used as basis of application to California
44 Not applicable to citizens of Canada

California issued 708 licenses by this method, New York 512 and New Jersey 236 Seven other states endorsed 100 or more candidates, namely the District of Columbia 177, Michigan 160, Texas 145 Massachusetts 143 Ohio 127, Connecticut 105 and Maryland 101 The largest numbers of candidates presenting Ohio, Pennsylvania and Tennessee The greatest number (298) were licensed on the basis of previous registration in New York Other states registered 69 physicians holding California licenses, while that state licensed on credentials 708 physicians from other states Similarly other states licensed 37 physicians from New

Jersey, while that state endorsed credentials of 236 from outside the state On the other hand Illinois endorsed only 64 credentials from other sources, while other states accepted 224 candidates previously licensed in Illinois No physician holding a New Hampshire certificate applied for registration in another state during the year, and only 1 physician from Nevada and Wyoming sought licensure elsewhere Florida, with no reciprocity or endorsement policies, licensed no one except by the regular examination procedures

Eight were admitted to private practice in the Virgin Islands on presentation of satisfactory credentials Twenty-six medical officers of one of the government services received licenses without written examination in seven states California 11, Texas 4, Wisconsin 4, Illinois 3, Virginia 2, Kentucky 1 and Utah 1

Five physicians who were legal residents of Pennsylvania and were qualified to take the state board examination but were prevented from doing so by their service in the armed forces were licensed without examination in Pennsylvania under the provisions of Act No 132, approved April 25, 1945

Two physicians were licensed in the District of Columbia and 1 each in California and New York on credentials from one of the possessions of the United States The foreign credentials of 8 physicians were accepted as a basis for licensure without examination Arizona (Canadian license), Delaware (England), New York (Canada, Manitoba, Austria, France and Germany) and Vermont (Quebec)

Included in the table are 35 osteopaths licensed without examination These individuals secured licenses in the District of Columbia, Indiana, Ohio, Oregon, Texas and Wisconsin

Diplomates of the National Board of Medical Examiners were registered on the basis of this credential by forty licensing boards in the United States and by the boards of Hawaii and Puerto Rico last year There were 1,103 individuals who presented these credentials Of all who were registered by reciprocity and endorsement nearly one third presented National Board credentials

The number of physicians securing licenses by reciprocity or by endorsement has been steadily increasing in recent years The figure for 1945 (3,612) represented 1,023 more licenses issued by this method than in 1944

## LICENTIATES REPRESENTING ADDITIONS TO THE MEDICAL PROFESSION

Licentiates of 1945 who received their first license to practice medicine and surgery during the year and therefore represent additions to the physician population of the United States, Alaska, Hawaii, Puerto Rico and the Virgin Islands are recorded in table 11 The figures in this compilation represent candidates examined in 1945 and immediately licensed, also those examined in previous years whose licenses were withheld for lack of internship, citizenship and other technicalities and issued in 1945, and those without a state license who were during the year certified on the basis of the examinations of the National Board of Medical Examiners, government services or Canadian and foreign credentials The majority licensed by examination represent recent graduates who received their training under the A S T or Navy V-12 programs and will enter active duty with the Armed forces on completion of an internship Therefore only a small percentage of the 1945 licentiates who received licenses after examination can be considered to be additions to the present civilian physician population

There were 5,707 additions to the medical profession in 1945 The number removed by death in the United States, possessions and temporary foreign in the same period was 3,815 [2] It would appear therefore that the physician population in the United States last year was increased by 1,892 There was a decrease of 1,252 new licentiates as compared with the previous year's figure of 6,959, but the 1945 figure corresponds to the annual prewar excess of physicians added to

the profession over deaths While a decrease in the civilian physician population had resulted because of the active military service obligation of recent graduates there has been an increase in the number of physicians licensed without examination, as seen in table 1 as a result of the veteran medical officers returning to civilian practice

The greatest number of physicians in any one state, 616, was added to the profession in New York Both California and Pennsylvania added more than 400 and Illinois and Ohio more than 300 By comparison with 1944 figures [1] it can be noted that more were licensed and represent additions to the profession in 1945 in the cases of Alabama, Arkansas, California, Connecticut, District of Columbia, Florida, Illinois, Indiana, Iowa, North Carolina, Tennessee, Texas, Utah, Ver-

2 J A M A 130 148 (Jan 19) 1946

mont, Wisconsin and the territories and possessions The comparison of figures with 1944 showing increases in a number of states is significant since figures for the previous year represented two graduating classes in many instances Indiana University was the only school that had two classes examined in 1945 No one was added to the profession as a first licentiate in New Mexico, North Dakota and Wyoming, while in thirteen states between 100 and 299 received initial licenses Twenty-seven states, the District of Columbia, Alaska, Hawaii, Puerto Rico and the Virgin Islands added fewer than 100 The 5,707 licentiates constituting additions to the medical profession last year represented 4,939 who secured their licenses by examination and 768 by endorsement of credentials The latter represent mainly diplomates of the National Board of Medical Examiners

| Totals | 4 939 | 768 | 5 707 |

Table 13 in this section gives the number of licentiates added to the profession each year since 1935 Twenty-seven states, the District of Columbia, Alaska, Hawaii, Puerto Rico and the Virgin Islands added fewer than 100 The 5,707 licentiates constituting additions to the medical profession last year represented 4,939 who secured their licenses by examination and 768 by endorsement of credentials The latter represent mainly diplomates of the National Board of Medical Examiners

Increases in the physician population arranged in nine geographic divisions are shown in table 12 The Middle Atlantic and East North Central group of states added the greatest number, 1,165 and 1,192 respectively More than 600 were added in three groups—the West North Central, South Atlantic and West South Central states The fewest number of physicians, 105, were added to the medical profession in the Mountain states Two states in this group—New Mexico and Wyoming—did not add a single physician to the medical profession last year in this compilation of first licenses

In eleven years there were 66,646 physicians added to the profession (table 13), 61,041 were licensed after a successful written examination and 5,605 by reciprocity or endorsement In the same period 99,355 licenses were issued, 68,726 by examination and 30,629 by endorsement of credentials Thus 32,709 licenses were obtained in this eleven year period by physicians who had previously been licensed to practice medicine

TABLE 13—*Licentiates Representing Additions to the Medical Profession, 1935 1945*

| Year | Examination | Reciprocity and Endorsement | Total |
|---|---|---|---|
| 1935 | 5 099 | 411 | 5,510 |
| 1936 | 5,548 | 629 | 6,177 |
| 1937 | 5,812 | 612 | 6 424 |
| 1938 | 5 759 | 501 | 6,260 |
| 1939 | 5 584 | 460 | 6 044 |
| 1940 | 5 432 | 455 | 5,887 |
| 1941 | 5,239 | 473 | 5 712 |
| 1942 | 5,558 | 454 | 6 012 |
| 1943 | 5,582 | 372 | 5,954 |
| 1944 | 6 480 | 470 | 6 950 |
| 1945 | 4,939 | 768 | 5 707 |
| Totals | 61 041 | 5 605 | 66 646 |

Estimated figures indicate that on Jan 1, 1946 the number of physicians in continental United States including those licensed in 1945 and those still in military service was 195,899 With the rapid discharge of medical officers in the past nine months it can be assumed that the civilian physician population will reach its prewar level within a reasonable period

### LICENSURE UNDER THE ACCELERATED PROGRAM

The majority of physicians who obtained their professional training under the wartime accelerated program have thus far experienced no difficulty in obtaining licensure on that account All states, as well as the District of Columbia, Alaska, Hawaii and Puerto Rico, made adjustments in their licensure legislation or practices, where these were required, to facilitate the licensure of graduates under the accelerated program Legislation in four instances (District of Columbia, Georgia, Illinois and Minnesota) is such as might not provide for students who have completed all their medical school work under the accelerated program and spend a week or two less than thirty-six months in a medical school

### PREMEDICAL TRAINING

The minimum requirement of the Council on Medical Education and Hospitals for admission to approved medical schools since 1918 has been two years of college

training, and in 1938 three years was recommended With the exception of California, Connecticut and Nebraska (table 14) the state licensing boards, by statute in the majority of instances, require that an applicant for licensure must present evidence of having completed two years of college In November 1942

TABLE 14.—*Requirements of Preliminary Training by Medical Licensing Boards*

| | | |
|---|---|---|
| **Two Years or More of College** | | |

| Nebraska | | |

* Two year college requirement for graduates after 1946

the Council on Medical Education and Hospitals recommended that for the duration of the war premedical education including satisfactory courses in physics, biology and inorganic and organic chemistry, be included within two calendar years Such a program was adopted by practically all medical schools of the country Many medical schools have already returned to the prewar premedical requirement of three years of premedical training

The Army Specialized Training and Navy V-12 premedical programs called for less than two years of college training, but in both of these programs the studies were continuous and provided for the student carrying more than the normal peacetime studies per semester Both the army and navy programs provided for work well in excess of the sixty semester hours constituting the normal two academic years of medical study The information received from those states whose licensure laws include specific premedical requirements seems to indicate that there should be no licensure difficulties encountered by students whose premedical

work was taken under the Army Specialized Training or Navy V-12 or comparably accelerated civilian programs

REQUIRED INTERNSHIPS

In tables 15 and 16 are listed the medical schools and licensing boards now requiring internships for the M D degree and licensure respectively Six schools in the United States and four in Canada require an internship for graduation Although relatively few schools require the internship for the M D degree, this is a requirement for licensure by twenty-three state medical licensing boards, the Arkansas and Connecticut homeopathic medical examining boards, the District of Columbia, Alaska, the Canal Zone, Hawaii and Puerto Rico Table 17 lists these states and indicates the relationship of this requirement to the nine month internship Ten states, the Connecticut homeopathic examining board, Alaska, the Canal Zone, Hawaii and Puerto Rico will accept a nine month internship as fulfilling the internship requirement Eleven states and the District of Columbia require an additional three months in a civilian hospital

TABLE 16.—*Medical Licensing Boards Requiring an Internship of All Candidates*

| | | |
|---|---|---|
| Alabama | Montana | Puerto Rico |
| Alaska | Nevada | Rhode Island |
| Canal Zone | New Hampshire | South Dakota |

| District of Columbia | New Mexico | Vermont |
| Hawaii | North Dakota | Washington |
| Idaho | Oklahoma | West Virginia |
| Illinois | Oregon | Wisconsin |
| Iowa | Pennsylvania | Wyoming |
| Michigan | | |

Some states require the internship of graduates of medical faculties abroad and of reciprocity or endorsement applicants
Alabama Delaware Illinois, Iowa Michigan North Dakota, Pennsylvania, Rhode Island Utah, Washington and Wisconsin require the internship to be a rotating service, while New Jersey recommends this type of service

or military service but will permit applicants for licensure to write the examination on completion of the nine month internship but will withhold the license until this is completed In two states physicians are not eligible to take the examination until after com-

TABLE 17.—*Relationship of the Nine Month Internship to Licensure*

| Accepted as Fulfilling Internship Requirement | Additional Three Months in Civilian Hospital or Military Service Required: Will Give Examination at End of Nine Months | Additional Three Months in Civilian Hospital or Military Service Required: Will Not Give Examination Until Completion of Year's Service |
|---|---|---|
| Alaska | Alabama [1,2] | Arkansas (homeo board) |
| Canal Zone | Delaware | Illinois [2] |
| Connecticut (homeo board) | Dist of Columbia [1] | New Mexico |
| Hawaii | North Dakota | |
| Idaho | Oregon [1,2] | |
| Iowa [1] | Rhode Island [1] | |
| Michigan [1] | South Dakota [1,2] | |
| Montana [1] | Utah [1,2] | |
| Nevada | Vermont [1] | |
| New Jersey | Washington [1] | |
| New Hampshire | Wisconsin | |
| Oklahoma [1] | Wyoming | |
| Pennsylvania [1] | | |
| Puerto Rico | | |
| West Virginia | | |

1 Will also give examination on completion of the medical course but withhold license until internship is completed
2 Military medical service must be in a military hospital
Some states require the internship of graduates of medical faculties abroad and reciprocity or endorsement applicants
Alabama, Delaware Illinois Iowa Michigan North Dakota Pennsylvania Rhode Island Utah Washington and Wisconsin require the internship to be a rotating service, while New Jersey recommends this type of service

pletion of a year's internship three months of which may be in the military service This is true also of the homeopathic examining board in Arkansas

Five states (Connecticut, Maryland, Missouri, Texas and Virginia) whose laws do not require an internship withhold the licenses of candidates from schools requiring an internship for the M D degree until the internship is completed In these states the examination may be taken at any time after completion of the medical school course

The licensing boards of Alabama, Delaware, Illinois, Iowa, Michigan, North Dakota, Pennsylvania, Rhode

Island, Utah, Washington and Wisconsin require the internship to be a rotating service, while New Jersey recommends this type of service

A few of the medical schools and licensing boards maintain their own list of hospitals acceptable for intern training, but the list of approved internships compiled by the Council on Medical Education and Hospitals of the American Medical Association is generally used

### LICENSURE FOR THE RELOCATED PHYSICIAN

To assist the physician returning to civilian practice or in locating in areas where there are shortages of physicians, the licensing boards of fifteen states, Alaska and Puerto Rico in 1945 provided for the issuance of temporary permits, usually without immediate examination These states, the length of the validity of the permit and the number of permits granted during the last calendar year are shown in table 18 Four states

TABLE 18.—*Temporary Permits, 1945*

| State | Permit Valid For | Permits Granted |
|---|---|---|
| Alaska | 6 mos | 10 |
| Arizona | 3 mos | 57 |
| Florida [1] | | 18 |
| Georgia | Next board meeting | 26 |
| Kentucky | 1-5 yrs | 6 |

| Puerto Rico | 6 mos after cessation of hostilities | 12 |
| Virginia | Next board meeting | |
| Washington | Next board meeting | 110 |
| West Virginia | Next board meeting | 10 |
| Total | | 323 |

1 Temporary permit regulation terminates July 1 1946

(Arkansas, Delaware Kansas and Wyoming) discontinued this emergency measure in 1945, and the Florida regulation will terminate on July 1, 1946 All licenses in Nevada in the past several years have been issued as temporary licenses which will expire on June 30, 1947 The Nevada board held a meeting on Feb 4, 1946 to reconsider the status of physicians holding these temporary licenses with a view to granting permanent licenses There were 323 temporary permits granted in 1945 by seventeen licensing boards

The Bureau of Information of the American Medical Association is helping veteran medical officers with their medical practice and relocation problems This is done through close association with state and county medical societies as an entirely voluntary effort without any attempt to direct the location of a physician

An officer can obtain a brief but comprehensive picture of the economic status of any particular area he is interested in from the data contained on county summary sheets This includes data on population, principal cities, physicians, hospital and medical facilities and pertinent economic, social and financial information A copy of this summary sheet is forwarded to the inquirer, and a copy of the letter to him is sent to the state and county medical society concerned

In addition to the information contained on the summary sheets, other data are available for interested officers Requests for full or part time salaried medical positions from industries, institutions and other organizations, requests from practicing physicians for associates, needs for specialists and requests of individuals for practices are cross filed and kept current by a return post card system which keeps the Bureau of Information informed of final locations, filling of vacancies and the securing of physicians

At the request of the Committee on Postwar Medical Service, the secretary of the Federation of State Medical Boards of the United States canvassed the respective licensing boards of the country on several points pertaining to the licensure of returning medical officers The report of the secretary to the federation on Feb 12, 1946 [3] is as follows

1 Medical officers desiring to relocate after separation from military service will be required to satisfy peacetime licensure regulations in the states concerned, except in New York, North Dakota and Pennsylvania, where special consideration is given to such applicants

2 Medical officers who are graduates of unapproved medical schools will experience difficulty in obtaining licensure in any state except Illinois and Massachusetts, although New York is giving special consideration to medical officers

3 Medical officers who entered military service without obtaining a license to practice in any state, with the exception of diplomates of the National Board of Medical Examiners, will be required to take the regular licensure examination in the state where they expect to practice.

4 A limited number of states have provision for temporary licensure, but only for the duration of the war and six months thereafter

5 As regards the licensure requirement for hospital residents which prevails in twelve states and the District of Columbia, and to a limited extent in four more states, it seemed evident that hospital residencies desired for returning medical officers should be regarded as a form of postgraduate or refresher courses of training, and therefore these physicians might be relieved of licensure requirements particularly if restriction of practice is rigidly observed Several state boards are considering the matter in this light

At its December 1945 meeting the Council on Medical Education and Hospitals of the American Medical Association passed the following resolution

The Council on Medical Education and Hospitals of the American Medical Association does not intend to remove any hospital from the lists of hospitals approved for internships or residencies which furnishes teaching facilities to any veteran medical officer who is eligible for educational benefits under the Servicemen's Readjustment Act, provided the veteran is legally eligible for medical licensure in the state in which the hospital is located

This action of the Council was approved by the Federation of State Medical Boards at its meeting on Feb 12, 1946 The American College of Surgeons is also in accord with this policy of the Council on Medical Education and Hospitals

TABLE 19.—*States Requiring Annual Registration*

| | | |
|---|---|---|

in table 20 For each year there is recorded the number who passed and failed licensing examinations Totals for the five year period and the percentage of candidates who failed are also given

During this five year period 35 904 examinations were given, 31,008 were successful tests and 4,896, 13 6 per cent, failed New York leads in the number of examinations given In this state in the last five years 3,333 passed the licensure examination Other states passing more than 2 000 included Pennsylvania 2 656 and California 2,291 More than 1,000 were examined in eight other states and passed, namely Illinois, Louisiana, Michigan Minnesota Missouri, Ohio, Tennessee and Texas

The greatest percentage of failures, 60 0, occurred in Massachusetts The high percentage in this state is due to the fact that, by law, the licensing board admitted to its examinations the graduates of unapproved medical schools and graduates of osteopathic schools, many of whom repeatedly fail A recent amendment to the medical practice act provided for a state approving authority This authority has ruled that students matriculated in institutions not meeting the standards of the authority after Jan 1, 1941 will not be eligible to take the licensing examination New York had a failure percentage of 44 6, occasioned in large part by the admittance to examination of a considerable number of graduates of foreign medical schools, who likewise repeatedly fail in large numbers The numbers of such graduates admitted to licensure has been decreasing in the last few years Other high percentages of failure occurred in Connecticut, Maine, Nevada and New Hampshire On the other hand thirty-seven states failed less than 5 per cent in the five year period These included eleven states which had no failures Arizona, Arkansas, Delaware Indiana, Kansas New Mexico, Oklahoma, South Dakota, Utah, West Virginia and Wyoming The percentage of failures in all states has decreased from 19 7 in 1941 to 9 9 in 1945 The lowest percentage of failures in this five year period occurred in 1945, when 9 9 per cent failed

These figures represent examinations given and not individuals A candidate who fails more than once in a state in a given year is counted only once, but should he also fail in a succeeding year he is counted in that year also The same is true of successful candidates who migrate to other states This group represents a recapitulation of the statistics computed annually and assembled for comparative purposes It gives only a fair approximation of the number of physicians added to the profession in five years by the written examination method Table 13, page 122, gives the corrected compilation of the number of physicians representing additions to the medical profession

TABLE 21.—*Registration 1904-1945*

| Year | Examined | Passed | Per centage Failed | Reciprocity or Endorsement | Total Registered |

REGISTRATION 1904 1945

A study of totals and percentages for forty-two years (1904–1945) is included in table 21 This tabulation covers physicians registered by written examination and by reciprocity or endorsement of credentials There is no definite trend in the numbers annually registered

TABLE 22.—*Graduates of Approved Schools and Others Registered 1922-1945*

| Totals | 170 .06 | 88 4 | 22 246 | 11 6 | 192 4.. |

from 1904 to 1933, although in 1918 the number registered dropped to the all time low record of 4,231 After 1933 there was an upward trend for a time, followed by a decline during the years 1941 and 1942 The sudden withdrawal of more than 1,200 in 1918 was due to the sudden withdrawal of physicians and recent graduates from civilian life during World War I

By contrast in 1943 the number registered increased 1,234 over the preceding year The increase is a result of the accelerated curriculum and the universal effort on the part of the medical leaders of the country to maintain a steady flow of physicians for both civilian and military practice In 1943 more physicians were examined than in any previous year A large majority of these were recent graduates who secured licenses before assuming military duties

There was a large increase in registration on the basis of credentials in 1945 It is presumed that medical officers returning to civilian practice are making use of this means of obtaining licensure if they are planning to relocate rather than return to their former practice

The percentage of failures gradually dropped from 19 3 in 1904, when a great many proprietary medical schools were functioning to 5 7 in 1930 Improvements in the standards of medical education are reflected in this decrease of failures in licensing examinations With the migration of European physicians to this country beginning in 1936 and the resultant licensure difficulties, the proportion of failures began to rise, reaching a peak of 20 7 per cent in 1940 In the last two years the number of foreign graduates and graduates of unapproved schools applying for licensure has considerably decreased

In analyzing this table it should be remembered that the figures represent multiple examinations by individuals in some instances rather than actual additions to the profession

GRADUATES OF APPROVED SCHOOLS AND OTHERS REGISTERED 1922 1945

The educational fitness of physicians registered for the practice of medicine in twenty-four years is recorded in table 22 In the computation of these figures, schools

rated as class A and B by the Council on Medical Education and Hospitals of the American Medical Association since 1907 are classified as approved In the column "Others" are included individuals who graduated prior to 1907, when the first classification of schools was made, graduates of foreign faculties of medicine, class C graduates, osteopaths given recognition by medical licensing boards and graduates of schools not approved by the Council In 1928 the classification A, B and C by the Council was discontinued and a list of approved medical schools has since been maintained

There were 8,953 candidates registered in 1945 of whom 8,225 91 9 per cent, represented graduates of approved schools and 728, 8 1 per cent, the group designated as others

In the twenty-four year period 192,452 were registered, including 170,206 approved graduates (88 4 per cent) and 22,246 others (11 6 per cent) Since 1922 the number of graduates of approved schools has increased well beyond 4,500, representing 80 to 90 per cent of those annually registered Until the influx of foreign graduates in 1936, those in the second group since 1924 have been fewer than 1,000 The number

in this group was considerably decreased in 1944, and in 1945 there were 142 fewer registered than in the preceding year

### GRADUATES OF UNAPPROVED SCHOOLS REGISTERED 1940-1945

Recorded in table 23 are data regarding graduates of institutions which do not meet the standards outlined by the House of Delegates of the American Medical Association and administered by the Council on Medical Education and Hospitals. This table shows the numbers registered as medical licentiates in the United States, Hawaii and Puerto Rico by written examination or endorsement of credentials in the past six years, 1940 to 1945 inclusive. Figures are given separately for those licensed by written examination and by endorsement of credentials. In the six years shown seventeen states, Hawaii and Puerto Rico registered 1,008 by examination and 50 by endorsement of credentials. In 1945 there were 166 so registered, 156 by examination and 10 without written examination in nine states, namely California, Illinois, Massachusetts, Missouri, Nevada, New Hampshire, New Mexico, Virginia and Wisconsin.

The large numbers of unapproved graduates licensed in Illinois and Massachusetts result from the nature of the licensing laws in these two states, which accounted for over 90 per cent of these licenses. However, 81 graduates of substandard schools have been licensed in other states in the past five years.

### GRADUATES OF SCHOOLS OF OSTEOPATHY REGISTERED BY MEDICAL EXAMINING BOARDS 1940-1945

The numbers of graduates of schools of osteopathy granted the privilege of practicing medicine or surgery or both by the examining boards of fourteen states and the District of Columbia for six years (1940-1945) are given in table 24. There have been 878 such individuals registered since 1940, 765 by examination and 113 by endorsement. In 1945 there were 144 so registered, 109 by examination and 35 without written examination in ten states, namely Colorado, Connecticut, Indiana, Massachusetts, Nebraska, New Jersey, Ohio, Oregon, Texas, Wisconsin, and in the District of Columbia.

Following is a summary of the situation in the fourteen states and the District of Columbia providing for the licensure of osteopaths by the medical examining board.

In Colorado an osteopath receives a license to practice medicine. In Connecticut any registered osteopath

TABLE 25.—*Requirements of Candidates for Medical Licensure on the Basis of Credentials Obtained in Countries Other Than the United States and Canada*

* Refer to chart of Reciprocity and Endorsement Policies for further data

1 Certificate of National Board of Medical Examiners and licensure in country in which school of graduation is located.
2 Internship or one year in medical school in United States
3 Certificate of National Board of Medical Examiners
4 For graduates of last five years. If more than five years $50
5 Residence of one year in Delaware
6 If similar privileges are accorded licentiates of District of Columbia by licensing agency of jurisdiction from which applicant comes
7 Senior year in class A medical school in United States
8 Graduates of European medical colleges after July 1 1936 Switzerland excepted shall not be eligible for licensure. Graduates prior to this date may be accepted for the regular written and clinical examination after completing rotating internships in approved hospitals in the United States
9 Enemy aliens not accepted
10 Application must be filed six months prior to date of examination
11 Licensed to practice medicine and surgery in country in which school of graduation is located, otherwise required to complete senior year in approved medical school in United States
12 Diplomates of National Board of Medical Examiners eligible
13 License to practice medicine and surgery in the country in which the school of graduation is located
14 Matriculants after Jan. 1 1940 not accepted
15 At the discretion of the board
16 Internship and graduate work
17 Internship completed in foreign countries after July 1 1934 not acceptable
18 Rotating internship in approved hospital in the United States or completion of senior year in class A medical school in the United States
19 *These requirements apply also to graduates of Canadian schools*
20 Graduates from foreign medical colleges accepted if they present also a diploma from an approved medical school in the United States
21 Provided standard was the same as California on the same date
22 Degree from an American medical college acceptable to the Medical Council of Delaware required
23 Diplomates of the National Board of Medical Examiners accepted. Citizenship required
24 Very limited number contracting to practice in rural districts may be accepted
25 Effective July 1 1943
26 Homeopathic board requires one year internship in homeopathic hospital in the United States
27 Will consider limited license for applicant with acceptable credits from National Board of Medical Examiners and states maintaining reciprocity

may practice either medicine surgery or both as the case may be if he passes a satisfactory examination before the medical examining board In Delaware osteopaths are licensed as "osteopathic physicians" In the District of Columbia osteopaths are granted the right to practice surgery In Indiana the licenses issued to osteopaths under a 1945 amendment to the medical practice act authorize the holders to practice medicine and surgery Licentiates in osteopathy prior to 1945 have now been authorized to practice osteopathy, surgery and obstetrics In Massachusetts the medical practice act, by definition includes osteopathy in the practice of medicine and does not differentiate the type of license issed to an osteopathic applicant According to a law passed in Nebraska in 1943 "any person now licensed to practice osteopathy may, if application is made prior to July 1, 1948 and upon payment of the prescribed fee, take the first regular examination given after the application is made before the Board of Examiners in Medicine If successful he or she shall receive a license to practice medicine and surgery in the state" In New Hampshire osteopaths are granted the right to practice medicine and surgery New Jersey provides that osteopaths licensed prior to Nov 1, 1941 who furnish proof, prior to that date, of having served for a period of two years as an intern or resident surgeon in an osteopathic or medical hospital approved by the board of medical examiners, of having completed a postgraduate course of two years in a college of osteopathy or medicine approved by the board or of having had at least three years of practice in a hospital approved by the board can be admitted to an examination in pharmacology therapeutics and surgery and, if successful, can obtain a license to practice medicine and surgery Since 1941 all osteopathic applicants who have met the requirements of the medical practice act have been licensed to practice medicine and surgery

A law passed in Ohio in 1943 gives osteopaths who obtain their licenses under that act the right to practice osteopathic medicine and surgery In Oregon they are granted the right to practice "in the subjects" covered by the examination, which includes surgery The medical practice act of Texas provides for the issuing of a license to practice medicine only and osteopaths are issued licenses unrestricted in scope In Virginia osteopaths may obtain the right to use drugs and perform surgery with the use of instruments if they satisfy the board of medical examiners that they are qualified to do so Wisconsin grants osteopaths the privilege to practice surgery and in Wyoming the statutes contain no specific provision for the licensing of osteopaths The medical practice act of the latter state provides that the certificate issued to all applicants "shall be deemed licenses to practice medicine in all branches in which the applicant has taken examination in the state"

## PHYSICIANS EXAMINED ON BASIS OF CREDENTIALS OBTAINED IN COUNTRIES OTHER THAN THE UNITED STATES AND CANADA

The Council on Medical Education and Hospitals does not grade or classify medical schools outside the United States and Canada It does not attempt to evaluate institutions which it is not in a position to visit to determine whether they meet the minimal essentials of an acceptable medical school as outlined by the Council This was true even before the war

For a period of twelve years beginning in 1926 the credentials of physicians coming from abroad were verified by the Council through official correspondence with the medical schools directly or through the diplomatic services Prior to the onset of the war in Europe it was necessary to discontinue this effort and on the licensing boards rests the responsibility of evaluating the credentials presented by these graduates In the 1942 edition of the American Medical Directory a symbol in the biographic data of foreign graduates indicates when the information given is the licensing board's record of the credential accepted as meeting the educational qualifications for licensure The absence of the symbol may be interpreted to indicate that official verification is on file in the office of the Council

The requirements of candidates for medical licensure in the United States, Alaska Hawaii and Puerto Rico on the basis of credentials obtained in countries other than the United States and Canada are given in table 25 Eighteen states report that the holders of such credentials are not eligible for licensure Eighteen states, Alaska, Hawaii and Puerto Rico require full citizenship and ten naturalization papers as a condition precedent to taking the examination California, Indiana and the District of Columbia make no reference to citizenship In some states the recognition or nonrecognition of such individuals is by rule of the board, in others the provision is by statute Ten states that will admit foreign graduates to practice require a certificate from the state board of examiners in the basic sciences In nineteen states, Alaska, Hawaii and Puerto Rico an internship in a hospital in the United States is a prerequisite Additional qualifications of individual states are given in footnotes No state has changed its laws regarding these graduates or relaxed its requirements in recent years

Table 26 presents figures relating to physicians examined on the basis of credentials obtained in countries other than the United States and Canada by licensing boards in 1945 The figures represent both American and foreign born physicians educated abroad Seventy-five faculties of medicine and three licensing corporations of eighteen European countries and nine other countries are represented There were 475 physicians examined by twenty-five states, the District of Columbia and Puerto Rico, of whom 209 passed and 266,

TABLE 27—*Physicians Examined on the Basis of Credentials Obtained in Countries Other Than the United States and Canada, 1930-1945*

| Puerto Rico | Dr. O. C. Mandy, Box 3854, Santurce |
| Virgin Islands | Dr. K. Knud Hansen, Charlotte Amalie |

Bologna and Lausanne also were examined in the United States last year. Fewer than 5 graduates of fifty-one foreign schools appeared for licensure last year.

The greatest number of foreign graduates examined by any one state was 320 in New York, of whom 128 passed and 192 (60.0 per cent) failed. No other state tested more than 29 of these physicians. Fewer than 5 were examined by nineteen states and Puerto Rico.

Table 27 records the number of graduates of faculties of medicine abroad examined for medical licensure in the United States in the sixteen years 1930 to 1945 inclusive. In this period 13,424 were examined, of whom 7,043 passed and 47.5 per cent failed. There has been a decrease of 216 in the number examined in 1945 as compared with the previous year. Although there has been a considerable reduction in the number of foreign graduates seeking licensure in recent years the percentage of failures has not changed significantly. The greatest number of failures occurred in 1941, when 59.2 per cent failed. At no time in this sixteen year period did fewer than 30.7 per cent fail.

From 1936 to 1940 there were large annual increases in foreign graduates examined, so that in 1940 there were over three times as many tested as in 1936. Since 1940 there have been annual decreases. The number examined last year was 1,613 fewer than that of 1940, but the annual total has not yet reached the average number of foreign graduates examined prior to 1935 and before the increased migration of foreign physicians to this country from Europe.

## BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Seventeen states and the District of Columbia have adopted by legislative action basic science requirements underlying the practice of the healing art. A basic science law provides for the establishment of a board of examiners and requires that each person who desires to practice the healing arts appear before that board and demonstrate his knowledge. Such boards are distinct from licensing boards. A certificate of proficiency in the basic sciences does not authorize the possessor to practice the healing art, it enables him only to apply for licensure so to practice. Some states provide for reciprocal agreements.

TABLE 28.—*States Having Basic Science Laws and Year of Enactment*

| | | | |
|---|---|---|---|
| Arizona | 1936 | Nebraska | 1927 |
| Arkansas | 1929 | New Mexico | 1941 |
| Colorado | 1937 | Oklahoma | 1937 |
| Connecticut | 1925 | Oregon | 1933 |
| District of Columbia | 1929 | Rhode Island | 1940 |
| Florida | 1939 | South Dakota | 1939 |
| Iowa | 1935 | Tennessee | 1943 |
| Michigan | 1937 | Washington | 1927 |
| Minnesota | 1927 | Wisconsin | 1925 |

Connecticut and Wisconsin were the first states to adopt such legislation. Laws were passed in these states in 1925. Other states comprising the group, together with the year of enactment of their basic science law, are recorded in table 28.

The subjects in which examinations are conducted by the respective states and the District of Columbia are shown in table 29. These subjects are specified by statute. The examining boards are not authorized to add any subjects or to fail to examine in any subject specified by the law. All eighteen boards examine in anatomy, pathology and physiology, sixteen examine in chemistry, fourteen in bacteriology, eight in hygiene, two in diagnosis and one in public health.

The results of examinations held in these states and the number of certificates issued on the basis of reciprocity or endorsement during 1945 are presented in tables 30 and 31 as reported by the respective boards. A candidate in applying for a basic science certificate

is not required to mention his school of practice However, by checking the biographic records of physicians and medical student records of the American Medical Association and various directories it has been possible to determine the profession of the majority of candidates Thus it has been possible to tabulate the figures in four groups, namely physicians and medical students, osteopaths, chiropractors and unclassified applicants The latter category includes those for whom it was not possible to determine the profession represented In Rhode Island doctors of dentistry represent the unclassified group It may be assumed that others in this unclassified group include osteopaths, chiropractors and also naturopaths who have not been identified by the reference material available

A total of 2,979 candidates (table 30) were examined by the eighteen boards in operation in 1945 Of this number 2,559 were physicians or medical students, 183 were osteopaths, 33 were chiropractors and 181 were placed in the unclassified group Of all applicants 21 7 per cent failed Of the physicians and medical students examined 16 4 per cent failed, osteopaths 43 7 per cent, chiropractors 75 8 per cent and unclassified 54 7 per cent If a candidate failed more than once in a given year in a state he is regarded as a single

failure Among those who passed there were 2,139 physicians and medical students, 103 osteopaths, 8 chiropractors and 82 unclassified candidates The basic science boards of Florida and Michigan examined the greatest number of applicants In each of these two states 398 were tested In Florida this group represented 363 physicians and medical students and 35 others, while in Michigan there were 381 physicians or medical students and 17 others Of those examined in Florida 25 9 per cent failed and in Michigan 28 9 per cent Iowa, Minnesota and Wisconsin also examined more than 300 candidates The percentage of failures in these states was 47 9, 13 1 and 9 2 respectively Three states reported no failures

Osteopaths were tested in all states except Arkansas, District of Columbia, Nebraska, Rhode Island, Tennessee and Wisconsin Chiropractors appeared for examination in Connecticut, Florida, Iowa, New Mexico, Rhode Island, Tennessee, Washington and Wisconsin

It is the policy of the Arizona Board of Examiners in the Basic Sciences to omit the names of applicants who fail examinations Failures for this state are recorded only in the total column

Thirteen states issued 584 certificates by reciprocity, endorsement or waiver, and the boards of all states granted 2,315 certificates after examination Altogether, 2 899 certificates of proficiency were issued The number of successful applicants by both of these methods are recorded in table 31 Among the successful candidates were 2,534 physicians, 263 osteopaths,

reciprocal relations None were certified without examination in Connecticut, District of Columbia, and Rhode Island

The figures for certificates issued by examination in Arizona and Tennessee in table 31 do not agree with the examination figures of the preceding table In Arizona 8 candidates were examined in 1944 and certi-

fied in 1945, while in Tennessee 25 were examined in 1945 and were not certified until 1946. The latter group will be included in next year's compilation of basic science tests.

Altogether, 2,899 candidates received basic science certificates in seventeen states and the District of Columbia, ranging from 18 in the District of Columbia to 390 in Wisconsin.

| 1945 | 18 | 2,559 | 2,139 | 420 | 16.4 | 414 | 2,553 | 397 | 193 | 204 | 51.4 | 172 | 365 |
| Totals | | 22,480 | 19,542 | 2,938 | 13.1 | 4,016 | 23,558 | 3,534 | 1,795 | 1,739 | 49.2 | 916 | 2,711 |

In table 32 is included the number of candidates examined and certified by basic science boards for each year since and including 1927. In 1928, when five boards were functioning, there were 646 physicians examined, of whom 9.3 per cent failed and 59 other practitioners of whom 47.5 per cent failed. By comparison, in 1945 the eighteen boards in operation examined 2,559 physicians of whom 16.4 per cent failed and 397 other practitioners, with 51.4 per cent failures.

In the nineteen year period 22,480 physicians and medical students were examined, of whom 19,542 were successful in these examinations. In the same period 3,534 other practitioners took the test and 1,795 were successful. Of the physicians or medical students examined during these years, 13.1 per cent failed and 49.2 per cent of the other practitioners were unsuccessful. There were in this same period 4,016 physicians and 916 others certified without examination.

In nineteen years 26,164 certificates have been granted by basic science boards. These certificates were awarded to 23,453 physicians and medical students and 2,711 other practitioners.

No new basic science legislation was enacted in 1945.

There was created a basic science examining board in Virginia in 1944 to consist of three members appointed by the governor from the faculties of the accredited colleges and universities of the state. None of the members may be a practitioner of any branch of the healing art. The board will cease to function July 1, 1949. It was created solely to examine a group of naturopaths and chiropractors who were practicing in the state without benefit of license during the twelve month period prior to July 1, 1944. Such practitioners must within the five year period either pass an examination given by this board in anatomy, bacteriology, elementary chemistry, pathology and physiology or must pass the examination given by the state board of medical examiners. The basic science board has no function whatever in connection with any other applicant for a license.

The basic science acts in two states were amended in 1945. In Arizona the act was amended to provide that an applicant who is a citizen of the United States who furnishes proof of a certification, registration or license issued to him "within any state or territory of the United States in which the requirements for the registration of said applicant at the date of issuance of his license shall be deemed by the board to be equivalent to those of Arizona shall be eligible for registration by reciprocal endorsement at the discretion of the board." In Tennessee the amendment now in effect imposes a basic science requirement on osteopaths, chiropractors and naturopaths in addition to physicians.

The principle of basic science legislation is to provide a means of insuring that all who seek licensure to care for sick and injured persons shall first possess a reasonable knowledge of the sciences fundamental to the healing art. The enforcement of such laws affects mostly the group classified as "other practitioners." This is particularly significant when one takes into account that the testing of individuals for basic science registration is made by nonmedical examiners. The results demonstrate that, in general practitioners other than regular physicians are poorly equipped in the fundamentals of medicine and should not be entrusted to care for the health of the people.

Efforts are being made by the American Association of Basic Science Boards to provide information based on experience to states contemplating new basic science board legislation and to develop procedures to facilitate reciprocity arrangements. In some instances basic science certification by reciprocity is unnecessarily difficult because of otherwise unimportant differences in the laws of the various states. At the February 1946 meeting of the Federation of State Medical Boards a resolution was adopted authorizing the President to appoint a committee of three to meet with a similar committee representing the state basic science boards in an effort to integrate better the operation of basic science laws with the system of medical licensure now existing in the various states.

## NATIONAL BOARD OF MEDICAL EXAMINERS

The licensing authorities of forty-four states, the District of Columbia and the territories and possessions of Alaska, Hawaii, Puerto Rico and the Canal Zone accept the certificate of the National Board of Medical Examiners as an adequate qualification for a medical license The National Board certificate is not recognized by the licensing boards of Florida, Indiana, Montana and Wisconsin At present Louisiana exempts diplomates of the National Board from the state examination if they have been licensed in some other state with which Louisiana reciprocates Additional examinations are required of those who hold the certificate of the National Board by some of the states recognizing the certificate These are oral examinations in Illinois Maine Rhode Island and Wyoming, and a brief supplemental examination in Michigan States, territories and possessions endorsing the certificate of the National Board are listed in table 33

The examinations of the National Board in the basic sciences are accepted in lieu of the examinations in those subjects required by the basic science boards of Connecticut Iowa, Minnesota Nebraska, New Mexico, Oklahoma, Tennessee and the District of Columbia

Diplomates of the National Board are admitted to the final examination of the Examining Board in England, of the Triple Qualification Board of Scotland and of the Conjoint Board in Ireland These final examinations are both written and oral and correspond to parts II and III of the National Board The National Board admits directly to parts II and III the

Spain, Turkey and other foreign countries It is also recognized under certain conditions by the South African Medical Council Diplomates are also admitted without further examination to the Mayo Foundation (Graduate School of the University of Minnesota) and are exempt from some of the qualifications required by the United States Public Health Service

Requirements for admission to the National Board examinations include a standard four year high school course, two years of acceptable college work including English, physics, chemistry, biology and a foreign language, and a medical education satisfactorily completed in an approved school in this country or Canada Graduates of the university medical schools of Great Britain and Ireland are admitted to the examination provided these graduates have been licensed to practice in the country in which the school attended is located

The almost universal recognition of the examinations of the National Board is evidenced by the acceptance of the board's examinations by many medical schools as part of their own examination and promotion procedure At some of the schools the students are required to pass part I at the end of the second year and part II at the end of the fourth year Other schools require that part II be passed at the end of the fourth year Candidates who fail to pass the National Board examinations are given a supplemental examination at most schools The schools that require practically all of their students to take the National Board's examinations under one plan or another are Albany, Boston Buffalo, Duke, George Washington, Harvard, Long Island, New York Medical College, Tufts and Yale In addition to the schools named there are a few others at which those students who voluntarily take and pass the National Board's examinations, either in part I or in part II, are excused from the corresponding final school examinations This group of schools includes Colorado, Georgetown Illinois, Loyola, Minnesota, Pennsylvania and the Woman's Medical College

In the following paragraphs data are presented for the twenty-eighth consecutive year regarding the examinations conducted and the issuance of certificates by the National Board of Medical Examiners These data are based on official reports received periodically from the executive office of the board The awarding of certificates to candidates forms a part of their biographic records maintained by the American Medical Association

The first examination was given by the National Board in October 1916. From then until the test held in June 1921, eleven examinations were held and 268 candidates were certified. The results of each examination during this period are given in table 34.

Since 1922 the examination of the National Board has been divided into three separate parts which must be taken and completed in the following sequence: part I, consisting of a written examination in the basic sciences, part II, a written examination in five major clinical subjects, and part III, a clinical and practical examination in six major clinical divisions and their component subjects or subdivisions.

TABLE 37.—*National Board Examinations in Part III, 1922-1945*

| | Total Examinations | Passed | Failed | Percentage Failed |

| 1944 | 1,167 | 1,145 | 22 | 1.9 |
| 1945 | 1,231 | 1,218 | 13 | 1.1 |
| Totals | 13,899 | 13,443 | 456 | 3.3 |

The tables that are presented herewith enumerate the results of examinations in parts I, II and III for each calendar year since 1922, including those who passed and failed examinations and those certified.

During 1945 four examinations were given in part I and three in part II in various approved medical schools. Examinations in part III are given under the direction of local subsidiary boards at times sufficiently frequent to accommodate all eligible candidates. Boards have been organized for this purpose in twenty-four centers throughout the United States. Such examinations were held in 1945 during the months of January, June and July and in October.

A candidate is eligible for part I who has completed successfully the first two years of the medical course. An incomplete examination is allowed candidates at the end of their second medical year in schools whose third year curriculums include courses in one or two subjects of this part. These subjects may be taken at any examination period after the candidate has completed them in his medical school. They are recorded in these statistics under the heading "Incomplete Examinations."

A candidate is eligible for part II after completing a four year medical course and passing part I.

The figures in tables 35, 36 and 37 cover details of each examination given during 1945 and include some who fail and are reexamined during the same year and those who pass parts I and II in the same year. They

TABLE 38.—*Parts I, II and III, Excluding Duplications 1922-1945*

| | Total Examined | Passed | Incomplete | Failed | Percentage Failed |
|---|---|---|---|---|---|

| 1945 | 5,014 | 4,468 | 896 | 200 | 5.5 |
| Totals | 59,085 | 47,028 | 8,171 | 4,396 | 8.6 |

represent, therefore, examinations conducted and not individuals examined.

Since 1922 there have been 35,017 examinations given in part I and 18,020 in part II. During this twenty-four year period 21,296 were successful tests in part I and 16,799 in part II. The percentage of failures was 14.4 in part I and 6.5 in part II. The wartime accelerated program in operation in all medical schools is evidenced by the increase in the number of candidates taking the examination since 1942. The greatest number of examinations in part I were given in 1944 and in 1945 there were 362 fewer than in the preceding year. Those given in part II in 1945 were 193 in excess of the previous year.

During the year 1944, 3,865 examinations were given in part I, 2,106 were passed and 284, or 11.8 per cent, failed. During the year 1,475 incomplete examinations were given. In part II, 1,598 examinations were held. Thirty-four of this number, 2.1 per cent, were failures. Incomplete examinations are only rarely given in part II. There were none last year.

Part III, the final examination of the National Board, is given when the candidate has received the M.D. degree and has satisfactorily completed an internship

in a hospital approved by the Council on Medical Education and Hospitals or by the Canadian Medical Association or has served in a laboratory acceptable to the National Board During the war period candidates were permitted to take part III after nine months of internship, but their certificates were withheld until three additional months had been served as a hospital intern or resident or on active duty in the medical department of the armed forces In 1945 1 231 tests were given in part III, 13 of which (1 1 per cent) were unsuccessful Results of examinations in this part during twenty-four years are given in table 37 and indicate that 13 899 were tested of whom 13,443 were granted certificates The percentage of failures in twenty-four years was 3 3 Since the inception of the National Board in 1916 13,711 certificates have been awarded

Physicians who earn the certificate are designated Diplomates of the National Board and are privileged to use the designating initials D N B

The tabulations thus far presented represent examinations given The number of individuals tested during any one year is recorded for the twenty-four year period in table 38 The classification as "passed" or "failed" in cases in which more than one examination has been taken in a given year was based on the results of the last examination during the year in question For example, if in 1945 a candidate passed part I but later in 1945 failed part II he is computed in the tabulation as having failed By this computation figures indicate that there were 5 614 who took at least one of the tests of the National Board in 1945, as compared with 525 in 1922 The trend has been steadily upward, especially since 1942 Last year the number of candidates was 251 greater than in the previous year which exceeded the 1943 figure by 850 A total of 59 585 were examined in one or more of the annual examinations in the twenty-four years shown of whom 47,028 passed, 8,171 took incomplete examinations and 4,396, or 8 6 per cent, failed

The 1,218 physicians certified as diplomates of the National Board of Medical Examiners last year represented graduates (table 39) from fifty-six existing and one extinct medical school in the United States three in Canada and 3 graduates of faculties of medicine abroad The National Board reports that it awarded diplomas from February 1922 to March 31, 1944 to 100 or more candidates from each of forty-five medical schools Harvard heads the list with 2,048 graduates

In 1945, 1,103 diplomates were granted licenses to practice medicine on the basis of their National Board certificate in 39 states the District of Columbia Hawaii and Puerto Rico The number so registered in each state is reported in table 40 Since the National Board was formed 10,028 physicians have been licensed to practice medicine on the basis of their credentials from the board In the same period 13 443 received the certificate of the board It would appear that 3,415 have not used the credential as a licensing medium

The constitution of the National Board of Medical Examiners provides for a membership of thirty representing the federal services, the Federation of State Medical Boards of the United States, the Association of American Medical Colleges, the Council on Medical Education and Hospitals of the American Medical Association and members elected at large The president of the board is Major Gen M W Ireland, M D the medical secretary J S Rodman M D, and the executive secretary and treasurer Mr Everett S Elwood The address of the board is 225 South 15th Street Philadelphia

## EXAMINING BOARDS IN THE MEDICAL SPECIALTIES

Examining and certifying boards have been established in fifteen specialties and all of these boards have been in operation since 1940 In 1934 the Council on Medical Education and Hospitals of the American Medical Association formulated minimal standards governing specialty boards, and these fifteen boards are fully approved

Two boards certify candidates in subspecialties The American Board of Internal Medicine certifies in allergy cardiovascular disease, gastroenterology and tuberculosis Similarly the American Board of Surgery certifies specialists in proctology Regular board certification is a prerequisite for certification in the subspecialty This function of the boards in internal medicine and surgery is also approved by the Council

The "Essentials of Approved Examining Boards in Medical Specialties," as prepared by the Council, outlines the type of organization and the responsibilities of such boards as well as the minimum qualifications deemed necessary for certification as a specialist Such qualifications include graduation from an approved

medical school, completion of an internship in a hospital approved by the Council, and a period of specialized training in a selected specialty Three years of special training and a further period of two years devoted to specialty study and/or practice are considered by the Council to be the minimal training required before specialty practice Some boards require more than this amount of training and education Each board publishes a booklet containing information regarding its organization personnel, purposes and requirements for certification A statement of these requirements for each board was given in detail in the Educational Number of THE JOURNAL in 1942 [4] Only a few minor changes have been made by some of the boards since these regulations were published in 1942

The Advisory Board for Medical Specialties was organized in 1933-1934 to coordinate graduate education and certification of medical specialists in the United States and Canada This board reports directly to the various boards and functions in close collaboration with the Council on Medical Education and Hospitals of the American Medical Association

The majority of the boards grant some credit for military service The policies adopted by the boards vary One board grants an indefinite amount of credit, to be determined by an evaluation of the experience of individual applicants Another grants full credit for work done in the surgical division of a regularly constituted army or navy hospital Most boards limit the credit allowed to one year of training and/or one year of experience The special provisions for military credit made by each board were published in the 1943 Educational Number of THE JOURNAL [5]

The 9-9-9 wartime graduate program curtailed the number of physicians desiring specialty certification The various boards are taking this into consideration and will probably allow credit for the actual time spent by the candidate in house officer training in approved hospitals for nine month periods

The Council on Medical Education and Hospitals cooperates with the various specialty boards in the approval of residencies and fellowships acceptable for certification The Council inspects and evaluates new residencies in most instances, it approves residency programs jointly with the specialty boards This program has been established so that approved services may be equally acceptable to the Council and to the respective specialty boards

An analysis of questionnaires returned by 21,029 medical officers pertaining to their future educational plans [6] indicates that over 12,000 medical officers will seek specialty certification after the war The Council working with specialty boards, hospitals, medical schools and the Committee on Postwar Medical Service, has made notable progress in meeting these educational needs of the future in the advanced training of specialists, particularly physician veterans

Because of the large number of applications for approval of residency training programs submitted by hospitals developing these programs in response to the increased demand for training by returning medical officers, the Council on Medical Education and Hospitals of the American Medical Association has approved a plan for the temporary approval of residencies This plan was developed in collaboration with the Advisory Board for Medical Specialties through its executive committee A majority of the American boards has already indicated an approval of the proposal The program is as follows

1 The Council on Medical Education and Hospitals of the American Medical Association has temporarily delegated to its secretary the authority to grant temporary residency approval on behalf of the Council subject to concurrence by the appropriate American board as described in No 2

2 Each participating American board has appointed representatives (usually one individual for each board) to consider new residencies for temporary approval with authority to act on behalf of the board

3 Temporary approval will be based on information from the hospital concerning the personnel facilities and educational program of the hospital service involved without immediate inspection Such approval will be granted only if the representatives of the Council and of the board are reasonably satisfied that the education program fulfils the standards of both bodies

4 Subsequently employing the usual procedures an inspection of the hospital will be carried out by the Council's staff On the basis of the inspection report the Council will consider the temporarily approved hospital for transfer to the regularly approved list in the usual manner The inspection report and the recommendations of the Council will be submitted to the appropriate board and the board will return its concurrence or disagreements with the Council The result of this procedure would be either (*a*) transfer of the temporarily approved residency to a fully approved status or (*b*) withdrawal of the temporary approval

5 In the event of withdrawal of temporary approval and failure to grant regular approval credit toward board certification will be given to physicians for that part of their training received while the residency was on a temporary approval status After such withdrawal of approval residents seeking board certification will be given a reasonable time to obtain another acceptable residency without loss of time credit. This means that no resident would be penalized so far as board credit is concerned for time spent in a temporarily approved residency

TABLE 41.—*Specialty Board Credit for Preceptorship Training*

| | Credit Awarded | Preceptors Limitations: Any Certified Board Member | Preceptors Limitations: Other Than Certified Board Member | Preceptors Limitations: List of Preceptors Maintained | Maximum Training Credit |

| Urology | Yes | No[1] | No | No | 3 years |

1. Facilities and teacher qualifications must be approved by board
2. To be considered at May 1946 meeting
3. Institution must be approved for graduate training

In seeking approval by the Council on Medical Education and Hospitals, those hospitals which organize new residencies should initially make no distinction between regular versus temporary approval Applications should be transmitted to the Council in the regular manner In the immediate future most applications will be considered at once for temporary approval The Council's staff will proceed with regular inspections as rapidly as possible, so that tranfer of acceptable hospital residencies from the temporarily approved to the regular approved list will take place as rapidly as possible if the inspection report seems to warrant such transfer in the

opinion of the representatives of the Council and of the American board concerned

As a substitute for special training, service with a qualified preceptor is recognized by some of the specialty boards The policies of the boards toward the acceptance of such training are briefly outlined in table 41 The exact time credit varies and in all instances is decided on an individual basis, depending on the amount of clinical responsibility and activity The individual facilities and teacher qualifications of the preceptor must be approved by the respective board This type of training is not acceptable to four boards, and one board has the matter under consideration Only five of the boards will give consideration to preceptor training carried out under a qualified specialist who is not himself certified by the appropriate board

Table 42 gives the annual number of specialists certified by all boards for the past five years The largest number (2,172) obtained certificates in the year ended March 1943 In the two succeeding years there were progressive decreases primarily because of the war Of all those physicians now certified, 39 per cent received their specialty credentials in the past five years

A list of the specialty boards and their officers and the number of certificates awarded prior to March 1,

| 1945 | 15 | 1,305 | 24,752 |
| 1946 | 15 | 1,356 | 26,108 |

1945 and the number certified until March 1, 1946 respectively appear in table 43 On March 1, 1945 there were 24,752 physicians certified by the fifteen boards, and in the following year 1,356 were certified Up to March 1, 1946 a total of 26,108 certificates had been awarded Included in these figures are 809 who had been certified in the subspecialties mentioned, namely allergy 81, cardiovascular disease 338, gastroenterology 171, proctology 72 and tuberculosis 147

In the specialties of internal medicine and surgery, 3,906 and 2,620 respectively have received the certificate of these boards However, the greatest number in any one specialty certified was in otolaryngology In this specialty 3,886 have received the board's certificate since its organization in 1927 The oldest board in existence, ophthalmology (organized in 1917), has to date certified 2,490

A key number has been assigned to each approved board, such as A B 1, and the biographic records of physicians published in the American Medical Directory includes by these means reference to those certified

The Council on Medical Education and Hospitals and representatives of the various boards, and the Advisory Board for Medical Specialties, annually hold a joint session for the interchange of ideas and the discussion of problems of mutual interest These meetings have proved to be worth while contributions to the improvement of medical education and medical practice in this country

TABLE 43.—*Approved Examining Boards in Medical Specialties*

## MEDICAL LICENSURE, 1945

Each of the special issues of The Journal containing material prepared by the Council on Medical Education and Hospitals reflects the cooperation of many institutions and agencies with the Council throughout the year The annual Hospital Number depends on the collaboration of more than six thousand hospitals The Educational Number would be impossible without the help of every medical and basic science school in the United States and Canada The medical licensure statistics for the calendar year 1945 appearing on pages 109 to 139 of this issue are based on reports transmitted to the Council throughout the year by every medical examining and licensing board in the United States, the District of Columbia and the territories and possessions of the United States, as well as all boards of examiners in the basic medical sciences, the National Board of Medical Examiners and each examining board in the medical specialties

The candidates whose examination results are reported represented sixty-nine approved medical schools in the United States, nine approved medical schools of Canada, seventy-five faculties of medicine and three licensing corporations of other countries, six medical schools now extinct, five unapproved institutions, six colleges of osteopathy and one individual who had not completed the medical course

During the year 1945 there were 9,153 licenses issued, 5,541 after examination and 3,612 by reciprocity and endorsement Of those licensed 5,707 represented real additions to the profession in this country, since many previously held licenses elsewhere The latter figure may be compared with the 3,815 physician deaths in 1945, indicating an increase of 1,892 in the net physician population

Never in the past four decades have there been as many licenses issued by reciprocity and endorsement as in the past year This is probably because unprecedented numbers of physicians are seeking new locations after the disrupting influence of the war

Failures of candidates in various categories in examinations given by state licensing boards followed the familiar pattern Only 2 5 per cent of graduates of existing approved medical schools failed On the other hand 40 8 per cent of those from unapproved schools failed and 56 0 per cent of the graduates of schools outside the United States and Canada did not pass

The upward trend in numbers of physicians certified by the American boards in the specialties has not yet become apparent but should become noticeable in a year or two as returning medical officers complete their educational programs Assistance to these men in fulfilling their plans has been provided not only by greatly increasing the regular residency openings but also by the adoption of a plan of temporary approval of residencies as well, which plan is described in this issue In addition, the policies of the specialty boards regarding the acceptance of preceptor training are given

The Council and The Journal greatly appreciate the contributions of the many agencies which made this material available Besides publication in The Journal, a reprint will be available Reprints of certain separate tables are also made to assist the Council in replying to the thousands of requests for information on licensure and related subjects received annually

## THE USE OF RADIOACTIVE IODINE IN THYROTOXICOSIS

When the biologists and medical scientists learned from the physicists that various elements can be made *temporarily radioactive by bombardment with streams* of certain particles, investigators sought for radioactive forms of those elements of most particular interest to them By means of radioactive isotopes the course of any element may be followed through the body, thus many old problems of metabolism have been restudied by physical, instead of chemical, means New explorations have been undertaken to which only the physical method is applicable

*In therapeutics also isotopes may be used* Radioactive phosphorus has been used in the treatment of leukemia and polycythemia Elsewhere in this issue appear two reports on the use of radioactive iodine in the treatment of thyrotoxicosis Because of the specific avidity of the thyroid for iodine it is possible, by making iodine radioactive, to place radiation directly within the cells which it is desired to irradiate Such application might be expected to be more effective than that of x-rays introduced from without

The papers of Hertz and Roberts and of Chapman and Evans indicate that a new and effective method of causing permanent remission in hyperthyroidism has become available Whether or not it will prove superior to all other forms of therapy for the malady in question cannot be foretold now Much more data must be accumulated before it can be asserted that radioactive

iodine gives the patient a better chance of permanent cure and freedom from untoward side effects than does subtotal thyroidectomy or prolonged treatment with an antithyroid drug The possibility, however, that treatment with radioactive iodine may possess such superiority makes extended study desirable

From the evidence thus far available it would appear that treatment with radioactive iodine can produce remissions in cases of thyrotoxicosis associated with hyperthyroidism However, the use of any form of radiation may be accompanied by late untoward side effects The late development of cancer as a result of irradiation, although perhaps unlikely, is certainly within the realm of possibility Thus far exact evidence is not available as to the effects of excretion of radioactive material by the kidney on the cells of that vital organ Until sufficient time has elapsed to permit the necessary studies of tissues of the body long after treatment with radioactive iodine has been given, no one can predict the exact place that it will occupy in the control of this disease

## ASCORBIC ACID IN TOMATO JUICE

Certain foods have attained a special position in the national dietary as vehicles for one or another nutritional essential Thus milk and milk products represent the best source of calcium, liver is outstanding in providing vitamin D and eggs are a favored item where protein and vitamin A are concerned In much the same way tomato juice has established itself not only as an appetizer but also because it is an excellent source of ascorbic acid, and for this reason its manufacture is an important phase of the food industry From the nutritional point of view the dietitian, the pediatrician and the consuming public are interested in the quality of the product with respect to the content of vitamin C Indeed, this interest has been recognized by the recent decision of the Council on Foods and Nutrition [1] in which a minimum standard of 20 mg of ascorbic acid per hundred cubic centimeters of juice was recommended That some such standard is desirable is indicated by the observations of Pressley and her associates [2] on the vitamin C content of seventy-nine samples of canned tomato juice, a variation of from 2 5 to 25.2 mg was recorded in this study

The factors which may influence the content of ascorbic acid in tomatoes have been examined The small fruited varieties—the so-called grape or pear tomatoes—contain much more vitamin C than the large fruited commercial varieties, the former group may contain as much as 63 mg per hundred grams of fruit whereas the latter averages closer to 25 mg [3] In general, variety appears to be an unimportant factor in influencing the vitamin C content of commercial types of tomato Hamner and his associates [4] found that the degree of ripeness, storage at temperatures of 65 to 90 F for ten to fourteen days, fertilization of the ground or humidity play an insignificant part in causing a variation of ascorbic acid content of tomatoes On the other hand, the Cornell investigators showed that the intensity of light to which the mature green fruit is exposed is a highly important factor in the production of a high content of vitamin C in tomatoes Other studies [5] have demonstrated that losses of ascorbic acid in picking, transportation and processing at the cannery are of minor importance, the greatest cause for variation of vitamin C in the finished product is the variation in the tomatoes themselves from which the juice is prepared

Other fruits are known which contain more ascorbic acid than do tomatoes, for instance, the West Indian cherry has 1,700 milligrams per hundred grams of edible portion [6] However, the extent to which the tomato enters into the American dietary emphasizes the value of the foregoing data It also illustrates the possibility for better national nutrition when the agricultural chemist, the geneticist, the agronomist and the food processor cooperate in producing superior foods

## JAUNDICE FOLLOWING YELLOW FEVER VACCINATION

The epidemiologic relationship between cases of so-called catarrhal jaundice, epidemic hepatitis and post-vaccinal cases has not been clearly elucidated Most observers agree that there is a striking similarity among cases of jaundice occurring in all three types, so that they are difficult to differentiate clinically or pathologically Some vaccines and serums were held responsible for epidemics of jaundice because of the high incidence of jaundice following the use of particular batches and not with others prepared similarly Another suggestive factor is the relative uniformity of the interval between inoculations and the appearance of jaundice A recent study by Freeman [1] offers statistical data to support the thesis that jaundice is a communicable disease

Freeman bases his conclusions on a study of spatial and temporal grouping of cases of jaundice in certain barracks and units at Camp Baker, Fort Belvoir, Virginia The epidemic coincided in time and duration with the large epidemic among American troops during 1942 It was preceded by mass inoculation of troops with yellow fever vaccine prepared by suspending the 17D strain of virus in presumably normal human serum The communicability of epidemic jaundice was sup-

ported by a similar group of cases in units that received mildly "icterogenic" yellow fever vaccine at an earlier period and also by a thirty-six-fold attack rate in the unvaccinated population over the preepidemic rate during the major epidemic The inoculation period ranged from two to four weeks, with a mode and mean of 3 2 weeks, a standard deviation of ± 0 72 and a coefficient of variation of 22 5 per cent The particular yellow fever vaccine used in certain army posts appears to have had the property of predisposing its recipients to the communicable disease referred to as jaundice This property varied in degrees among the se eral lots of yellow fever vaccine The particular mode of transmission of jaundice has not been ascertained, but the common finding of personal association suggested dissemination by droplet or physical passage from hand to mouth Flies may act as mechanical factors Carriers and individuals apparently not infected probably play an important part in the epidemiology of jaundice Freeman stresses that the interval of time between administration of yellow fever vaccine and the epidemic appearance of jaundice should not be referred to as the "incubation period," since it is not directly related to the incubation of an infectious agent He concludes that all cases of jaundice at Camp Baker, whether or not yellow fever vaccine was administered, had a common origin, although proof must await isolation of the etiologic agent and the establishment of a specific diagnostic test

## Current Comment

### ANGINA PECTORIS AND TOBACCO

The term "tobacco angina" has been employed for many years, its importance lies in the concept that smoking tobacco may constrict the coronary arteries and thus adversely affect the heart Recently Pickering and Sanderson [1] studied several patients who developed cardiac pain of an anginal nature following smoking One patient was subjected to many tests and careful studies without evidence being found that smoking produced coronary vasoconstriction, when the patient smoked before or during exercise, tolerance to exercise was not reduced All the evidence, the authors say, was consistent with the view that smoking by this patient was a factor in producing anginal pain because it increased the work of the heart through the pulse rate and blood pressure The use of tobacco, most cardiologists agree, is not the primary cause of coronary sclerosis, which is the pathologic lesion underlying angina pectoris In the patient studied most completely, smoking produced anginal pain only in the period shortly after the disappearance of the pain produced by effort, and this occurred only if the pulse rate rose sufficiently The British investigators believe that their studies provide an alternate hypothesis to the theory that constriction of the coronary arteries by tobacco is the cause of anginal pain precipitated by smoking, namely, that tobacco acts in this respect only by its effect on increasing the work of the heart The investigation further casts doubt on the usefulness of the term "tobacco angina"

### PSYCHIATRIC SELF OBSERVATIONS BY A PSYCHIATRIST

Dr Frederic Wertham [1] reports an analysis of his mental state and his reactions in the course of a grave illness and two operative procedures The sickness was thrombophlebitis of the right leg, with high fever, a general toxic condition and scopolamine anesthesia The doctor was certain that emotional factors did not play a part in his reactions During the first operation, which consisted in ligation of the right femoral vein, his attention was focused on concern with his body He refers to Freud's well known statement that "the sick man withdraws his libido back upon his own ego and sends it forth again when he recovers" In the midst of the operation, during a period when the doctor was either anticipating pain or enduring it, he asked one of the physicians standing near him to find his wife and tell her that everything was going fine This preoccupation must have been strong, he sometimes afterward asked the same thing again although he knew his previous request had been fulfilled This would, in the doctor's opinion, indicate that Freud's formulation is an oversimplification of complicated levels and processes of emotional thinking In the course of the operation the doctor saw a clock on the wall but was unable to read it This particular symptom, known as agnosia, is seen in organic lesions of the occipital lobe such as occurs frequently in carbon monoxide poisoning Probably definite disorders of the higher processes of perception, such as agnosia, may be a component of the disorder of comprehension in scopolamine intoxication In the course of a second operation—ligation of the deep femoral vein in the left leg—the patient experienced what he characterizes as a form of scopolamine psychosis The state was characterized by euphoria, overtalkativeness, general lack of inhibition and euphoric misjudgment of the situation side by side with more or less clear consciousness of apprehension and pain and flashes of insight The doctor stresses the variety in the quality of pain and thinks that this aspect of pain has not been sufficiently appreciated by psychologists and physicians He felt that after this operation he could have enumerated six or eight different kinds of pain, each sharply distinguishable from the other in quality Some of the qualities of the pain were (1) localization, (2) duration, (3) after-image, (4) special qualities of pain, as when a nerve is touched, and (5) association with fear Wertham concludes that from a practical point of view his analysis shows that there are definite and diversified psychiatric aspects of physical disease Medical and surgical patients are in need of psychologic preparation for what they may expect The psychologic features of physical disease are a part of medical and nursing care

# MEDICINE AND THE WAR

## ARMY

### RELEASE CRITERIA FOR ARMY MEDICAL CORPS OFFICERS

Following are changes to War Department regulations that pertain to medical corps officers only

Effective May 1, 1946 the following criteria will govern the separation of medical officers except volunteers and regular army officers Adjusted service rating score sixty or thirty months' active service or 45 years of age to nearest birthday Exceptions are officers in critical specialties, which remain the same as before This category will be separated under the following criteria Adjusted service rating of 60, or length of service thirty-nine months, or 45 years of age to nearest birthday Medical corps officers on becoming eligible or relieved from active duty will be separated or board the fastest possible transportation for return to the United States within sixty days of date of eligibility Medical corps officers surplus to requirement of major commands are returned to zone of interior from overseas within six months of eligibility for release and will be separated under provisions of section 2, circular 290, War Department, 1945

### ARMY OFFERS PAID INTERNSHIPS TO UNIVERSITY MEDICAL STUDENTS

The War Department has announced that junior class medical students now in approved civilian medical schools will be offered internships in U S Army hospitals starting July 1, 1947 These internships will differ from those offered medical school graduates for the ten years prior to the war in that interns selected will be given a reserve commission of first lieutenant in the Army Medical Corps Under the former program interns in army hospitals were classified as civilian War Department personnel at an annual salary of about $1,000

Internships under the present plan will enable the intern to draw the salary of a first lieutenant, or about $3,404 annually if there are dependents If the intern has no dependents he will receive $2,972 a year These figures include rental allowances of about $60 per month which are not paid when government quarters are furnished

Designed to give the fifth or clinical year of training, the course will be of the conventional rotating type This service in approved army hospitals is recognized by the Council on Medical Education and Hospitals of the American Medical Association and state boards of registration which require the clinical year of training before granting a license to practice

"Medical school graduates are assured of an interesting and profitable career in army medicine if they elect to accept Regular Army commissions on completion of the clinical internship in army hospitals" Major Gen Norman T Kirk, the Surgeon General, declared "Selections will be based on scholastic attainment, physical fitness and aptitude for military service We expect to produce outstanding doctors through our educational program'

In notifying deans of accredited medical schools of the plan, the Surgeon General asked that they recommend not only men desirable as interns but men who will ultimately develop as Regular Army medical officers A professional examination will not be required before the internship is accepted

Applications may be submitted by students through the deans of their respective schools They must reach the Office of the Surgeon General between June 5 and June 15 this year Each applicant who successfully qualifies will be notified not later than July 1 He must accept or reject the appointment not later than July 8 Application blanks may be obtained from the deans of medical universities during May

An applicant must conform to the basic requirements of being a United States citizen, a prospective 1947 graduate of a recognized school of medicine approved by the Council on Medical Education and Hospitals, not over 30 years of age on July 1 1947, have no commitments to accept an internship appointment in any other institution and meet physical standards for appointment in the Medical Corps, U S Army Physical qualifications are printed in Army Regulation 40 105

### ARMY AWARDS AND COMMENDATIONS

#### Lieutenant Colonel Andrew R Hicks

Lieut Col Andrew R Hicks, commander of the 180th Medical Battalion, was recently awarded the Bronze Star "for meritorious service in connection with military operations against the enemy from July 10, 1944 to Feb 15, 1945" The citation stated, in part, "During the German counter offensive of December 1944 Lieutenant Colonel Hicks displayed marked professional skill and performed difficult surgical operations for a forty eight hour period When his outfit was captured by the enemy he negotiated for permission to continue operating on seriously wounded American soldiers On his recapture by friendly forces Lieutenant Colonel Hicks planned and supervised the expeditious evacuation of all personnel and patients of his unit" Dr Hicks graduated from the New York Medical College, Flower and Fifth Avenue Hospitals, New York, in 1939 and entered the service June 26, 1941

#### Colonel Joseph E Cox

The Legion of Merit was recently presented to Col Joseph E Cox, Waynesboro, Va., for exceptionally meritorious conduct in the performance of outstanding services in North Africa and Italy from Dec 1, 1943 to May 8 1945 Assigned the mission of converting his 250 bed station hospital into a 500 bed hospital to be used exclusively for the care of neuro psychiatric patients, Colonel Cox demonstrated outstanding ingenuity and professional knowledge in completing this assignment in a superior manner During the year 1944 the new installation created by him was designated as the theater center for neuropsychiatric study, with a School of Military Psychiatry for the training of American medical officers In addition, an extensive series of courses for the instruction of British nurses in neuropsychiatric nursing procedures was successfully completed When, subsequent to the removal of his organization to Italy, it became necessary to divert to it a large number of medical and surgical cases, Colonel Cox promptly adjusted his highly specialized primary function as a neuropsychiatric center Colonel Cox's contribution, both professional and educational to the field of neuropsychiatry despite exigencies of the military situation, which at times rendered his task extremely difficult are deserving of highest praise" Dr Cox graduated from the University of Virginia Department of Medicine, Charlottesville, in 1934 and entered the service March 1, 1941

#### Major Robert C Hunt

The Army Commendation Ribbon was recently awarded to Major Robert C. Hunt, Rochester, N Y, for superior performance of duty as neuropsychiatrist and chief of the consultation service of the command at Camp Wolters, Texas, from Nov 28, 1942 to Jan 9, 1946 "Because of his background of psychiatric knowledge intense interest in human behavior and ability to work with people," said the citation "Major Hunt has been of invaluable assistance to this center The problem of adjustment which confronted all incoming recruits was ever paramount in Major Hunt s mind and his preventive work here has been as great as, if not greater than his curative work This has been of great value to the training program and is responsible for many training hours

saved that would otherwise have been lost. Major Hunt has interviewed and clinically diagnosed over 5 000 cases requiring neuropsychiatric treatment during his assignment here at this center He has had to perform this work almost entirely by himself, competent assistants being lacking He has been of great assistance to all unit commanders in rendering advice, analyzing problems and diagnosing cases of mental behavior before they became extreme and discerning morale trends Major Hunt has been a tireless worker, aggressive yet considerate, loyal, tactful and resourceful He has proved to be a very creative officer with an inquisitive mind and an ability to visualize the need for corrective action plus the added ability to perform that action in a superior manner" Dr Hunt graduated from the University of Pennsylvania School of Medicine Philadelphia, in 1931 and entered the service Sept 28, 1942

### Captain William Kropf

Capt William Kropf, Bronx New York, received a number of decorations, among them the Purple Heart with Cluster, the Arrow Head for first landing on Luzon a Combat Medical Badge and a citation which read "For meritorious achievement in connection with military operations against the enemy at Luzon Philippine Islands, from June 1, 1945 to Aug 15, 1945 In the long sustained rapid advancement through Cagayan Valley with extended supply lines over difficult terrain, Captain Kropf as commanding officer of a medical collecting company provided excellent and uninterrupted medical service. Through the combat, troops were usually deployed over many miles in length Captain Kropf's skilful management, sound judgment and devotion to duty always resulted in speedy evacuation of sick and wounded from every position on the lines His service was an outstanding example of efficiency and exemplified the fine traditions of the Army Medical Corps" Dr Kropf graduated from the New York Medical College, Flower and Fifth Avenue Hospitals New York in 1933 and entered the service September 21, 1942

### Colonel Marcus D Kogel

The Legion of Merit was recently awarded to Col Marcus D Kogel Jamaica N Y "for exceptionally meritorious conduct in the performance of outstanding service as medical inspector, China Theater during the period March 29, 1945 to Nov 1, 1945 Colonel Kogel in a theater of operations noted for its numerous and unique tropical diseases and for its general insanitary condition did by the exercise of his splendid professional knowledge of preventive medicine and the rare judgment, enthusiasm and foresight which he put into his efforts materially lower the health hazards threatening American troops in China By the preparation of practical and appropriate preventive medical directives and by theaterwide inspections after their dissemination he caused the disease rates to be kept to a most satisfactory minimum and saved many United States troops from being ravaged by some of the most formidable diseases known to medical science. A great many American lives were undoubtedly saved as a direct result of Colonel Kogel s untiring efforts in disease prevention He has uniformly carried out his duties in a manner which reflects the highest credit on himself and on the Army of the United States" Dr Kogel graduated from the New York Medical College, Flower and Fifth Avenue Hospitals, New York, in 1927 and entered the service Feb 13, 1941

### Colonel William J McConnell

The Legion of Merit was recently bestowed on Col William J McConnell New York, who as chief of the Industrial Hygiene Branch, Safety and Security Division, Office of the Chief of Ordnance, from October 1942 to October 1945, served in the field of industrial health and hygiene. As a director representative of the Surgeon General, Colonel McConnell was charged with the development and supervision of a comprehensive program to prevent general illness and occupational disease and to promote maximum health and efficiency among civilian employees engaged in ordnance establishments throughout the United States, installations fraught with dangers of various toxic exposures requiring constant surveillance and control The citation accompanying the award called attention to the fact that "Colonel McConnell launched into an aggressive program with unusual energy, foresight, perspicacity and comprehension, successfully reducing disabling illness from toxic explosives to an insignificant level, thereby insuring full utilization of available manpower for ammunition production His cumulative accomplishments reflect great credit on himself and the military service" Dr McConnell graduated from the St Louis University School of Medicine in 1914 and entered the service Aug 28, 1942

### Captain John R Tobey

Capt. John R. Tobey, Newark, N J, was recently awarded the Bronze Star "for meritorious service in connection with military operations against the enemy on Okinawa, R. I, on May 1 and May 25, 1945 In the village of Awacha on May 1, 1945 Captain Tobey voluntarily exposed himself to heavy enemy mortar fire in order to give aid to the wounded. While the aid station was displacing, Captain Tobey received a message that 2 severely wounded men were held in a defiladed position in the village and could not be moved because of the enemy mortar fire With utter disregard for his own safety Captain Tobey went to the wounded men to administer plasma and medical treatment. While he was attending these men 3 more casualties, who were less seriously injured, had worked their way to the position Captain Tobey continued to work until the last of the casualties had been treated and only then did he seek cover Again on May 25, 1945 Captain Tobey moved forward to the vicinity of "Chocolate Drop Hill" near the town of Shuri, voluntarily subjecting himself to intense mortar and artillery fire in order to aid the wounded Because of the nature of the terrain and bad weather it was necessary to make long litter hauls to get the wounded to the aid station Captain Tobey therefore moved up just in rear of the position occupied by Company I so that immediate medical attention could be given before the long litter haul In moving from 1 casualty to another he subjected himself to heavy mortar and artillery fire Captain Tobey's courage and unselfish devotion to duty were an inspiration to all who witnessed his acts" Dr Tobey graduated from the University of Pennsylvania School of Medicine, Philadelphia, in 1940 and entered the service July 28, 1942

### Major Bernard J Mintz

Major Bernard J Mintz, New York, was recently commended by Brig Gen A Hornsby, who said "I wish to commend you for the outstanding manner in which you performed your duties as chief of orthopedic sections at Scott Field, Illinois, from March 17, 1944 to Feb 14 1946 The splendid record and relatively high degree of efficiency of the orthopedic section is largely due to the superior manner in which you fulfilled your assignment. The conscientious and diligent manner in which you performed your duties with the handicap of inexperienced assistants and enlisted personnel is a tribute to your capabilities Assistants and enlisted personnel requiring on-the-spot training were frequently transferred so that the responsibility of surgical treatment, administration and the performing of detailed tasks evolved on you Another commendable example of your work was the organization development and supervision of the physical therapy department, which has treated an average of 3,000 patients monthly since its development In view of these accomplishments and your subsequent honorable service, you are hereby authorized to wear the Army Commendation Ribbon by direction of the Secretary of War, in accordance with W D Circular 377, dated Dec. 18, 1945" Dr Mintz graduated from the Boston University School of Medicine in 1929 and entered the service May 26, 1942

### Major Harry R Chinigo

The Air Medal was recently awarded to Major Harry R Chinigo formerly of Flushing N Y, and he has been recommended for the Oak Leaf Cluster Dr Chinigo graduated from New York Medical College Flower and Fifth Avenue Hospitals, New York, in 1937 and entered the service August 6 1942

# NAVY

## BUREAU OF AGRICULTURE DEPARTMENT COMMENDED

The Bureau of Entomology and Plant Quarantine of the Department of Agriculture was recently commended by Secretary of the Navy James Forrestal and Vice Admiral Ross T McIntire, Surgeon General of the Navy for research conducted in the development of insect and mite repellents

In a letter to the Secretary of Agriculture Secretary Forrestal stated that the Bureau of Entomology and Plant Quarantine 'rendered a fundamental and outstanding contribution to naval forces which has changed the entire methodology in the control of insect borne diseases

Vice Admiral McIntire in letters of commendation to Dr P N Annand, chief of the bureau and thirty-two of his associates, said that the immediate recognition of the great military potentialities of insecticides, such as DDT aerosols, insect repellents and protective fabrics resulted in their conversion to maximal efficiency for military use.

The close cooperation and assistance rendered the Navy by the Bureau of Entomology and Plant Quarantine were in a large measure responsible for the successful development of the repellents which made it possible to carry on our military campaigns in tropical areas with a freedom from disease formerly thought impossible, the Surgeon General pointed out

## UNIVERSITY OF WISCONSIN MEDICAL SCHOOL CITED

A certificate citing the University of Wisconsin Medical School, Madison, for effective cooperation in the training of naval officer candidates was recently accepted by Dean Walter J Meek in a ceremony held in the campus naval base office The citation, signed by Secretary of the Navy James V Forrestal is "for effective cooperation with the United States Navy in the training of officer candidates in the Naval V-12 Program during World War II"

## NAVY AWARDS AND COMMENDATIONS

### Commodore Don S Knowlton

A Gold Star in lieu of a second Legion of Merit was recently awarded to Commodore Don S Knowlton, Washington, D C 'for exceptionally meritorious conduct in the performance of outstanding services as division surgeon of a Marine infantry division during the planning for and conduct of operations against the Japanese enemy on Okinawa Shima Ryukyu Islands, during the period from April 1 to June 21 1945" The citation accompanying the award stated that during the preparatory phase of the operation "Captain Knowlton with untiring efforts, supervised the organization and training of the medical battalion within the division With keen technical skill and professional ability he trained his command to a high state of readiness for amphibious operations During the assault phase of the operation the medical companies under his direction kept constantly in contact with the advancing front line troops, offering prompt and efficient medical aid and surgical treatment to those wounded or injured in action The ability of the individual corpsman the capabilities of the unit medical officers, the efficiency of the medical organization, the promptness of the evacuation of wounded all attested to his brilliant leadership Throughout the entire operation he demonstrated an extremely high degree of professional knowledge both as a member of the medical profession and as a naval officer He kept constantly in touch with the rapidly changing tactical situation so that he might better employ the men of his command His sound judgment, both tactically and medically his inspiring leadership and his intense devotion to duty were ever an inspiration to the men of the division and aided materially in the furtherance of the operation His actions throughout were in keeping with the highest traditions of the United States Naval Service." Dr Knowlton graduated from Tufts College Medical School Boston in 1921 and has been active in the Naval Reserve for twenty-seven years

### Commander Richmond J Beck

Lieut Comdr Richmond J Beck, Huntington L I, N Y, was recently commended 'for distinguished service in the line of his profession as psychiatrist and embarkation debarkation officer aboard the U S S *Solace* from November 1943 to July 1945 During this period he displayed professional skill and ability, demonstrating outstanding zeal and steadfast devotion to duty in his handling of casualties evacuated from beachheads He exhibited a high degree of physical fortitude and endurance in expert treatment of the wounded and was directly responsible for saving the lives of many men suffering from shock and other combat disabilities His personal attention to detail and leadership were an ever present source of inspiration His services and conduct throughout were in keeping with the highest traditions of the United States Naval Service Dr Beck graduated from George Washington University School of Medicine, Washington, D C, in 1921 and entered the service Oct 24, 1942

# MISCELLANEOUS

## HOSPITALS NEEDING INTERNS AND RESIDENTS

### Hearings on S 1606—To Provide for a National Health Program

(NOTE.—*This is a condensation of the verbatim report of the hearings*—ED.)

*(Continued from page 47)*

United States Senate, Committee on Education and Labor

APRIL 16, 1946

HONORABLE JAMES E MURRAY Presiding

PRESENT Senators Murray, Pepper, Tunnell Smith and Donnell

#### Statement of Dr R L Sensenich, Chairman of the Board of Trustees, American Medical Association

DR. SENSENICH I have prepared Senator Murray in the interests of your committee, the members of which I know are very busy, a statement which I will ask be placed in the record The statement has frequently been made that the action of the American Medical Association represents only a small group a portion only of the Association, and it has variously and ungraciously been referred to as a clique, and comment has been made that it does not represent the attitude of the American medical profession

SENATOR MURRAY At the outset I would wish to say that the committee does not recognize that at all and we recognize the American Medical Association as representing the profession in this country almost completely and we are satisfied with that fact.

DR. SENSENICH I wish to state that the membership of the Association exceeds 125,000 physicians and that its policies are determined by its House of Delegates which numbers 175 This group is elected by the various state societies and the representatives to the state organizations are from the county and local component societies So that we do make the effort to have—

SENATOR PEPPER I do not like to interrupt you Doctor except that you were speaking about the organization of the American Medical Association. DR SENSENICH Yes sir

SENATOR PEPPER You say it starts with the county association? DR. SENSENICH That is right

SENATOR PEPPER And the next is the state association? DR. SENSENICH Yes, sir, Senator

SENATOR PEPPER And the next is the national House of Delegates, composed of representatives of the state associations? DR SENSENICH That is right, sir

SENATOR PEPPER Now, I was interested in the parliamentary procedure which prevails in the organization Suppose that a county medical society we will say in my county in Florida desires to come out in favor of a particular form of health insurance and they pass a resolution to that effect, in my county in Florida, that is the county medical association How long would it take before that resolution of this county medical association would come before the House of Delegates in the regular order? DR. SENSENICH That resolution might come first to the state House of Delegates the state association and from that group to the House of Delegates of the American Medical Association However there would be nothing preventing that county society from directly approaching a delegate to the House of Delegates of the American Medical Association and presenting to it this resolution or this action of the local component society

SENATOR PEPPER I got the impression from somebody and I wanted you to advise me about the accuracy of the impression that it took something like three years to get a matter of that sort finally before the House of Delegates and to get its decision on it. DR SENSENICH I am glad to discuss that, Senator Pepper, because the House of Delegates in each state meets at least annually, and on special occasions it may have extra sessions At the present time, there is much discussion as to the advisability of meeting regularly two times a year, but we are subject to call at any time

SENATOR PEPPER There is no rule about any length of time that has to elapse and there is no executive committee that has to give final approval of it? DR SENSENICH There is no screening there is nothing to prevent or even discourage any county society from taking any action that it wishes, and that action may then be taken to the governing body of the American Medical Association SENATOR PEPPER All right

SENATOR DONNELL May I ask the Doctor one question too at this time? Doctor, what proportion in percentage would you say the 125 000 physicians who are members of the American Medical Association represent with respect to the entire practicing profession of medicine and surgery in this country? DR SENSENICH There are probably as many as 50 000 or 60,000 graduate physicians that are not members of the American Medical Association Now, as to how many of them are actually in practice it is impossible to say There are men who graduate and then take executive positions in various life insurance companies or in this or that group but there is this number who are of themselves independent and are licensed to practice, and who can as frequently as they wish express their wishes and their ideas and their positions on medical matters

*(Dr Sensenich presented the action of the House of Delegates on the bill S 1606)*

SENATOR TUNNELL Could you tell us about the countries where this has been tried? Positive proof exists from experience in other countries you say, that inferior medical service results from compulsory health insurance DR SENSENICH I have visited Germany France and England and have had some opportunity to observe the operation of the plans However, I should prefer if you will Senator that you would wait until a little later, when Dr Walter Kennedy will go into that in detail SENATOR TUNNELL All right.

DR SENSENICH On page 4 of the brief there is the National Health Ten Point Program of the American Medical Association It is to be regretted that for some reason or other this action of the American Medical Association and the effort that has preceded this statement of program, throughout many, many years, has not received the general recognition to which it is entitled Too often the American Medical Association has been charged with being obstructionist and not in any way willing to accept any innovations or any changes in the matter of the provision of medical care

The American Medical Association urges a minimum standard of nutrition, housing clothing and recreation fundamental to good health The responsibility for the attainment of this standard should be placed as far as possible on the individual but the application of community effort compatible with the maintenance of free enterprise should be encouraged by governmental aid where needed. That is the background of the position that the American Medical Association has taken with reference to the Hill-Burton bill and other legislation which is pending

SENATOR PEPPER You would not think it would be socialistic for the federal government to aid in maintaining minimum standards of nutrition, housing clothing, recreation and so forth? DR SENSENICH No, I think not, if there is need and the community is unable to do that for itself I think Senator Pepper, that I believe your legislative efforts have been directed toward improving general standards of living Now,

of course, the manner in which that shall be attained is the point which determines whether or not it is socialistic or what it is The child should have throughout infancy proper attention, including scientific nutrition and immunization.

SENATOR PEPPER You say that you would like to see every mother and child get the care that they should have? DR. SENSENICH Yes, sir

SENATOR PEPPER And that would carry with it the provision of hospital care for every mother at childbirth? DR SENSENICH I think so, sir

SENATOR PEPPER And prenatal care also for the mother and the child? DR. SENSENICH Yes sir

SENATOR PEPPER And then the necessary care that the child should have after birth, in its health? DR SENSENICH Yes sir

SENATOR PEPPER And you would recommend that whenever a mother is not financially able to purchase the needed medical and hospital care in such cases the government could properly and should properly make those things available to them? DR SENSENICH Yes sir, however, I should distinguish there Senator Pepper, as between the local government and local units and the federal government. I should dislike to have that made the basis of an overall governmental policy which disregarded the responsibility locally, from the individual on up

SENATOR PEPPER Obviously there would have to be some more hospitals built to give that much care to the mothers and children DR SENSENICH Yes sir

SENATOR PEPPER And probably some more physicians and nurses and so on? DR SENSENICH But that should be determined on the local need That is the point which has been developed.

SENATOR PEPPER And you think the local government could afford all of that needed service without federal aid? DR. SENSENICH In most instances it could Out in my own city I happened to pick up the statement of the board of health for last year, and out of some 2,600 and some births there were only 20 that did not take place in a hospital and that is a mixed population, including Negroes and foreign and industrial elements

SENATOR MURRAY Are you familiar with the conditions in poorer states, in the South Doctor, where they claim that they have not the means to build and maintain hospitals even if the hospital was built by the federal government, and they would not be able to maintain it and support it through lack of sufficient means? DR. SENSENICH I think that that is no doubt true in areas Of course, Senator Murray we must not lose sight of the fact that there are other things which will enter into the situation outside the actual construction of hospitals You cannot have a community in good health that is not decently fed and clothed and cared for The attitude of the American Medical Association and the physicians locally has always been that the need should be determined. Many communities that now do not have hospitals are ready and not only ready but actually have built up funds looking toward their contribution in part at least to the creation of local medical facilities

SENATOR PEPPER Taking the country as a whole what percentage of the children are born in hospitals do you recall? DR. SENSENICH I do not have that We will have later in the day some statistics from Dr Joseph Howard, who was to have appeared on this program and unfortunately became ill

SENATOR PEPPER You say that you have not lost faith in the individual That does not mean that all doctors render service on credit however, does it? DR. SENSENICH I do not know of any

SENATOR PEPPER There are a lot of poor people that have told me that they do not get a doctor if they do not pay the cash on the barrel head when he comes to render the service DR. SENSENICH That I could not argue because I do not know all of your doctors I would only insist on this and I think that you would agree to it Senator Pepper, that after all that is not the attitude of most physicians

SENATOR PEPPER I think a lot of this charity service that is talked about is a lot of hooey and I think a lot of poor people can prove it.

SENATOR DONNELL I would like to be recorded as supplementing what Senator Pepper has said A good deal of talk about charity is the exact fact, because I have a profound respect for the charity and generosity of the medical profession. There may be instances to which the Senator refers in which he is quite correct, but my observation has been, and my view is that the medical profession has been characterized by generosity and charity

SENATOR SMITH I would like to record the same view I just heard this as I came in I want to protest against the suggestion anywhere in these hearings that the medical profession has not been a profession of out-giving service to the people of this country I lived in a medical atmosphere from my childhood up, and I have been inspired all of my life by what the doctors have done for the people That does not mean that there are not big gaps to be filled, but I do not like the suggestion that the doctors, as a whole, have not had the spirit of giving to the people of this country

SENATOR TUNNELL I do not see how they live if they do *not collect, that is a practical side of it.*

SENATOR MURRAY I think we are all in accord that the medical profession has been most generous and charitable but at the same time there is a limit beyond which it would be impossible to expect the medical profession to furnish medical care, proper medical care and hospitalization to people in various sections of the country There is no doubt about that. I think that the doctors would be willing to do what they could, but they simply cannot handle the whole problem and it would be unfair to ask them, because the average income of the medical profession is pretty low There are some parts of the country where they do not make enough money to continue in practice, and they have to leave there I know of cases of that kind So that you cannot expect a doctor to raise a family and maintain his family in a community where he cannot make a living and that situation exists, there is no doubt about that. That is no reflection on the medical profession at all

SENATOR PEPPER I would like to say by way of clarification of my remark that I happen to have been delivered by an old country doctor, and in my youth on a little Alabama farm I had a chance to see the character of the country doctor, and as I grew up later I had a chance to see the family doctor, who is the typical doctor in the American mind, but I have also seen as I have grown older and talked to more people and I have heard more pathetic cases of where the specialization and the general commercial tendency that has invaded all of our life and the demands of the doctor of course, for his own survival, have made it more and more common for the doctor not to come unless he knows he is going to get a fee for coming to visit the patient.

I have been in the homes of too many Negro servants that have worked in my house and I have talked to too many others, to have them tell me that the doctor will not come unless he knows he is going to get the cash to take home with him when he makes his visit.

Now, as Senator Murray has said, I am not complaining about that, and I do not think that he owes medical service free to the community any more than the lawyer or the merchant owes it to give his goods to the humble I do not think it is the problem of the grocer in a community to feed the hungry of the community If the hungry exist it is the community's obligation to feed them if they are needy What this bill proposes is to take the individual out of the ranks of charity so that it will not be a beneficence if the doctor comes to see him but to make it possible for the poor to provide in an honorable way for their medical and hospital care. But when time and again the proposition is made, in opposition to legislation like this, that the poor of this country can get medical care by charity, the statistics do not bear it out.

DR SENSENICH Senator Pepper, if I may ask you a question how would you provide for this low-income group other than on a charity basis, if the income is insufficient to pay its reasonable proportion of the premium?

SENATOR PEPPER I think the Wagner-Murray-Dingell bill would be the foundation of the answer to your question, and that would cover everybody who is in the payroll class and they would pay probably a certain percentage of their payroll and the employer would pay a certain percentage of his payroll, just as they do now in respect to unemployment compensation, and then those who were not employed, so that they could not pay through the payroll tax as this bill eventually contemplates, then they would be provided for by grants of federal funds and those grants would be contributed by the federal and the state and the local governments in my opinion if you were to make the proper arrangement

And it is certainly not socialized medicine and it is not as you suggest here, anything that is sinister in character for a

person to have an opportunity through a cooperative insurance system to provide in an honorable way for his own care, without being the beneficiary of charity

DR SENSENICH The reason for discussing the matter of the Wagner-Murray-Dingell insurance provisions is with reference to the low-income group One of them is that the insurance is not cheap from the estimates Of course I admit that there are no figures that have been given but taking from the testimony of Mr Altmeyer, if the individual even of a low-income family, with three earners, would contribute 3 times 27, or 81, and 3 earners it is no small contribution

SENATOR PEPPER You will admit that the more people in the system, the cheaper it will be is that not a fact actually? DR SENSENICH It should be, yes, sir

SENATOR PEPPER And the only way you can get the price down so that the low income group of people can participate is to have the largest possible number of people in the system is it not? DR SENSENICH Yes, sir

SENATOR PEPPER And the fewer the people in the system the higher the rate will have to be is that not true? DR SENSENICH It depends

SENATOR PEPPER Is not one of the basic principles of this compulsory insurance to bring in by public requirement the largest number of people so that we will have the lowest possible rate for the people who participate on ordinary actuarial principles? DR SENSENICH The point in question there Senator Pepper, and I think you and I have discussed this at other times is the fact that there is a tremendous concentration of poor insurance risks in this lower group which means that the rest of the contributors to the insurance fund will pay out of proportion to their own risk in order to support a very large number of those who are not good risks

SENATOR MURRAY Are you discussing a voluntary system?

DR. SENSENICH I am discussing any system in which you introduce into the picture a low-pay risk that goes in bad health and who will continue to contribute $27 a year and will be under continuous medical care and support, because the burden of that falls on the others

SENATOR PEPPER Have you not disclosed the real weakness of the voluntary plans? Just as I say the major risk is among the poorest category of the people DR SENSENICH They are not risks they are burdens

SENATOR PEPPER I mean the poorest health risk. The greatest health needs are among the people of the lowest income groups DR. SENSENICH That is right.

SENATOR PEPPER Now then, they are a burden as you say if you put them into a system, so is it not the tendency of the voluntary plans, in order to avoid that burden some category of the poorest of the poor, to attract primarily those in the upper income groups who are the best health risks? That emphasizes the very inherent weakness and failure of the voluntary plan. That leaves all of the people at the bottom of the ladder who need health care most, with the least ability to provide so this compulsory insurance plan budgets them all in together, and yes it does make the well-to-do and it makes those who need health care least come into the same system with those who are least able to pay and need the most. But is not that the only way that you are going to make it possible for those who need the most and are least able to pay to get adequate care? DR SENSENICH Senator Pepper the individual who does not have sufficient income and this very low group that you refer to should not and cannot properly be included in any insurance plan and we have advocated for all time that they should be properly taken care of In your own area, Senator Pepper, you discussed a moment ago the individual who could not receive medical care because he did not have funds Actually that reflects on the local government which should provide for every one who is unable to secure otherwise, but they are not properly an insurance plan

SENATOR PEPPER Is not public education on the same basis? There have always been throughout history a few healthy or well-to-do people who could send their children to private schools and have tutors in their homes with you that would have closed the doors of public education to the masses of the people I remember when I was a boy still hearing a lot of well-to-do people complain about having to pay to educate their neighbors' children, as they would have the power to do in the case of their own children

Yet we live in a democracy here, where we say not only the rich man who could educate his own child by tutor or in a private school, but the man who has no children shall pay according to his ability to pay to educate the children of America And I do not see any difference between that principle and the principle of compulsory insurance where we bring in those most able to pay, and those least needy of health care into a national insurance scheme so that the poor will be able to get not only education but health care

DR SENSENICH The condition is not comparable because the people in the school require a comparable amount of care and education and expense whereas the group that we are talking about who are continuously sick are not on the same basis, comparable with the other individuals

SENATOR PEPPER The bachelor who has no children at all he does not have any children to get the same amount of care, and yet he pays taxes on it

SENATOR MURRAY When you say "the group that are continuously sick," what do you mean by that? You do not mean that they are sick all of the time? DR SENSENICH Virtually so, there are many who are chronically ill

SENATOR MURRAY There are many yes sir I know

DR SENSENICH And those individuals they are the recipients of charity when you make public contribution to a fund or they are the recipients of charity contributed by other members of the same insurance plan if they are not fair and average risks

SENATOR MURRAY But we have a vast segment of our population that are not as poor as you indicate this group who are continually sick, that cannot afford the modern costly medical care and hospitalization, is that not true? DR SENSENICH Yes, in that case

SENATOR MURRAY You would not want to put them on the basis of having to accept charity, and to be classified as charity cases? DR SENSENICH Is the charity any different Senator Murray, to those individuals than it is to the money that you contribute to the care of crippled children or for rehabilitation or for any of the other special funds that are set up for individuals?

SENATOR MURRAY Yes I do I think that we have people in this country who are employed and working and raising good families and they should not be put in the position of having to be classified as paupers and unable to get proper medical care. I think that there should be some way of bringing that adequate medical care within their reach so that they can maintain their dignity as American citizens and I think if you will investigate as our subcommittee has investigated you will find that in a great majority of the cases where people do become perpetual paupers they started on that road through illness in their family and through debts which were accumulated as a result of their efforts to take care of themselves DR SENSENICH There are a great many who are mentally deficient and who never could get on well in competition with the average, normal individual There are many factors that enter into that and I think that we can state this definitely and all agree on it That we are all seeking as an objective the best medical care for every one and we are now discussing the means of accomplishing it, and it seems that it is hardly fair to include the entire group of individuals the entire population in a plan that will in the end bring about a lowering of standard and deterioration of service in order to take care of a smaller group to whom we feel that whatever assistance is given them should be given in a manner not recognizable

SENATOR PEPPER You do not mean that the people who need the most and are least able to pay it are the smallest group? There are more of those people than there are the well-to-do people DR. SENSENICH It depends on what you mean by well-to-do

SENATOR PEPPER What do you consider it? How much income do you think a family head should have a year in order to purchase the kind of medical and hospital care that would be available to the beneficiaries under this Wagner-Murray-Dingell bill? DR SENSENICH Senator may I answer that this way I recall when that statement came out purely on a matter of income. Let us be realistic and see the other side

SENATOR PEPPER I think that you would not mind giving me an answer to that What income for the head of a family would be necessary in order to purchase for that family the medical care that would be available under the Wagner-Murray-Dingell bill to the persons covered? DR. SENSENICH May I answer that in this way that income buys varying quantities of service in various communities, and that after all I must insist that you have to look at the reality and not the idea

Now then we must say on the other hand that no nation in the world—and may I answer this way Senator Murray

SENATOR PEPPER Senator Murray is going to get mad at me if you keep calling me by his name

SENATOR MURRAY That will all go in the record in my name and I will get credit for it and he is getting jealous of it.

DR SENSENICH We have to be realistic and recognize that, after all the major portion by far of the American population and I mean the population of the United States have had sufficient funds to get good medical care and they have enjoyed a better standard of health than any other country in the world

SENATOR PEPPER Now, you do not mean to say Doctor that the majority of the American people have been able to buy in the past the medical and hospital care that they ought to have, do you? DR. SENSENICH They have had enough to be well.

SENATOR PEPPER Do you think the American people have all been well? DR. SENSENICH Yes I know that they have

SENATOR PEPPER Very well Now how about my figure I wanted to ask you how much income you think the head of a family should have to have in order to buy in the private channels that are existing today the kind of hospital and medical care which is extended to the people covered by the Wagner-Murray-Dingell bill? DR SENSENICH There is no figure available

SENATOR PEPPER What is your opinion of the figure? DR SENSENICH The one that is quoted and I could not off-hand say It would be foolish for me to make an estimate. That should be studied.

SENATOR PEPPER Could they buy it on $500 a year? DR SENSENICH Of course not

SENATOR PEPPER $1,000 a year? DR SENSENICH In some areas, they not only can, but do and have, but I personally think that that is not enough

SENATOR PEPPER You think if the head of a family has an income of $1,000 a year that he can buy in any community in America the kind of hospital and medical care that this bill would provide to the covered people? DR SENSENICH When those figures came out, Senator Pepper, as a matter of fact they included a number of people who live on small farms and derive almost all of their living off the farms

SENATOR PEPPER They do not derive their hospital and medical care off the farm, they do not grow that, do they? DR. SENSENICH No but they are not always in need of that much medical care They may have their money available for that service to a much greater degree than the other individual that is on a salary

SENATOR PEPPER If they need hospital care and medical care of a sick child or sick mother or sick man in the country as distinguished from the town or the city is there a difference in that? DR SENSENICH There is a difference in charges but that is not the point if the individual has $1 000 to spend on those things his money on the side, obviously he can buy service that the individual in the city cannot buy if that is his total income, and he has to pay rent and other things There is no figure on that available which determines exactly what is necessary and could be determined only over a study of years and the average incidence of illness confining it to those individuals

SENATOR TUNNELL I would like to ask a question here. As I understand your position, Doctor you admit that there is an obligation somewhere and you place it on the local community? DR SENSENICH That is possible, yes sir

SENATOR TUNNELL I was protesting that it was not the duty of the doctor, I do not think the physician has the obligation to look after the health necessities of a community free. DR. SENSENICH That is right

SENATOR TUNNELL That is too much of a burden. DR SENSENICH That is right.

SENATOR TUNNELL It is just a case of where that obligation is DR. SENSENICH That is right Finally the House of Delegates in December of 1945, acting on several resolutions adopted a resolution setting up the machinery of coordinating and developing to a greater degree the voluntary insurance plans in the various states, and that is incorporated in this report.

SENATOR MURRAY Your judgment is Doctor that all of the proper medical care and service can be obtained by the American people through these voluntary systems that you have mentioned? DR SENSENICH What is that, all that need it? SENATOR MURRAY Yes sir DR. SENSENICH There are some who will never be incorporated in those plans

SENATOR MURRAY How many will be incorporated in those plans? DR. SENSENICH That I cannot say they have not had a sufficient time to develop

SENATOR MURRAY The American Medical Association always opposed those plans in the past? DR SENSENICH No they have favored them for some years past, on an experimental basis but there has been no actuarial experience and it would be folly to have promoted or encouraged the establishment of a great many plans that would ultimately fail because there was not sufficient actuarial experience.

SENATOR MURRAY Would it not be impossible at any time to develop these voluntary systems to such a degree that they would be capable of furnishing proper and complete medical care and hospitalization to the people of this country I mean to say outside of those who are in the indigent classes who are unable to contribute anything? DR. SENSENICH Well in fact, not every one would subscribe to any kind of insurance, and not every one whom you included in the compulsory plan would utilize the service that was obtainable under that plan Just as long as you have individuals and a free government of course they will do as they like However a sufficient amount of education would stimulate interest

Now we are the most insured nation in the world I think that we have some 80 million people covered by some kind of insurance There is nothing like it anywhere, and with a little encouragement and more facilities available there is no question that that would grow and continue to grow However there would be some who would not be included, but after all we cannot control every individual

SENATOR MURRAY But these plans do not give adequate coverage in the way of medical care and hospitalization For instance would you describe some of the medical plans that you know of which you believe would be complete as an answer to this question? DR. SENSENICH Some of the plans cover catastrophic illnesses only and surgery

SENATOR MURRAY Give me the name of some of them DR SENSENICH I cannot give that off-hand, I would be glad to furnish that for the record

SENATOR MURRAY Well, you are familiar with the Michigan Medical Service? DR SENSENICH Yes sir, you have a report on that

SENATOR MURRAY How does that compare with the coverage of the Murray-Wagner-Dingell bill? DR. SENSENICH It does not include as much as the Murray-Wagner-Dingell bill

SENATOR MURRAY It only provides surgical care and a partial maternity care. DR SENSENICH And also partial medical care, as I understand it. However, there are areas in which the plans cover everything

SENATOR MURRAY I do not understand that it gives anything except the surgical care and the partial medical care DR SENSENICH There are some of the plans Senator Murray that cover hospitalized illnesses and some others in which they are extending the service out to calls in the home. And there are some of those that are not included in these voluntary plans, but there are commercial plans that pay for service in the homes

SENATOR MURRAY But none of them cover complete service such as the bill before us? DR. SENSENICH Not at this time, sir

SENATOR MURRAY. And all of them have qualifications which make it available only to selected groups people of selected groups? DR. SENSENICH They were dependent in their early experience, while they were attaining some actuarial knowledge on some kind of selection and therefore they had to limit it to people who were employed Assuming the fact that they were employed meant some reasonable measure of health and so on Those things have all obtained, but they are expanding now as their information increases

SENATOR MURRAY But none of them are getting away from those restrictions which were mentioned here? DR. SENSENICH Yes they are.

SENATOR MURRAY My understanding is that most or all of these voluntary plans have restrictions Some will not enroll persons above or below a specified age or persons not enrolled in groups, or persons above a specified income, and some are limited to particular occupational or other groups and then the services are all limited, so that a person might be insured in one of those organizations for years and yet when he suffers a severe illness he would not get any benefit, because the coverage is so narrow in scope that he would not be able to take advantage of his position as a member of one of those groups DR. SENSENICH That is all in process of develop

ment, Senator Murray If you turn back to page 10 of my report, if you wish, there are certain standards of acceptance for medical care plans, and they will be encouraged

SENATOR MURRAY What page is that? DR SENSENICH Page 10 Senator Murray It goes into the matter of provision to the subscriber in the contracts and they are all operating under state law They must be financially dependable and as time goes on and experience and funds permit, the benefits are increased to cover additional risks and additional time of hospitalization and so on

SENATOR PEPPER Is it not a fact following Senator Murray's inquiry, that only about 3 per cent of the people of the country are given under the voluntary plans, anything like the comprehensive coverage that the Wagner-Murray-Dingell bill would extend? DR. SENSENICH I cannot give you at the moment the exact percentage, I can give you that later I will be glad to give that to the committee

*(Senator Pepper questioned Dr Sensenich as to the minimum income necessitating medical charity)*

SENATOR PEPPER I have some statistics which show that in the family income group from nothing to $449, 6 9 per cent get any kind of charity in respect to health care, whereas 13 9 per cent of rural non-farm people get some charity and medical care in that group and 17 3 per cent in the cities Practically only one third as many people in the country in that income group get any kind of charity in the medical field as get it in the urban areas In all of the categories under $3 000 a year in a group that was examined 6 4 per cent got any kind of charity medical care dental or otherwise and 12 5 per cent in the other areas got some kind of charity So that that shows that it is very probable that relatively few of the people who needed medical care and were unable to pay for it got it by charity DR SENSENICH But, Senator Pepper you are assuming the probability that they needed the care. As a matter of fact we explored, some years ago, a number of those areas and found much to our surprise, that even though they had no charity and they had very small incomes, they enjoyed very good health and their incidence of impairment was no greater than it was in urban communities with plenty of facilities available.

SENATOR PEPPER Your position is that the people of the United States need relatively more hospital and medical care than they are now getting? DR. SENSENICH In many areas it is true, and in many areas they need a great deal

SENATOR PEPPER What about the areas where it is not true?

SENATOR DONNELL Would you pardon me just a moment, may I make a point of order Mr Chairman, with respect fully to the Senator and to the Chairman, I think the Doctor should be permitted to answer the question fully without interruption, and I know the Senator from Florida admits that, too

SENATOR PEPPER Had you finished that yet? I wanted to ask you about the many areas in which it is not true.

DR. SENSENICH Then provision should be made, first of all, with facilities, and secondly, it should be determined what they need, and if they need medical men, and then the means to be provided. The thing that I do not like—I mean the profession generally that is, not myself, I feel that way myself and the rest of the profession—that the entire population should not be regimented into a plan simply to care for a relatively much smaller group Now, I realize that you will say there are more than I say there are, and the best information available is the factual data which we had back here in 1940 which was a much more extensive survey than anyone else had made.

SENATOR MURRAY What did that show generally without going into detail? DR SENSENICH I really cannot answer the question without going into some detail

SENATOR MURRAY It showed there were good health conditions? DR SENSENICH Yes

SENATOR MURRAY How does that correspond with the reports of the Selective Service Commission which found that as a result of ill health and defective conditions, that 40 per cent of the boys examined had to be rejected? DR. SENSENICH Senator Murray, we have a witness following me, Dr Goin, who will go into detail on the draft situation

SENATOR MURRAY I merely wanted to point that out now, because that is in conflict with the statement that you just made. DR SENSENICH The assumption of 40 per cent is subject to considerable variation and also some correction, and if you will permit, we will have Dr Goin tell you about that later

SENATOR PEPPER If you will permit me to call attention to some of the disclosures of our subcommittee's report

In fact, more than 23,000 000 people in the country have some chronic disease or physical impairment On any one day, at least 7 000 000 people in the United States are incapacitated by sickness or other disability half of them for 6 months or more Illness and accidents cause the average industrial worker to lose about 12 days from production a year a loss of about 400 000 000 man-days annually Sickness and accidents cost the Nation at least $8 000 000,000 a year—half of this amount in wage loss and half in medical costs

Preventive services are inadequate—40 per cent of our counties do not have even a full time local public health officer Sanitation needs are great—846,000 rural homes do not have so much as even an outdoor privy Hospitals are needed—40 per cent of our counties with an aggregate population of 15 000,000 do not have a single recognized general hospital Doctor shortages are severe—in 1944 553 counties had less than 1 active physician per 3 000 population the danger line and 81 had no active doctor at all Even in 1940, before many doctors were drawn off to war 309 counties had less than 1 active physician for every 3,000 people and 37 had no active doctor at all Maternal and child health services are inadequate—it is estimated that half the maternal and a third of the infant deaths could be prevented if known measures were fully applied Seventy five per cent of our rural counties have no prenatal or well baby clinics at all under the supervision of State health departments State agencies had 15 000 children on their lists awaiting crippled children s care in early 1944 They do not even pretend to care for the half-million children with rheumatic fever (the most killing of all diseases for children between ages 5 and 15) or for the tens of thousands of cerebral palsy (spastic paralysis') victims

It was our opinion that the people of the United States are not getting the medical care that they should be getting

DR SENSENICH That involves a good many things which will be covered by witnesses later, with reference to the distribution of hospitals and charity

SENATOR MURRAY You are not prepared to discuss with us the medical service plans that we have mentioned here? You have not made an exhaustive study of the different plans for prepaid medical care, that are being advocated?

DR SENSENICH We have a statement here from the director of our prepayment plan insurance group, and if I may have permission to have it included in the record, and that copy will be available to you

SENATOR MURRAY Will he appear here for cross examination? DR SENSENICH He is not able to

SENATOR MURRAY We would like to, if we could discuss with someone representing your profession the voluntary plans that are proposed and which you say are being developed. We think that it will be impossible to ever develop them to the degree that we will have a system that will furnish the American people with adequate modern medical care and hospitalization

SENATOR DONNELL I take it that the chairman does not mean to be expressing the opinion of all of the members of our committee in that statement. I say that with all due respect I realize the chairman is of that opinion but the committee itself has not yet passed on that question.

SENATOR MURRAY I am modifying it to that extent, but I am satisfied that when they hear the evidence they will recognize it

SENATOR DONNELL I mean no discourtesy to the chairman in the slightest, but the committee has not acted on that question

SENATOR MURRAY But I am satisfied when the committee hears all of the evidence, that they will agree with me, that it is impossible under any voluntary system in the United States to furnish the American people with a system of prepaid medical care and hospitalization. I am so convinced of that that I was led into the mistake of including all of the members of the committee, in support of the statement, and I will withdraw it now, and merely say that that is my judgment, and that is the judgment I think of every one who has made a study of these plans, and I am sure the testimony will convince you.

DR. SENSENICH It was not possible to present a witness on all of these phases, in the time allotted to us

SENATOR MURRAY It seems to me that this is the most important phase. It seems to me someone from the American Medical Association should come here prepared to convince the committee that we can take care of this problem in the United States by a voluntary system. I do not know of anything more important than that, that somebody should come here to show us that the system which we propose is wrong

DR. SENSENICH If the chairman will permit we have three other witnesses One will deal especially with the matter of statistics as to need. We think first of all need is the most important thing to discuss The second will deal with the hos-

pitals and medical facilities, and the third will deal with operations of plans of this type, and we have added the record from the head of our department of prepayment insurance, for a part of your record also, and may I say at this time that we will be happy to assist the committee in any way that we can in the consideration of the legislation

SENATOR DONNELL May I ask the doctor just a few questions, please? Doctor, I take it that all parties, physicians and laymen as well, generally realize the importance of improving health conditions to as practicable an extent as possible That is correct, is it not? DR. SENSENICH Yes sir

SENATOR DONNELL And the American Medical Association has been keenly alive to that problem, has it not? DR SENSENICH That is right

SENATOR DONNELL And as pointed out in your statement at page 6 at a meeting of the House of Delegates of the American Medical Association held in Chicago December 3 to 5 of last year the House of Delegates made a report a paragraph of which is quoted in your report as follows

"All of these plans"—that is, referring to voluntary prepayment medical care plans—

> All of these plans show a uniformity of desire for the immediate setting up of a national plan on a voluntary basis In all of them the urgency of this being done is stressed Accordingly your reference committee *recommends* that the House of Delegates of the American Medical Association instruct the Board of Trustees and the Council on Medical Service and Public Relations to proceed as promptly as possible with the development of a specific national health program with emphasis on the nationwide organization of locally administered pre-payment medical plans sponsored by medical societies

That was passed? DR. SENSENICH Yes, sir

SENATOR DONNELL And there was a conference held in Chicago in February of this year at which time there was organized a corporation to be known as the Associated Medical Care Plans, a national nonprofit organization Is that correct? DR. SENSENICH Yes, sir

SENATOR DONNELL And the details of the objects of the new corporation are set forth in your statement which is being filed with the committee? DR SENSENICH That is right

SENATOR DONNELL The point I desire to make, Doctor is this That the American Medical Association is approaching this problem with what it deems to be the utmost of speed consistent with efficiency in the solution of it. Is that right? DR SENSENICH Yes, sir

SENATOR DONNELL I want to take this opportunity of concurring with our distinguished chairman in the importance of the American Medical Association presenting to this committee its views and its reasons for thinking that voluntary methods can be adopted and I join thoroughly with him in the hope that the Medical Association will give to us the benefit of all such evidence as it can Doctor, I would like to ask you one question at this moment, arising out of a comment I think it was made by Mr Green of the American Federation of Labor yesterday in his very interesting testimony He suggested, in substance, that the source of the funds of various organizations which are opposing the plan embodied in S 1606 be made the subject of inquiry, and in response to a question asked him he at that time indicated that he thought the American Medical Association was one of those organizations the funds to support which should be inquired into May I ask you if you would be kind enough to state to the committee the source from which the funds which financed the American Medical Association are derived? *DR SENSENICH I will be very happy to* sir There is no secret about it We have dues from the Fellows of the American Medical Association, and we receive no dues from the members of component societies We publish certain medical publications from which there is some advertising income, and that is the source of our income

SENATOR DONNELL Do you have income from advertisements in THE JOURNAL which is published? DR. SENSENICH Yes, sir

SENATOR DONNELL Do you know about the proportion of the annual income which is derived from advertising? DR. SENSENICH I could not say that offhand I would be glad to *give you that information* The point is that THE JOURNAL is furnished to each Fellow for $8, and THE JOURNAL costs more than that to publish. Now, there is some coverage from the advertising income, but it would not be possible to publish THE JOURNAL at that income per year if there was not some advertising from it. We have no other sources of income

SENATOR DONNELL I was doing the very thing that Senator Pepper was doing, breaking in on your answer, but would you be kind enough to furnish for our record a brief compilation of the sources of income of the American Medical Association during the year 1945? DR SENSENICH I will be very happy to It is published each year in THE JOURNAL, and I will be very glad to

SENATOR DONNELL Another matter that I would like to ask you about is this You spoke of the comparative health in the United States and other countries Has there been a compilation of statistics on that question prepared and does it appear in your testimony? DR. SENSENICH There has been one prepared. As little information is now available in war torn countries the information that we have that we can depend on is of a little earlier date. I am under the impression that we had it in this report.

SENATOR MURRAY While you are looking for that, I would like to call attention to the fact that Dr Fishbein declares in his editorials in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION that health conditions and the standard of medical service are higher in the United States than anywhere else in the world, but at the same time it is found from an investigation in the country that the United States is not the healthiest country in the world You take, for example, the infant and maternal mortality rate In 1942, 40 babies died at birth for *every thousand born In one state the rate was 98, and 80 in* another, and we find similar conditions in many parts of the country My understanding is that a study of comparative health conditions in this country with some other countries of the world will show that the United States is not the healthiest country in the world

DR SENSENICH Senator Murray I will be glad to give you that information, and I think that that is included in the presentation of Dr Howard When you go comparing health statistics, you must know all the facts When it comes to children, for instance, I picked up the report of the health department in my own city the day before leaving, and I regret I did not bring it along The lowest rate quoted as I understand is Sweden which is 29 per thousand, and South Bend was 26 and a half The rate is very much better in Sweden than it is in a good many other places but you must remember when you are dealing with infant mortality that there are ways in which the information is gained I have it on good authority that the English do not record their infant mortality on the *same basis that we do I am letting others go into that in* more detail but the figures themselves are somewhat misleading We have and we do maintain that we do have the best health, and I think that we can judge that For instance, in New Zealand the figures given refer only to the European population, the white population We include everybody in our statistics

SENATOR MURRAY Of course, when we discuss this problem which is the healthiest nation of the world, we overlook the fact that even in the healthiest nations in the world and in our country here, notwithstanding the fact that it is comparatively better than other countries still here in this country there are thousands of people every day going without medical care because they are unable to pay for it There is no dispute on that. If a person wants to investigate it, it is a fact that throughout the country people in fairly moderate conditions fail to avail themselves of medical care because of the cost of it They are afraid to A man at the head of a family, with children going to school, and he is earning a fair income of say, $2,000 or $3,000 a year, and he is afraid to incur the expense of medical examinations and medical treatment on account of the cost of the thing There is no question about that, and it seems to me that some way must be found to make it possible for every one in this country to have access to the best possible modern medical care and hospitalization We do not have it, and the country suffers severely as a result of ill health in this country We lose millions of dollars every year, and nothing could be better for the welfare of our country than to have some system where every family can get this care without hesitation

DR. SENSENICH Senator Murray, I would not deny that there are people who should have medical care who are not getting it *From my own experience as a practicing physician for a good many years, and I do my turn on staff duty in the* hospitals as well, I can say definitely that the number of people who come to me or appear as charity patients in the wards, or with whom I come in contact who are ill who have not had medical care because they have neglected the case because they feared the expense, is negligible as compared to the individuals who did not have medical care because they neglected it. That is our principal difficulty I admit that there

are areas and there are individuals where education public health education and many things are lacking and the whole problem is a little more complex than simply the provision of an insured medical service

SENATOR PEPPER Doctor, further referring to the report of the subcommittee made on page 3 we have compiled the data between the ages of 15 to 64, and this is from the National Health Survey The data on the group between the ages of 15 to 64 show that in the category of less than $1 000 annual income they had 11 6 days of illness a year In that group they received 2 2 doctors' calls There is 11 6 days of illness and only 2.2 doctor's calls in the year in the group receiving $1,000 or less In the group receiving $1,000 and less than $2,000, the same age group they had an average of 7 9 days of illness a year, and they also got substantially the same number of doctors' calls In the group below $4 000 they had 6 7 days of illness a year, and they received 3 doctor s calls a year But when you get up in the highest group, above $10 000 a year annual income, you had less than 7 days' illness a year and yet they had 5 5 doctor's calls So as you go from the bottom up in the economic scale, down at the bottom you find more days of illness and less doctors' calls As you go up the ladder to the income group of $10 000 or more you find fewer days of illness and more doctors' calls That obviously had a relationship to the ability to purchase the medical care DR SENSENICH I am glad to discuss that with you If that information was taken from the Public Health Service a few years ago you must recall that the individual who had one leg off was ill so far as the record was concerned He was counted, although obviously he needed no medical attention The individual who had permanent impairment of any kind was counted as ill

SENATOR PEPPER Leaving out for all the differences in the basis of the calculations, would you not say that it is a basically correct principle as you said a while ago that the need is greatest in the income groups least able to pay? DR. SENSENICH Senator Pepper we have a witness following me who I think will be able to show that in every insurance system in the world the period of illness increases and the increase is very, very great.

SENATOR PEPPER I was getting at the basic thing you wanted to tell us Of course we have not given you very much chance to tell us, but the basic thing you started off to say was that you admitted that the lowest income groups of the nation have the greatest need for medical and hospital care? DR. SENSENICH That is right

SENATOR PEPPER Yet you felt it unsatisfactory to blanket into the same insurance system the people in those categories with the people in the higher income groups where the need for medical care was not so great, as I understood you

DR. SENSENICH Because you are going to increase the rate to the rest of the people If this person is medically indigent we will say, then he should be frankly so treated. I do not like to mislead the rest of the group who do not have such large incomes to carry the burden of this group here I think that if they need assistance they should have assistance We have said that again and again but we object to the manner of assistance because we feel it will cause the deterioration of the quality of medical care and service to the rest of the people

SENATOR PEPPER I believe you also said a while ago in response to a question of mine that you did believe that the people unable to pay for the kind of medical and hospital care they needed should have it? DR SENSENICH That is right

SENATOR PEPPER If they are unable to pay for it and they should get it by hypothesis then the funds with which they shall get that care will have to come from some public source or out of the charity of the medical profession? DR SENSENICH That is right

SENATOR PEPPER If the funds come from a public source will that not be raised from taxation? Will not the people that pay the most of the tax be the people in the highest income group? DR SENSENICH But in this insurance plan you are not doing that

SENATOR PEPPER I am asking you will that not be so? DR SENSENICH But the kind of tax at so much per head to the individual is not an even distribution

SENATOR PEPPER What I am asking is this If we do not have an insurance system you provide out of the public treasury federal, state or local, or all the medical care needed by the people who cannot buy it in the regular way That money will have to be raised by taxation? DR SENSENICH That is right.

SENATOR PEPPER And will not the people that pay the tax principally be the people in the higher income group? DR. SENSENICH But they will not under this plan

SENATOR PEPPER I am not talking about the plan DR SENSENICH If you are going to confine it to that, to the insured group, then the insured group is going to pay the tax, not the group above. After all if you are going to support it from taxation the whole group ought to pay it

SENATOR PEPPER Then, if the whole group is going to pay it, do you want to put a sales tax or some other tax and make the full payment into the federal treasury of the funds that will be donated out later to make up this medical service? If they do it is the same as the insurance principle DR SENSENICH I think not I believe the taxes are set up to include everybody and individual people according to ability to pay

SENATOR PEPPER You tax also according to ability It is contemplated to be a percentage of payroll up to $3,000 a year SENATOR MURRAY $3,600

SENATOR PEPPER The figure I have heard is that the worker pays 1 5 per cent and the employer pays 1 5 per cent and the self-employed pay 3 per cent up to $3 000 a year The fellow who made $600 a year would pay on the basis of what he made. The fellow who made $3 000 a year would pay on the basis of what he made That affords the central part of the funds out of which these services would be provided

DR SENSENICH May I say this Senator Pepper that after all the man who is insured and employed will pay once but if he has 2 other earners then they pay 3 You are going to put the burden on one group this insured group in proportion to the number of earners in the family to accumulate a fund to carry the indigent and those in between indigency whose burden should fall on the whole group

SENATOR PEPPER If you provided funds out of the federal treasury by ordinary taxes would not the earning members of a family pay the larger part of the taxes? DR SENSENICH But not to the same degree

SENATOR PEPPER They would pay it in to the federal treasury DR SENSENICH They would not pay that amount of tax

SENATOR DONNELL It seems to me Mr Chairman that there is a very fundamental point that perhaps we have not emphasized in the questioning as much as we should have of the doctor As I understand the doctor's views he inclines certainly toward the correctness of the statement referred to at page 3 of his testimony in which he quotes from the reference committee as follows

> Positive proof exists from experience in other countries that inferior medical service results from compulsory health insurance

Senator Tunnell directed a question along that line this morning I would like to ask a few questions along this line. I proceed with the hypothesis that everybody, all of us here in this committee and the doctors and the laymen alike are interested in improving health conditions in our country I am right in that, I believe DR SENSENICH Definitely so sir

SENATOR DONNELL I appreciate in your testimony page 16 you point out statistics as published in the Encyclopaedia Britannica Book of the Year 1943 of the comparative death rates of the large nations, that the rate in the United States was 10 5 in England 12.9 England has a compulsory system has it not? DR SENSENICH Yes

SENATOR DONNELL Germany 12 3 Bulgaria 12 5 Sweden 11.2, Chile 19 8 Japan 17 6 and New Zealand-European 9 8 DR. SENSENICH That is right

SENATOR DONNELL So that the comparative death rates indicated there it would seem to me Doctor tend to substantiate you that the health conditions in this country are on the whole certainly favorably compared with those of other nations DR SENSENICH That is right

SENATOR DONNELL That does not limit the fundamental importance of attempting to improve the conditions? DR SENSENICH If we bring it down to 5 5 the American Medical Association would be very delighted

SENATOR DONNELL Yes sir May I supplement your testimony by pointing out that in addition to action of the House of Delegates in addition to the formation of the corporation to which I refer one of the purposes of which is by authority granted by the state of Illinois, to quote your testimony

> To promote establishment and operation of such non profit voluntary medical care plans throughout the United States and Canada as will ade

quately meet the health needs of the public and preserve and advance scientific medicine and the high quality of medical care rendered by the medical profession of the two countries.

I say, in addition to that I observe, as set forth in your statement, that a meeting of the commission to carry out these general ideas has been called for the 26th and 27th of this month DR SENSENICH That is right.

SENATOR DONNELL In Chicago And you anticipate these plans will be presented for approval to the first meeting of the members of the corporation, now tentatively set to be held in San Francisco in July? DR SENSENICH That is right

SENATOR DONNELL Regardless of the fact that statistics seem to indicate our health conditions are perhaps better than we may realize, nevertheless the American Medical Association realizes the importance of the problem and is moving as rapidly as it can and as diligently as it deems practicable? DR SENSENICH That is correct.

SENATOR DONNELL Doctor, your idea is that the experience of other nations shows that, however desirable of embracing within the beneficent jurisdiction of any health insurance plan as many people as possible a plan may be, compulsory insurance has proved too defective in that it produces inferior quality of medical service? DR SENSENICH And prolongs illness

SENATOR DONNELL And prolongs illness

SENATOR MURRAY Right there, could you have the doctor explain how he arrived at the theory that it results in the deterioration of medical care? DR SENSENICH May I look to the other witness who will follow me for that.

SENATOR MURRAY That is very confusing to the committee to have a witness make statements of that character and then not be able to substantiate them before the committee. DR. SENSENICH They will be substantiated

SENATOR MURRAY These hearings are very complicated and I wish we could settle some of these questions as we go along I think it is unfair to make a bald statement of that kind and have to wait for some other witness to prove it. DR SENSENICH The witness is waiting right here, sir However, I can go into this much of it Immediately when you remove responsibility and relationship between the patient and the physician and inject the government in between the quality of service deteriorates

DR SENSENICH When you go to the Surgeon General of the United States Public Health Service and give him the right to say who shall practice, who can come in who cannot what he shall be paid, the conditions under which he shall practice, there is no one in between the patient and the doctor?

SENATOR MURRAY He operates with an advisory committee DR SENSENICH He is not held by anything I am sorry sir, I did not mean to interrupt you.

SENATOR MURRAY That is all right He operates under an advisory committee, and that advisory committee works with him in determining the qualifications of these doctors and to determine who are specialists This same practice is followed today by the medical profession is it not, in the country, to determine who the men are who are qualified to act as specialists, in the big hospitals of the country? DR. SENSENICH Yes sir

SENATOR MURRAY Well, what is wrong, then about the Surgeon General, working with the American medical profession and having their advice, specifying who the men are that are to be qualified as specialists? It is not true that under the bill the entire medical profession of the United States are placed under the direction of one man, the Surgeon General of the United States Public Health Service Section 203 of the bill, which relates to administration, is concerned not with the administration of medical practice but with the administration of the system of paying for medical care I do not see how the service would deteriorate. As a matter of fact, the greatest discoveries and advances in medicine have been made by men not actually practicing medicine They are found in laboratories Most of the great advances that have occurred in this country and other countries throughout the world have been the result of men working on salaries in laboratories and patiently studying and developing methods of cure for diseases Is that not true? DR. SENSENICH Yes But those men are specialized in particular fields That has nothing to do with the subject under discussion.

SENATOR MURRAY Why should a doctor physician or surgeon, permit his service to deteriorate merely because he is being paid out of a fund for the services he is rendering and being guaranteed that his services are going to be paid for when he performs them? DR SENSENICH Did the Veterans Bureau develop anything in twenty-five years of sufficient patients of sufficient funds and sufficient establishment of that good service?

SENATOR MURRAY I do not think that is any comparison DR. SENSENICH But that is government medicine

SENATOR MURRAY And you think this is government medicine? DR. SENSENICH Yes

SENATOR PEPPER What about Walter Reed and the Naval Hospital? Do you claim Walter Reed and the Naval Hospital are inferior? DR SENSENICH I am not familiar with the work of Walter Reed and the Naval Hospital at the moment Like every other institution, some have good work

SENATOR PEPPER That is true of private hospitals? DR SENSENICH Yes On the other hand, let us not forget that the work of the war was done by private physicians in the Army They have good men in the service, but there is something about the government service that deteriorates, and it has done so all over Europe

SENATOR MURRAY Has the service in the Kaiser hospitals deteriorated because the physicians are being paid? DR SENSENICH They have not operated long enough to know and there are no available statistics

SENATOR MURRAY You are not saying they are not rendering efficient service? DR SENSENICH We accepted them for intern training, and after a little time we will be able to tell you whether the work is good or not.

SENATOR MURRAY You do not have that here? DR SENSENICH It would be impossible to judge a few years under wartime.

SENATOR MURRAY Our understanding is that the Kaiser hospitals and the system he has provided out there does furnish the most modern, adequate medical care to his men, and it has worked so satisfactorily that it has been extended to the families of the workers in his plants DR. SENSENICH Senator Murray, those things take a long time to find out what they amount to I do not mean a "long time," but operation over some time.

SENATOR MURRAY I am more interested in the middle class of this country, the people that earn all the way from $3 000 or $4,000 up to $7,000, $8,000 or $10,000 a year I find around the country, talking to those people, that they have great difficulty meeting medical costs and hospitalization expenses They tell me that when they go to a hospital they have their financial situation inquired into, and they are charged a very high fee sometimes The doctors will investigate their financial situation and make them pay out of proportion to others Does that system prevail in the country? DR SENSENICH It does not, sir

SENATOR MURRAY Have you not heard of cases where they charged $2,500 for an operation? DR. SENSENICH I have heard of that in some instances I think that is a rarity

SENATOR MURRAY You think so? DR SENSENICH I have had no personal contact with those big fees

SENATOR MURRAY Is that so? Well, I have had some contact with them, and I have a very vivid recollection of it And I talked to another Senator about it DR. SENSENICH Perhaps, if I may interrupt, I did not investigate as well as you did

SENATOR MURRAY Well, I will tell you that any person that goes to a modern hospital today will find that he will have his financial situation investigated and he will be charged according to what they think he is able to stand That is the system. I do not think the system is satisfactory to the American people and I think that the great masses of the people want to find some way that they can get modern medical care without being overcharged and also get it without having to take a pauper's oath I think there is nothing un American about that, any more than the workmen's compensation laws or our present school system supported by the government.

SENATOR TUNNELL Could I ask just one question, Doctor? In your comparison of health conditions in the United States and other countries do you think that is influenced by other things, such as hygienic conditions including the kind of home the standard of living, as the result of different wage scales so that it is hardly just a comparison of medical treatment? DR SENSENICH Very greatly, sir In these areas of such low economic income many factors enter into the health Senator, may I say to the chairman with reference to overcharging do not mistake that. The American Medical Association does not approve of overcharging You used that word. SENATOR MURRAY Yes DR SENSENICH We must not forget that the great bulk of the population in the United States lives in towns under 12,000, and if you could get a big fee if you

wanted to, out of any patient in a town of 12,000 the whole town would know it and exclude you from that time on I have never known of that experience.

SENATOR TUNNELL There are frequently differences as to what is overcharging? DR SENSENICH That is true

SENATOR MURRAY Doctor, you were discussing a short time ago the American medical profession and the fact that it collects a very large sum, is very strongly financially supported and has accomplished a great deal of good for the medical profession? DR SENSENICH And for the public as well, sir

SENATOR MURRAY And for the public as well, through their medical journals? DR. SENSENICH Yes, sir

SENATOR MURRAY Very well Are you acquainted with the National Physicians' Committee? DR SENSENICH Yes sir

SENATOR MURRAY Can you tell me something about the National Physicians' Committee? DR SENSENICH I have no connection with them The American Medical Association has no connection with them They are a body of their own and for their own and have been interested in various things with reference to the medical situation There is no tie-up between the two organizations. The House of Delegates has approved their objectives, but we have nothing to do with their management.

SENATOR MURRAY But they are supported largely by members of the medical profession? DR. SENSENICH They would have to give you that information themselves I do not know

SENATOR MURRAY I see. Well, they circulate literature to the medical profession, do they not? DR SENSENICH I do not know, sir

SENATOR MURRAY Have you not seen that? DR SENSENICH I have some but I do not know that that is general to the entire medical profession

SENATOR MURRAY I assume it is general because in every part of the country I have visited I find that the medical profession there are well stocked with propaganda from the National Physicians' Committee. In fact, on one occasion I attended a meeting of the medical profession where the speaker of the evening delivered an address which was a complete copy of the pamphlet got out by the National Physicians' Committee in which this legislation is charged with being socialized or political medicine and makes misrepresentations from start to finish of the purposes and objects of the bill and the provisions Have you seen that pamphlet? DR SENSENICH No

SENATOR MURRAY You have never seen it? DR SENSENICH I do not know the one that you speak of I do not know the statement which you characterize as "propaganda" what the statement was

SENATOR MURRAY It was a pamphlet which they issued And I will be glad to get a copy of that pamphlet and have it inserted in the record It was a pamphlet which undertook to portray this legislation as socialistic, dangerous and misrepresented practically every provision of the bill You have never seen that? DR SENSENICH I am not sure that I have sir

SENATOR MURRAY Well, it was distributed very widely across the country, and many hundreds of thousands of dollars was spent by that committee in circulating it and deceiving the profession to a very large degree Medical men read that and believed it I can see that from the fact that I received letters from them in which they quoted sections of the pamphlet to me which were entirely false. That committee, however is a committee which is engaged in propaganda for the purpose of discrediting this legislation. You know that, do you not? DR SENSENICH No, I do not know that, sir

SENATOR MURRAY All right. I am surprised, because pretty nearly every person in the United States who has been following this legislation knows as a matter of fact that there is such an organization and just exactly what it is doing DR. SENSENICH Senator Murray, after all, those who disagree with us are always doing propaganda. That is the choice of the word I could not quite understand, sir

SENATOR MURRAY Well I have a copy of the pamphlet here, and I will ask to have it inserted in the record at this point.

SENATOR DONNELL Doctor, I thought it might be helpful if you could just give us one two, three, four the statement of the reasons why you are opposed to S. 1606 I have your point that you think it would bring about a deterioration in service. And you quoted as I take it with implied approval at any rate, the report of this committee that positive proof exists from experience in other countries that inferior medical service results from compulsory medical insurance That is point number one. DR SENSENICH That is right

SENATOR DONNELL Would you be kind enough to tell us the next point on which you oppose this bill? DR SENSENICH I would say first of all Senator Donnell, that the important thing is that there is nothing about this plan which has anything to do with preventive medicine That is the first thing, nothing in it which establishes any standards of preventive medicine or accomplishes what we would like to see done Secondly it does bring about a deterioration of medical service because of the fact that it brings the government in in a manner in which the profession is regimented and the public is regimented and that is not good.

SENATOR DONNELL I want a concise statement of your general points I think it might be helpful if we could center on some matters important but perhaps not quite as much along the line as giving us concretely your views as to this particular bill

DR SENSENICH Senator the second one, the statement you first quoted and in which I approved, is of course very broad It not only tends to deteriorate the quality of service but those who give the service not that they deliberately choose not to give the service but the interest is different. It is a rather intangible thing The third subdivision of that same point is the fact that it removes the free choice of physicians

SENATOR DONNELL Have you observed from your study of conditions in other countries any effect arising from compulsory health insurance where physicians have a certain number of persons beyond which they cannot go in treating them have you observed any effect on the initiative of physicians? DR SENSENICH Yes indeed, sir And that is incorporated still further in the report you will hear from another witness

SENATOR DONNELL Which witness is that? DR SENSENICH Dr Kennedy

SENATOR DONNELL Dr Kennedy of New Castle, Ind.? DR. SENSENICH Dr Kennedy of New Castle, Ind., who has studied and had close connection in foreign countries

SENATOR DONNELL Yes, sir DR. SENSENICH So that the deterioration of services depends on those things not so tangible and things more tangible in the fact that it does destroy the choice of physician. Obviously the choice is limited only to those willing to accept the plan and in every European country there are many who do not accept the plan And for those who do there is a tendency to be crowded. The income is low, and they treat many more patients than the average physician would treat in a given period of time. Whenever you standardize the control by regulation you standardize at a low level It is not the superior it is the low level, because it must include everybody and as a consequence there is that constant tendency to decline. And any time you remove the direct responsibility between the physician and the patient you incur an accumulated volume, we will say, of just omissions of one kind or another They are not intentional When I am called to see you, Senator, it is a responsible position and only God and your doctor know whether you are getting good medical care or not You cannot judge and no one can follow up every doctor to determine how he does his work Therefore it is important that the greatest responsibility exist between you and me I must have that consciousness of the necessity and of the rightfulness of doing everything that must be done

SENATOR DONNELL Do you think the provisions of this bill S 1606, would tend to reduce the care and effort on the part of the physician or the initiative of the physicians or do you not? DR. SENSENICH It diminishes the initiative, and over a period of time it tends to remove just the thing we are talking about that responsibility That is not so tangible, but on the other hand, you will learn more from a discussion of where these plans have operated and what actually happened. That is the reality end of it You cannot say what does it.

SENATOR MURRAY I notice that the Senators here avail themselves of the opportunity of going to a hospital here for medical care without having any contact with the physician previously that treats them They go to an administrative officer of the Navy here in Washington and he assigns them to the hospital DR. SENSENICH Yes

SENATOR MURRAY They go to the hospital without knowing who the physicians are or anything about them, and they are very satisfied with the treatment and the care they get. I hear the comment frequently that this idea of relationship between the physician and the patient in modern medical practice is

more or less a myth I know of cases where people have traveled all across the continent to go to a particular doctor and when they get there they find the doctor is too old or sick, and they have to take somebody else whom they never heard of, and the operation is entirely satisfactory in every way All members of the Senate and House go to physicians they do not know I am sure if you left it to a Congressman to select his own physician in the community he would not know how to do it

DR. SENSENICH Senator Murray—

SENATOR MURRAY Yet they talk about preserving the right to select your own physician In modern times the average citizen of the country is not capable of selecting his own physician. That is to say, nine times out of ten he might make a very serious mistake. I think that the system here that we have where the medical men are classified whether they are to be experts and the kind of service they render is good and a person can go to them qualified by education and experience and the practicing doctor can do just as good a job as if they were selected by the patient from private practice

DR. SENSENICH Senator Murray, you are talking about an institution to a specialist. Let us bring that back down to the average practice that is not in the hospital itself You go to some supervisor who authorizes you to go to the hospital Suppose you are ill at 2 o'clock in the morning Is the supervisor available? Does he approve of your admission? If you go to the hospital and you do not like the particular physician to whom you go, you are at liberty to change. But under this system you can change only provided the other man is included in your plan There are many things that make a vast difference between your relationship with your physician under existing conditions where you are entirely a free agent and can do as you like. Or, on the other hand, there is the individual who is limited in his selection to those who have approved of the plan, which in some countries has not included the better men

SENATOR TUNNELL Let me suggest something which I think the doctor means but has not spoken clearly on Would the poor doctor get just about as much practice as the best one under the theory you speak of? DR SENSENICH That is the way it works, because your standards must be low enough to include the whole number They are never satisfied The individual who is able to pay or has any means of getting outside the plan is very apt to go to some physician not included in the plan.

SENATOR DONNELL I think Senator Tunnell touched on an important point. I would like to ask one question on it Suppose there are 10,000 people in a community and 10 physicians Under this plan we will say that the physicians in that community elect to adopt the per capita pay basis Then the 10 physicians would announce themselves to be prepared to go in under the plan We will presume that all 10 of them accept the plan DR. SENSENICH Yes

SENATOR DONNELL Whereupon there is assigned by the Surgeon General to those physicians a quota beyond which those physicians cannot go DR. SENSENICH Yes

SENATOR DONNELL There would be a very strong tendency on the part of the Surgeon General in a given community to set aside 1,000 for each physician, or some variation but at any rate the poor physician would as Senator Tunnell so well indicated, be apt to have about the same number of persons assigned to him as the better physician That is probable is it not? DR. SENSENICH That is right

SENATOR DONNELL It is a matter of tact and courtesy and judgment on the part of the Surgeon General that is correct is it not? DR. SENSENICH Yes

SENATOR DONNELL May I ask you also, in that connection would there not be a strong tendency on the part of the population if they know one doctor was much better than another to register very quickly under that doctor, so that the fellow who was late would find himself remitted back to the inefficient doctor? DR. SENSENICH That is right.

SENATOR MURRAY Before you leave that, you admit then, that there are a lot of inefficient doctors in the country? DR. SENSENICH Some doctors are better than other doctors let us state it that way sir They have to meet certain requirements as to registration

SENATOR MURRAY They have the same fundamental education? DR. SENSENICH Nearly so

SENATOR MURRAY Some doctors have what they call better "bedside manners' and make themselves more attractive to the patients? DR SENSENICH I do not think that amounts to much sir

SENATOR MURRAY It is sometimes claimed that some doctors have personalities which attract the attention of the patients and which probably is an advantage. I am not criticizing it DR. SENSENICH May I answer that point? I do not think the matter of 'bedside manners" is anything Of course, a gentleman either sells himself or he does not. But as a matter of fact the one thing greatly overlooked in the discussion of legislation is the fact that you cannot divorce a man's illness from his personality And there is one complaint that comes again and again and again, and that is that too often at the clinics they never get people well It is a matter of attending physical illness and a continuing kind of symptom whereas the individual needs a sympathetic understanding Many times he is more disappointed than ill, more worried than sick Many things enter into that, and the physician who can deal with that man's personality and restore him to his normal state in society as a responsible individual and some one who is at least fairly satisfactory to himself emotionally and mentally is the physician who has the patients Let us omit the 'bedside manners" and admit that there is that difference between physicians, and that is the kind of physician we want to preserve in the picture, because he is the man who serves best.

SENATOR MURRAY Of course, men with those qualifications are favored in the community and get the best end of the practice at the present time under the present system? DR. SENSENICH That is right, sir

SENATOR MURRAY And they cannot take care of all the people in the community? DR SENSENICH That is right.

SENATOR MURRAY The result is that people in poorer circumstances are not able to get the services of those physicians who have such qualifications as you have described DR SENSENICH They are not necessarily excluded, sir Their selection is not on an economic basis

SENATOR MURRAY They are excluded if they cannot pay the fees If they cannot come up to his requirements in the way of compensation they are DR. SENSENICH No, I think not, sir I would not agree to that.

SENATOR MURRAY Then the system is very precarious, it seems to me. The public is not able, nine times out of ten, to determine just who this physician is that has all these qualifications that you mention, and he just has to pick at random under the present system. It seems to me we ought to have a more definite system than that, where men are qualified in the modern medical care and methods of taking care of modern diseases It should be scientific and not so much a matter of psychology More or less science DR. SENSENICH Yes

SENATOR MURRAY And if a doctor is properly qualified to practice medicine and has gone through the proper training, has been an intern and has had experience, it seems to me that he can give adequate care without necessarily having some of these other qualifications as regards personality

DR SENSENICH After all, you will admit the desirability of a certain amount of incentive, possibility of advancement, and of progressing You must admit that even though you do have a very high percentage of physicians that are comparable in the high quality of their work and in attendance on things I discussed with reference to personality and so on and so on, yet if you take all the competition out of it, all the incentive and all the means of progressing and tie him down to a dead level with the rest of them, how long do you think he will continue to be the good kind of man we are talking about, as long as the Surgeon General assigns a certain number of individuals at a certain price?

SENATOR MURRAY I do not see why he should deteriorate any more than the scientists deteriorate merely because of that. They sit away in a secluded spot and work out the problems, such as the scientists who developed the atomic bomb It seems to me that the mere fact that they had no contact with anybody by sitting in there in a laboratory diligently and patiently working this out, they were just as competent as if they had been in a different situation where they had come in contact with the people waiting to have these bombs supplied. DR. SENSENICH Senator Murray, you are familiar with the general exodus of scientists from government employment to the places where they were happier than they were in government employ?

SENATOR MURRAY I am not. I do not know that the scientists who worked out the atomic bomb were unhappy DR SENSENICH I do not know how many were on the atomic

bomb I know the scientists in the research work have gone back to where they were happier

SENATOR MURRAY That would be prefectly natural DR SENSENICH That would be perfectly natural, and you must recognize that the physician is an individualist and if he is not satisfied in government employment he is not going to remain Not all physicians will elect to take it

SENATOR PEPPER Well, a physician does not have to come under this plan Any doctor in my home town a choice doctor who has a big private practice, does this law make him come in? DR SENSENICH No, but I think that the head of Social Security the other day admitted that if the citizen wanted his services he had to pay twice He paid the compulsory insurance and also paid his separately

SENATOR PEPPER That is correct, but the doctor himself, from the viewpoint of the doctor, does not have to come under this plan unless he agrees? DR SENSENICH But you would like to have him in the plan I did not mean to interrupt.

SENATOR PEPPER I think it would be desirable to have him in the plan DR SENSENICH If you do not have them you would lead to the deterioration of service

SENATOR MURRAY The bill permits him to perform partial service under the plan and also remain in private practice DR. SENSENICH That has not worked out too happily, sir

SENATOR PEPPER Doctor, is not what you are saying based on ignoring the fact that everybody recognizes that this is not offered as a panacea for all ills and to make everybody happy and immediately well and keep them well? It is a question of comparison of this proposal and its effect, the good and the bad of it, with the good and the bad of the present system or the good and the bad of a system that is based on voluntary membership under various plans Now, I am sure that nobody has attempted to give you the inference that this was a perfect plan, that it met everything that everybody would like to have met but the essential problem is is it in the overall better for the people of the country than the present plan or than a system of voluntary plans all over the country? Our opinions may differ about that But should not one weigh against this case the masses of the people that do not have any doctor and can never get this high priced specialist that charges these big fees and deserves them for his skill? In life do you not find you have a balance of interests? DR SENSENICH Senator Pepper, that is exactly what we are trying to do, and I have with me today these witnesses who will present the very factual points

SENATOR PEPPER Very well DR. SENSENICH In an effort to establish first of all whether there is the need we think there is and what the effect would be on this or whether it would not be better to give a little time to some voluntary system

SENATOR DONNELL Doctor returning to the question of freedom of choice, we will take this situation I mentioned where the per capita system of payment is agreed on by a majority of doctors, and at a given place we will say there are 10 doctors and 10,000 people, and we will say 1,000 are assigned to each one of those doctors There is a difference in the ability of those doctors just like lawyers dentists shoemakers and anybody else? DR. SENSENICH That is right sir

SENATOR DONNELL And some doctors are able to make greater success than others even though all of them have passed the examinations prescribed by the state laws and the examinations in the medical schools? DR SENSENICH That is right.

SENATOR DONNELL Under this plan as I understand it in a case such as I have cited if the people in a community recognize Dr A as of outstanding ability it would appear to me that his quota would be promptly filled? DR. SENSENICH That is right sir

SENATOR DONNELL And the other people who did not get on his quota would be remitted back to the other gentlemen? DR. SENSENICH That is right.

SENATOR DONNELL Some of whom may or may not be as qualified as Dr A? DR. SENSENICH That is right

SENATOR DONNELL The very fact that Dr A has acquired confidence in the community is some evidence that he is better qualified than some other practitioner? DR SENSENICH That is right

SENATOR DONNELL Under the present situation, as we now have it we have the privilege of going to a doctor and he has the privilege of determining whether he can or cannot take us Is that right? DR SENSENICH That is right

SENATOR DONNELL There is no governmental compulsion? DR SENSENICH That is right

SENATOR DONNELL Whereas under the system I described there is governmental compulsion from which there can be no variation? That is correct, is it not? DR. SENSENICH Yes

SENATOR DONNELL With respect to the situation here relative to Congress that the chairman referred to I appreciate the fine services which Dr Calver has rendered, and in the *Saturday Evening Post* there is a very interesting article on that It is true that if a number of members of Congress go to Dr Calver, all Dr Calver has any legal authority to do is to make recommendations which members of Congress may or may not follow? DR. SENSENICH That is right.

SENATOR DONNELL But if the law goes into effect, and Dr Calver has 1,000 people, and 1,001 comes up he cannot administer to the treatment of number 1,001, that is correct, is it not? DR SENSENICH That is right.

SENATOR DONNELL Now, I want to ask you also under this bill what your opinion or judgment is as to the degree of power placed in the Surgeon General by the authority to designate the practitioners who shall be qualified as specialists or consultants? Do you regard that as a power that is fraught with some dangers, perhaps, to put it in one man's power to make that determination? DR SENSENICH There is no method provided by which he is judged It is a bureaucracy in its administration

SENATOR DONNELL I observe that there is some statement that he shall determine for each specialist in accordance with general standards previously prescribed by him after consultation with the advisory council but the authority to set forth the standards is vested in the Surgeon General one man? DR. SENSENICH That is right.

SENATOR DONNELL And the very term 'advisory council' speaks for itself that the council is advisory and has no ultimate power? DR SENSENICH That is right

SENATOR DONNELL Even if it did have the power, it would vest in a group of men and women the power to determine whether or not out in my own home or Senator Smith's home, or in Oregon or Washington, whether the particular person is or is not qualified to be a specialist? DR. SENSENICH That is correct.

SENATOR DONNELL Do you regard that as a desirable feature of this bill? DR SENSENICH I do not

SENATOR DONNELL You do not I am not going to prolong this I do want to ask you one more question though in conclusion of the questions I would like to ask along this line We had one witness here yesterday, who I am confident was actuated by the best motives and yet he made a statement in substance that the opposition to this bill is not honest That was the statement. This witness testified of respect for any honest opposition but made the statement that the opposition to S 1606 is not honest. I want to ask you this question Doctor In your opinion as a practicing physician and as a member of the American Medical Association do you think that the position taken by the American Medical Association is actuated primarily by selfish interests or by interests which have to do with the general welfare of the people of the United States of America, and I am going to ask you concretely in answering that question whether in your opinion the action of the American Medical Association was honest or dishonest in opposition to this bill? DR. SENSENICH It is an honest opposition It is definitely an honest opposition and that is further evident in the program of health objectives and nearly one hundred years of performance Remember that the government and the lay people have in no instance created the laws by which health is controlled Our laws have come about at the recommendation of and by the stimulation of the medical profession

SENATOR DONNELL I said that was the concluding question Your answer brings forth this thought The American Medical Association contains about 125 000 persons and represents a very large percentage of the entire practicing members of the profession? DR SENSENICH Yes sir

SENATOR DONNELL I realize asking you the question as to whether or not the action of the Association is honest or dishonest also means I was asking about your own honesty or dishonesty That is embarrassing, and perhaps you are a prejudiced witness but to my mind I think it is proper to ask an eminent member of the profession just as you would a member of the Bar or a member of the Bench with respect to

the legal profession and I want to ask you again this question, and I do close with this

In your judgment as a practitioner, a man whose reputation is at stake, a man who occupies a position such as you do with the American medical profession do you think that the position taken by the Association is taken as a result of some selfish interest of the profession, or is it a position taken as a result of earnest effort to try to bring forth a plan which in the honest opinion of the Association would best serve the health and public welfare? DR. SENSENICH There is no question of the honesty back of it, and for the proper care of health measures There is no question about the honesty in opposition of legislation which we feel will be harmful and we will present such evidence as is available to prove that it is harmful

SENATOR MURRAY Doctor, we have equally important witnesses men of high standing in the country who feel that the American Medical Association is somewhat behind the times in regard to legislation of this kind which is necessary for the protection of the health of the American people We had a witness on the stand the other day who was a very prominent man, of the Harvard Medical School Dr Butler Do you know Dr Butler? DR SENSENICH Yes, I know Dr Butler

SENATOR MURRAY (Reading)

It is inevitable that that association be so in terms of the manner in which its delegates are elected the manner in which everything is referred to a special committee that committee has members who were elected three four and five years ago it is inevitable that such an association is behind the times They have to be reactionary

He also said

I think the major part of the opposition—let me put it this way the major part of the publicity that is given the medical profession and the lay public reflects a selfish interest in maintaining the interests of doctors who are practicing medicine as they practice it today

Again he said in response to Senator Donnell's question

In other words as I take it, your view is and if I am wrong please correct me your view is that legislation such as S 1606 will prove advantageous to the medical profession second that in the absence of such legislation of this type financial embarrassment by the medical profession will generally ensue? Is that correct? DR BUTLER That is correct

And the witness here the other day, William Green, testified that in his judgment this legislation is absolutely necessary for the country and that if it is not passed the American medical profession will be placing themselves in a very serious position, because the people of this country are going to insist on having proper medical care modern medical care for every citizen in the country, within their means They have got to have it.

And it seems to me that the medical profession will be making a mistake if they do not sit down and study this legislation and propose what amendments they think would perfect it, because it is the only way in which you can bring modern medical care to the American people DR SENSENICH Senator Murray may I say that the competence of a witness and the usefulness of a witness depend largely on information and competence and honesty The statement on the part of the doctor from Harvard University was not factual As to Mr Green whom I have had occasion to meet a long time ago I do not know that he is informed.

SENATOR MURRAY He is informed on the condition of the health of his people. DR SENSENICH But he is not in a position to pass on the medical side of it as to the determination of medical care and how to obtain it and the effect on medical care of this system

SENATOR MURRAY They have a division or subdivision set up on their organization which is a very well organized body, and staffed by experts, economists, who have made a very careful study of this problem for the benefit of the American Federation of Labor, and its members and they have come to the conclusion that legislation of this kind is absolutely imperative for the welfare of the country and for the welfare of the great working masses of people DR. SENSENICH Senator Murray, I am not reflecting in any way on Mr Green whom you know and whom I respect However, this kind of problem cannot be answered by economists alone, that is the point I am trying to make

SENATOR MURRAY Surely DR. SENSENICH That also with reference to Mr Green

SENATOR MURRAY And we are not seeking to present a piece of legislation here which is the result of the work of economists We have had very distinguished doctors from all over the country who have cooperated with us and advised us with reference to this legislation. I have had letters from my own state of Montana in which doctors have given me their views on the bill, and many of them feel that this legislation is all right and that it should be passed. Members of the medical profession take that stand I am sure you know that. DR. SENSENICH There are some, a very, very small number

SENATOR MURRAY Well, I have attended meetings where they seem to appear in great numbers DR SENSENICH The trouble is in those meetings there is a certain automatic selection Those that are for go and those against do not That is our experience, at least. May I say, Senator Murray, after all we want every one to have the best medical care, and we will cooperate with any one and anybody in the matter of procuring that care, if it is possible to get it. And we have met with your committee Senator Pepper remembers it and you remember too we met with your committee several times. We were in not so long ago with reference to the Hill-Burton bill We are here not for the purpose of criticizing the people who developed this legislation or promoted it but rather to point out from a factual basis what its effect will be on medical care

SENATOR PEPPER Is it not fair to say that the representatives of the people, such as the Congress, have a perfect right to determine what in their opinion is in the public interest in helping the people preserve their health? DR. SENSENICH That is right

SENATOR PEPPER And this is not a matter that the people have elected the doctors to decide for them. We have got a perfect right to draw up any data that we think are relevant to the subject and to legislate in this field as in other fields? That is correct, is it not? DR SENSENICH Correct, if I may answer one thing I think they would expect that you would get the best advice you could get in the preparation of that legislation I do not think any legislator with nonmedical experience is competent to judge That is with all due respect.

SENATOR PEPPER But you will have to admit in the trial of a case at law a witness who has got a personal interest in the matter, the jury is entitled to know that the witness has a personal interest in the advice he is giving? DR. SENSENICH That is right, sir But we must also know that the public has an interest.

SENATOR PEPPER The difference of it is that we Senators do not make any more money if we pass a good health bill but a doctor may make more if we do not. DR. SENSENICH That is not the fact

SENATOR DONNELL Well, Mr Chairman, I think it is only proper to state at this time that the testimony adduced up to this point by the proponents of the bill has been to the effect that the installation of S 1606 and the plan thereunder will actually prove more beneficial to the doctors, as Dr Butler indicated in his testimony

SENATOR MURRAY To the great majority of the medical profession SENATOR DONNELL Yes, sir

SENATOR MURRAY But not to those at the top of the medical profession

SENATOR DONNELL Well, I think, Mr Chairman, the fact is that the American Medical Association is constituted of over 125,000 practitioners who are physicians all over the United States DR. SENSENICH That is right

SENATOR DONNELL They are representative, do you not consider, of the views of the medical profession taken by and large over the country? DR SENSENICH That is right sir

SENATOR DONNELL And the House of Delegates has expressed its opposition to compulsory health insurance? DR. SENSENICH That is right sir

SENATOR MURRAY And the House of Delegates according to some critics of the American Medical Association is far behind the times in this field? DR SENSENICH I should not say that that was factual They are elected for a two year term and I have never known any democratic institution in which its government body or policy making body did not reflect the attitude and belief of its membership when they are elected every two years

SENATOR DONNELL Is it your judgment that the House of Delegates does reflect the present up to date opinion of the medical profession? DR SENSENICH There is no question about it.

SENATOR DONNELL You mean to say you think it does? DR SENSENICH Beyond question

*(To be continued)*

# National Health Program

## PLATFORM ADOPTED BY THE AMERICAN MEDICAL ASSOCIATION

*One of the ten points in this platform will be published each week*

5 The provision of health and diagnostic centers and hospitals necessary to community needs is an essential of good medical care Such facilities are preferably supplied by local agencies, including the community, church and trade agencies which have been responsible for the fine development of facilities for medical care in most American communities up to this time Where such facilities are unavailable and cannot be supplied through local or state agencies, the federal government may aid, preferably under a plan which requires that the need be shown and that the community prove its ability to maintain such institutions once they are established (Hill-Burton bill)

# Washington Letter

*(From a Special Correspondent)*

May 6 1946

### Invitation to Attend Inter-American Medical Congress at Rio

During a nationwide tour of the United States started this week from Washington three Brazilian physicians will invite American medical men to attend the first Inter-American Medical Congress, to be held in Rio de Janeiro September 7 to 15 under the auspices of the Brazilian National Academy of Medicine The Office of Inter-American Affairs reported that Dr Estellita Lins, first vice president of the congress, Dr Alvaro Cumplido de Sant-Anna general secretary, and Dr Antonio de Moraes Austregesilo Filho, son of the neurologist, will visit New York, Boston, Detroit, Chicago Rochester Minn San Francisco, Los Angeles and Montreal Ten United States authorities in special medical fields will be selected as honor guests of the Brazilian government at the conference The trio reported that Sir Alexander Fleming discoverer of pemcillin, has accepted an invitation to be an honor guest from Great Britain

### Possible Cancer Benefits Expected from Use of the Betatron

Prof Donald W Kerst of the University of Illinois informed the George Washington University chapter of Sigma Xi scientific society, of the possible uses of the betatron machine that creates cosmic ray effects in the laboratory Possibilities that he mentioned were better study of the atom permitting laboratory study of instruments that formerly had to be sent into the stratosphere and cancer treatment. Professor Kerst was reported in 1940 to have produced 2 300 000 volts with the machine, later developing one of 20 000 000 volts He is now building a betatron to produce more than 250,000,000 volts

### Washington Dope Traffic Called "Worst in Nation"

The Senate has approved expenditure by the Narcotics Bureau of an additional $50,800 to hire more agents following a report by Senator Styles H Bridges Republican of New Hampshire, that the Washington drug traffic was a 'national disgrace' and 'the worst in the nation." The sum was included in the $63 000 000 second deficiency appropriation bill, which was sent to conference with the House. Senator Bridges said that the District of Columbia requires as many agents as New England or any five Western states

### Larger Hospital Reservations Advocated for the Tuberculous

Dr Samuel Ingraham, U S Public Health Service tuberculosis consultant has advocated that half of the hospital beds available in Washington be reserved for patients in the early stages of tuberculosis However, spokesmen for the health department declared that it would be impossible to put the plan into effect now because of the shortage of nurses Dr Ingraham estimated that Washington has 11,000 to 15,000 tuberculosis victims, of which he estimated 4,000 need hospitalization

### Nurses Ask That Health Program Include Nursing Care

Miss Katharine J Densford president of the American Nurses Association told the Senate Labor Committee holding hearings on the administration health bill that any national health program should include provision for "necessary nursing care' She declared that no national health program would be 'considered complete" unless it provides for nursing care, not only in hospitals but in homes

### Health Center Bill May Go to House Before Preelection Recess

The bill for financing a 1,500 bed modern hospital center in Washington, to cost $20,000,000, may be sent to the House for action before the preelection recess now slated to begin July 1 One version of the bill was passed several months ago by the Senate. A report of the Metropolitan Health Council is expected to set in motion a new drive for legislation for the new hospital center

### Shrine to Build More Hospitals, Offer Scholarships

William H Woodfield Jr of San Francisco, imperial potentate of the Shrine of North America, reports that the organization plans to expand its free service to crippled children without regard to race, creed or color, to build more hospitals, to start construction of convalescent homes and to offer scholarships to orthopedic surgeons and nurses He made the report during an official visit to Almas Temple of Washington

### Development of Curvature of the Spine in Victims of Infantile Paralysis

Dr E C Harper, director of crippled children's services for the Virginia State Health Department, has reported that approximately 100 youthful victims of the 1944 infantile paralysis epidemic in Virginia already had gradually developed curvature of the spine, although they were believed to have been cured

### Civilian Aid Urged for Handicapped Persons

Dr Howard A Rusk, originator of the Army Air Forces convalescent training program has urged civilian hospitals and communities as a whole to set up rehabilitation centers to aid the one out of every six persons in America who needs 'some sort of rehabilitation help" He is a member of Bernard Baruch s permanent committee on rehabilitation and a consultant to the New York *Times*

### Veterans Administrations Watching Health of Employees

Veterans Administration supervisors throughout the country have been instructed to watch the health of agency employees A directive suggests training in health practices analysis of causes of absence for sickness, health improvement training and other corrective measures

### Encephalitis Among Forces Occupying Okinawa

American occupation forces on Okinawa are menaced by a form of encephalitis, but the navy is reported to have under study a vaccine to combat the ailment. Commodore T M Rivers of the Navy Medical Corps made this revelation to the National Academy of Sciences. Navy doctors got first hand information during an epidemic among natives last summer

### Clinic Service for Epileptic Patients

Announcing the opening of a clinic service for the epileptic here beginning May 6, Dr Leopold E Wexberg, District of Columbia mental hygiene bureau chief, estimated that there are 400 epileptic children among those of school age. He said that epilepsy is curable in children through modern methods and that attacks on adults could be reduced

# Council on Medical Service and Public Relations

## NEW ENGLAND REGIONAL CONFERENCE

The Council of the State Medical Societies of New England cooperated with the Council on Medical Service and Public Relations in sponsoring a regional conference in Boston, Sunday, February 3. The conference was attended by representatives from New Hampshire, Connecticut, Massachusetts, Rhode Island, Maine and Vermont. Dr. James R. Miller, president of the Council of State Medical Societies of New England and member of the Board of Trustees, presided. Council members present were Dr. Roger I. Lee, President of the American Medical Association, and Dr. Louis H. Bauer, member of the Board of Trustees and the Council. The speakers were Mr. Jay Ketchum, executive vice president of Michigan Medical Service and chairman of the Advisory Committee on Prepayment Medical Care Plans of the Council, Dr. Louis H. Bauer, Major Gen. George F. Lull, General Manager of the American Medical Association, Dr. Joseph S. Lawrence, director of the Washington Office of the Council, Dr. Fritz Arestad, assistant secretary of the Council on Medical Education and Hospitals, Dr. W. W. Bauer, director of the Bureau on Health Education, and Dr. C. Charles Burlingame, chairman of the Committee on Public Education, American Psychiatric Association, and chairman of the Committee on Public Relations of the Connecticut State Medical Society.

As President of the American Medical Association, Dr. Lee opened the meeting with a few short but pertinent remarks on the phases through which public movements seem to go—the emotional phase, the political phase and the reasoning phase. 'It seems to me," commented Dr. Lee, ' that we have been through two of these phases, the emotional phase and I believe and trust we are emerging from the political phase, and we now come to the last phase, which is the intelligent rational phase in which hard thinking is very much in order. And that, I take it, is what the Council on Medical Service and Public Relations is going to do."

*Progress of Voluntary Medical Care Plans.*—Mr. Jay Ketchum called attention to the rapid growth in both enrolment and the number of plans during the twelve months that ended in June 1945. Within this period the number of plans jumped from thirty-five to fifty-three and the enrolment from around 975,000 to over 2,500,000. The voluntary plan," said Mr. Ketchum, 'has come out of the experimental stage. We know it will work. During the past five years a whole generation and more of discussion, of planning and of hope have borne fruit.'

*Fourteen Point Constructive Program.*—Dr. Louis Bauer gave a short review of the A. M. A. Fourteen Point Constructive Program. 'A great weakness" he said, 'lies in our county societies. They have waned in influence and are poorly attended. Men do not come out and learn these things. One of the prime essentials in any program we have, he went on, 'is that we must revive county societies and get men to take an interest in what pertains to the profession as a whole.' Dr. Bauer pointed out the relative importance of correct food, adequate housing and decent clothing in a general health program. He brought out the absurdity in trying to legislate a nation into health and urged education of the public and the doctors. "We must," he said, 'impress every doctor in the United States with the necessity of getting out and putting his shoulder to the wheel on any program to make it a working realization.'

Following Dr. Bauer's talk, representatives of various states were called on to report on problems or programs in their states.

*The Returning Veteran and the A. M. A.*—Dr. Lull presented the problems of the doctors returning from military service and the efforts of the American Medical Association in assisting them in their return to practice. "As you know," said Dr. Lull, "The American Medical Association saw fit to establish a Bureau of Information. This bureau was to furnish the returning medical service man with places where he could go to practice and information about residencies and internships, and where there were chances of postgraduate education. In Chicago for a time we interviewed ten to thirty veterans a day. This isn't the proper level to furnish these men this information. It is all right for general overall information, but the county and the state level should give this information."

He went on to say " the returning service man is faced with many problems. Problems differ in various parts of the country. We have circularized various states and we find that problems are different and that each state will do different things."

Dr. Lull also spoke of the personal problems of returnees, of a place to live, of office space, of clothing. On these problems the veteran will need the help of local medical men. "For their problems," he said, "there are two places they hold blamable. One thing, however, that is of great importance to returning service man is that he wants to talk over his future with some one he can trust and some one who can give advice. Many state secretaries have done a fine job in this. The personal approach to these men makes them feel they are part of the profession."

*The Washington Front.*—Dr. Joseph S. Lawrence introduced his subject with the question most often asked of him, "What is happening in Washington." He then gave a report of the service the Washington office has rendered to Congressmen.

Brief analyses were made of a number of bills, with comments as to various groups supporting or opposing them. "We recognize," he said, "that in certain areas of the United States medical services may not be readily available, and we are endorsing the most logical method of overcoming that defect that has presented itself, namely the enactment of the Hill-Burton hospital construction bill and by the way this bill has passed the Senate and is now before the House Committee on Interstate Commerce. Hospitals are naturally the center of medical activities, and it is hoped that the establishment of hospitals in areas where physicians are too few will attract more physicians and other medical personnel. For the success of this program there must be disengaged physicians willing to locate in the vicinity of the hospital, and the people of the community must give it their full support. "

'One wonders," he continued, "why the bill does not apply itself more directly to the economics of the problem rather than to the professional phase. Under the New Zealand plan the government does not propose to provide medical care but rather to aid the citizen pay his bill. By agreement with the physicians, a national fee schedule was adopted including every type of service. The government agrees to refund to the patient the amount of every medical charge as computed on the national fee schedule. The patient makes his private contract with the physician of his own selection and pays him more than the schedule from his own resources if he cares to do so."

*The Hill-Burton Bill and the Hospital System.*—Dr. Fritz Arestad gave a detailed analysis of this bill, which is supported by the hospital associations, Protestant and Catholic, and the American Medical Association. He divided the bill into four principal parts (*a*) purposes, (*b*) surveys and planning, (*c*) construction of hospitals and related facilities and (*d*) a section of miscellaneous items. He explained the provisions of each part and interpreted their significance in terms of need.

*Cooperative Community Relationships.*—Dr. W. W. Bauer spoke on this subject and stressed the importance of carrying the point of view of the medical profession to governmental agencies and the many lay organizations not only in the field of health but also those we do not ordinarily think of as health agencies, such as the American Camping Organization, Parents and Teachers Associations and Federated Women's Groups.

"One of the things constantly brought to my attention," said Dr. Bauer, "is that the American people are tremendously fond of doctors as individuals but not of medicine in organized aspects. People who have great confidence in their own physicians are rather antagonistic to county societies. We have not as a profession taken even time in the past to counteract the influence of our enemies by developing in the community those natural positions which should be ours."

Dr. Bauer emphasized the importance of leadership by the local medical society in community health matters and went on to say "All over the country there are being organized community health councils from informal groups of people getting

together without much organization to health councils we find in greater cities where they have a considerable headquarters staff These councils usually have some representation from the county medical society It seems to me of great importance that where such councils do not exist they should be formed on the suggestion of the county medical society"

Dr Bauer commented on the inadequacy of the present school health programs and pointed out that this should be one of the principal objectives of attack in the immediate future

Dr Oliver T Stringfield of Stamford, Conn, one of the regional chairmen of the American Academy of Pediatrics, read a resolution of the American Academy of Pediatrics adopted at its annual session in Detroit, Jan 15 to 18, 1946 Dr Reginald Fitz, president of the Massachusetts Medical Society, discussed various aspects of the Hill Burton bill Dr Walter Phippen of Salem, Mass, gave an account of the activities along this line in Massachusetts

*The Job of the State and County Societies in Medical Public Relations*—Dr C Charles Burlingame gave an extremely interesting discussion on the subject of Medical Public Relations

Public relations," he said, "is a field with which doctors are relatively unfamiliar, but the time has come now that we must unite in a solid front, standing up for our own principles to maintain our dignity and ethical standards and to preserve the individual independence which we value so highly

" Unless the doctors themselves are acutely aware of the principles and beliefs of organized medicine we are bound to lose ground to selfish groups"

He described the subject of public relations under the headings "(*a*) individual personal contact, (*b*) contact with cohesive groups, i e from the speakers' platform and participation in civic affairs, (*c*) the printed word, i e newspapers, magazines, pamphlets and books, and (*d*) the radio" Summing up his talk, Dr Burlingame spoke of the efforts in Connecticut calling on some of his personal experiences for descriptive material

# Medical Legislation

## STATE LEGISLATION

### Massachusetts

*Bills Introduced*—H 1822 proposes that any applicant for a license to practice a profession who has served in the armed forces of the United States during World War II shall be subject only to educational and experience qualifications required prior to Sept. 16, 1940

To make awards give prizes grant scholarships publish reports and engage in research

To accept and administer gifts donations and bequests whether of money personal property or real estate and otherwise to accumulate administer and disburse funds to advance or achieve any of the afore stated purposes

The four colleges participating in the program of the Texas Medical Center will be Baylor University which at this time is constructing a $2 000 000 school of medicine to be completed in December the University of Texas, which has announced a $6 250,000 building program for the center the University of Houston which will administer the Central School of Nursing, and the Rice Institute, which will cooperate with the units of the center in research A number of hospitals will be located immediately within the confines of the center Hermann Hospital which has received bids on a large addition to its present building in the center and on a professional building for doctors and dentists practicing in the center with additional plans for an affiliated urologic hospital a children s hospital in association with the Shrine Arabia Temple a psychosomatic pavilion and a maternity pavilion the M D Anderson Hospital for Cancer Research, jointly supported by the Anderson Foundation and the University of Texas in cooperation with the American Cancer Society the Cancer hospital was made a state institution by the forty-seventh legislature and in this institution unlimited clinical and fundamental research and treatment will be carried out in cooperation with the University Medical Branch, the main university the dental school and other units of the center, the Methodist Hospital for which plans for a new building to cost $3 500 000 are nearing completion St. Luke's Episcopal Hospital which will be constructed in the center at a cost estimated at $2 500 000 a tuberculosis hospital to be constructed in the center as a large, modern institution to replace the present institution operated by the city of Houston and the county of Harris The important addition of a marine hospital is expected to be announced for the center by the United States government in a few weeks The United States Naval Hospital now under construction at a cost of $12 000 000 is only two blocks from the center and will cooperate in its program Another government hospital to be located within walking distance of the center is the $8 000 000 Veterans Hospital The Convalescent Hospital and the Hospital for Chronic Diseases and the Aged for which plans are under discussion and the Medical Center Central Clinic, which will be an important and integral part of the entire program will bring the total number of beds to well over 2 500 Hospitals located elsewhere in the city of Houston but which have made offers of close cooperation to the center board of trustees, will add an additional 1 700 beds to the grand total Under the center s plan of operation each of these hospitals will participate fully in education and research Each institution will maintain its separate identity and management but in joining in the center program each commits itself to a unified teaching and research program The units of the University of Texas will be the M. D Anderson Hospital for Cancer Research and the School of Dentistry Preceptorial training for undergraduate medical students with all hospital facilities in the center available for students, with special assignments to a receiving center and outpatient department a postgraduate and graduate school of medicine a school of public health and training courses for all public health workers and an institute of geographic medicine Additional plans for the Texas Medical Center call for the establishment of an Institute of Biological and Pathological Research and the operation of a Central Medical and Diagnostic Clinic covering the admission examination diagnosis and distribution of all indigent patients who are admitted to the center This clinic will house a central service and medical record bureau which will handle all phases of this program making available to all medical students a wealth of material being wasted under present unorganized conditions The Houston Academy of Medicine has made plans for a medical library in the center and in connection therewith will operate a training school for graduate librarians for certificate in individual medical library practice In addition to a broad library program, the academy of medicine building will provide lecture and meeting rooms Through cooperation of the Baruch Foundation for Physical Medicine facilities may be provided in the Texas Medical Center for rehabilitation of postwar and industrial injuries Dr Ernest W Bertner, Houston is president of the self-perpetuating board of trustees of the Texas Medical Center John H Freeman attorney and member of the Anderson Foundation is vice president Col James Anderson is treasurer and Frederick C Elliott, dean of the University of Texas Dental Branch, is secretary Other members are Jesse H Jones, Mrs Oveta Culp Hobby Col W B Bates also a member of the Anderson Foundation Bishop Clinton S Quin Hines H Baker Ray L Dudley Leland Anderson Horace M Wilkins, also a member of the Anderson Foundation and H R Cullen philanthropist whose gifts were largely responsible for the new buildings, which will house every hospital in the center

Hermann Hospital—one unit in new medical center

## VIRGINIA

**Personal**—Dr Henry M Snead Petersburg has been appointed coroner of Petersburg succeeding Dr Walter L L Barnes resigned

**Changes in State Health Department.**—Dr Benjamin R Allen formerly of Suffolk recently released from the army, was appointed director of the bureau of communicable diseases Virginia Department of Health, Richmond effective April 1 Dr Edgar C Harper Richmond director of tuberculosis outpatient service and the crippled children s bureau resigned effective May 1 to become assistant chief tuberculosis control program fourth district Veterans Administration Dr Clifford E Waller Leesburg health officer of Loudoun County, resigned effective April 1

**Changes in Health Personnel**—Dr Nelson Podolnick Fairfax resigned April 1 as health officer of Prince William Fairfax and Stafford counties to enter private practice in Falls Church——Dr Edward M Holmes Jr Richmond on terminal leave from service in the army has returned to his former position as director of the division of venereal diseases Virginia Department of Health Dr Holmes had held the position from September 1939 to June 1942, when he entered service.

## WISCONSIN

**Executive Assistant Named for State Society**—On March 18 Mr Ralph F Weber, Milwaukee, business manager of the Milwaukee County chapter, American Red Cross, joined the staff of the State Medical Society of Wisconsin as an executive assistant to aid in developing the society's health insurance programs, including "The Wisconsin Plan," the farm security program in Price and Taylor counties and other related projects For ten years prior to his joining the Red Cross Mr Weber had been assistant executive secretary of the Medical Society of Milwaukee County

**The Jackson Clinic Postgraduate Meeting**—The Jackson Clinic postgraduate meeting will be held in Madison May 16-17 with Dr Karl A Meyer, Chicago, as the guest speaker The clinical interpretations of the basal metabolic rate and of laboratory tests will be discussed The program will also include round table discussions Among the speakers on the program will be

Drs Claude F Schroeder Princeton and John A Hurlbut Madison, Demonstration of Allergy Tests Significance of the Tests
Dr Addie M Schwittay Madison The Rh Factor
Dr Donald L Dickerson Madison Diagnosis and Treatment of Sterility
Dr Russell Jackson Jr Madison Diagnosis of Cancer of the Breast.
Dr George H Ewell Madison Lesions of the Genitourinary Tract
Dr Luther E Holmgren Madison Treatment of Varicose Veins
Dr Arthur C Stirling Madison Recent Developments in Orthopedics.
Dr *Arnold S Jackson Madison Recent Developments in Surgery*
Dr James A Jackson Madison Cancer of the Colon
Dr Margaret J Prouty Madison Recent Developments in Pediatrics
Dr Johanna Christine Thelen Madison, Problems in Gynecology
Rachael Weirich, Problems in Dietetics
Drs. Reginald H Jackson Jr Michael F DeSalvo John H Dix and Elmer J Hawkins all of Madison Case Presentations

## GENERAL

**Neurologic Board Candidates Return to Prewar Status**—At a meeting in Nashville, April 1, the American Board of Neurological Surgery voted that in the future no candidate will be examined until he has complied with all requirements of the board both as to training and practice but invites prospective candidates to submit their qualifications to the board when their period of training is completed and before they have begun their period of practice. During the war, in order to cooperate with the surgeons general of the army and navy in the classification of specialists, the American Board of Neurological Surgery permitted applicants whose training was satisfactory to take their examination before complying with the requirement of two years' independent practice of neurologic surgery In no instance, however, was the board's certificate issued until all requirements had been fulfilled

**Cancer Society Reorganized.**—The American Cancer Society, which was reorganized early in 1945 (THE JOURNAL, April 28, 1945 p 1141), has announced another reorganization to permit its operation by its constituents, thus allowing for a closer relationship by the parent body and the state groups The organization adopted a new set of by-laws and will be henceforth "truly national in scope," it was reported Corporation papers have been filed under the laws of New York, and the changes in the by-laws transform the board of directors from a group of random choice electees to a board of fifty-six members, half of whom are selected at large and the other half from the seven geographic regions comprising the society Dr Frank E Adair, New York, was reelected president of the society and Theodore R Gamble, chairman of the board of the American Theatre Association, Portland, Ore, chairman of the reorganized board of directors He succeeds Eric A Johnston, who was unable to accept reelection

**Ear, Nose, Throat Meeting**—The fiftieth meeting of the American Laryngological Rhinological and Otological Society, Inc, will be held at the Drake Hotel, Chicago, May 27-28, under the presidency of Dr Albert C Furstenberg, Ann Arbor Among the speakers will be

Dr Dean M Lierle, Iowa City The Use of Oral Penicillin in Otolaryngology
Dr Terence Cawthorne London England Ménière's Disease
Dr James H Maxwell Ann Arbor Chronic Proliferative Osteomyelitis of the Frontal Bone
Joseph A Sullivan Toronto Ontario Canada, A Statistical Analysis of an Audiometric Survey in the Royal Canadian Air Forces
Dr Oliver E Van Alyea Chicago Maxillary Sinus Drainage
Dr Murdock S Equen Atlanta Magnetic Removal of Foreign Bodies from the Food and Air Passages
Drs. Fred Z Havens and John R McDonald both of Rochester Minn, Pathologic Study of the Malignant Tumors of Glandular Origin of the Nose Throat and Mouth.
Dr Kenneth M Day Pittsburgh Appraisal of the Fenestration Operation Experiences with 100 Cases
Dr Chevalier L. Jackson Philadelphia Laryngocele
Dr Edmund P Fowler Jr New York Pure Tone Group Audiometry
Dr Arthur W Proetz, St Louis, Nasal Physiology in Relation to the Common Cold.
Dr Daniel S Cunning New York Tonsillectomy and Poliomyelitis.

**American Therapeutic Society**—The forty-seventh meeting of the American Therapeutic Society will be held at the Hotel Traymore, Atlantic City, May 11-12, under the presidency of Dr Joseph F Borg, St Paul Among the speakers will be

Dr Richard Kovacs New York The Present Status of American Spas
Dr Noah P Norman New York, Soils, Food and Health
Dr Oscar B Hunter Jr Washington D C Correlation of Laboratory Findings with Therapy in Epidemic Hepatitis
Drs David I Macht and Marcus Ostro Baltimore, An Experimental Approach to the Therapy of Pemphigus.
Dr Harvey B Haag Helen J Ramsey Ph D and N W Pinschmidt all of Richmond, Va, Alcohol Barbiturate Synergism
Dr Daniel L. Sexton St Louis Thiouracil—Clinical Evaluation Following Two and One Half Years Experience
Dr Frank W Konzelmann, Atlantic City Clinical Significance of the Rh Factor as of Today
Drs Ernest A Spiegel Mona Spiegel Adolf and Henry T Wycis Philadelphia Recent Studies in Cerebral Trauma
Drs. Harry E Bacon, Philadelphia and Samuel A. Linde Washington D C. The Surgical Treatment of Diverticulitis
Dr Kenneth M Lewis New York, The Use of Penicillin in Surgical Infection
Dr Robert E Fricke, Rochester Minn Uses of Radon Ointment
Dr Francis M Pottenger Monrovia, Calif, Difficulties in Physical Examination of the Chest
Dr David Salkin, Hopemont, W Va Postmortem Pneumothorax
Raymond A Kelser D V M, Philadelphia Brucellosis in Man and Animals
Dr Nathan S Davis III Chicago The Treatment of Hypertensive Cardiovascular Renal Disease with Ascorbic Acid Riboflavin and Vitamin B Complex

## LATIN AMERICA

**Health Activities in Latin America**—*Inter-American Congress on Radiology*—The second Inter-American Congress of Radiology, originally scheduled to be held in January and later postponed on account of transportation difficulties, will be held in Havana, November 17-22 Headquarters are at the Hotel Nacional Radiologists of the United States and Canada desiring to present papers at the congress should communicate promptly with Dr James T Case, chairman, in care of the American College of Radiology, 20 North Wacker Drive, Chicago 6 Dr Jose F Merlo Gómez, Argentina, is president of the congress and Dr Pedro L Fariñas, Havana, president-elect.

*Special Society Election*—At a recent meeting of the Minas Gerais Society of Leprology Dr Orestes Diniz was elected president, Prof Olinto Orsini de Castro vice president, Dr Antonio Carlos Horta secretary and Dr Josefino Alexo treasurer

## FOREIGN

**Second Reading Approved for Health Bill**—The House of Commons approved the second reading of the national health service bill today by 359 votes to 172 after three days of debate, according to the Chicago *Sun* By this vote the House decided that Britain is to have a system of socialized medicine beginning at the end of next year, with all medical services of every description provided free of charge to the public, hospitals administered and financed by the government and doctors paid salaries and fees from the government The bill now goes to the committee where minor modifications may be accepted but no major change or rejection of the bill now is possible Under the bill the practice of medicine for private fees will still be permitted for those who are willing to pay fees for extra service, but it is doubtful whether this will take place on more than a very small scale The organized medical profession demonstrated its dislike of the bill at a noisy meeting of the British Medical Association, which ended its second day after passing numerous resolutions condemning the bill in general Only five of the three hundred doctors who supported the motion approved the "general framework" of the bill The bill enjoyed the support of the Socialist Medical Association, however, and the delegates to the British Medical Association convention recognized the inevitability of their position to the extent of passing several resolutions offering constructive amendments One such amendment suggested that the system be financed out of compulsory health insurance based on ability to pay, as well as out of taxes Another proposed that expectant mothers be allowed to choose their own doctors and a third asked for government regulation of the sale and advertisement of "patent medicines"

---

## CORRECTION

**Incorrect Name**—A news item in THE JOURNAL, March 30, page 885, announced that Dr Milton B Plotz, Brooklyn, was executive secretary of the International and Spanish Speaking Association of Physicians, Dentists and Pharmacists. Dr Plotz writes that this is an error and that he does not hold office in this or any other medical organization

# Deaths

**Simon Flexner** ⊕ renowned pathologist and former director of the Rockefeller Institute for Medical Research, died May 2 in the Presbyterian Hospital, New York, aged 83

Dr Flexner was born in Louisville, Ky, March 25 1863 He was educated in the local public schools and graduated at the University of Louisville Medical Department in 1889 He did postgraduate work at Johns Hopkins University School of Medicine Baltimore and in Strasbourg, Berlin and Prague and at the Pasteur Institute From 1895 to 1898 he was associate professor of pathology at Johns Hopkins and professor of pathologic anatomy from 1898 to 1899, when he went to the University of Pennsylvania School of Medicine Philadelphia, to serve until 1903 as professor of pathology director of the Ayer Clinical Laboratory, 1901 to 1903 and pathologist at the University Hospital and the Philadelphia Hospital 1900 1903 He joined the Rockefeller Institute for Medical Research as director of laboratories in 1903 a position he held until 1935, when he became director emeritus having served as director since 1920 He was Eastman professor at the University of Oxford in 1937 and 1938 He had been a colonel in the Officers' Reserve Corps of the U S Army, serving as lieutenant colonel in the medical corps of the U S Army in 1917, becoming in 1919 a colonel and assistant surgeon general of the U S Public Health Service. **Edgar Herbert Earl,** Jamaica N Y, Long Island College Hospital, Brooklyn 1908 died January 20, aged 82, of diabetes mellitus and cerebral arteriosclerosis

**John A Eason,** Leapwood Tenn, Memphis (Tenn) Hospital Medical College, 1903 died December 30, aged 80

**Oliver Van Auken Emery,** Washington, D C, Columbian University Medical Department Washington, 1902, also an attorney, for many years associated with the department of internal revenue, died in Port Jervis N Y, January 7, aged 76 of heart disease.

**Ella Thompson Fast,** Paulding Ohio, Cincinnati College of Medicine and Surgery, 1897, died December 31, aged 74

**Filip August Forsbeck,** Oconomowoc, Wis the Hahnemann Medical College and Hospital, Chicago 1895 fellow of the American College of Surgeons served during World War I formerly member and secretary of the state board of medical examiners, at one time a member and president of the staff of St. Mary's Hospital in Milwaukee, died January 18, aged 72, of carcinoma of the bladder

**Charles Hughes Fortner** ⊕ Coffeyville Kan, University Medical College of Kansas City Mo 1904 in 1941 named head examining physician for the Selective Service Board formerly associated with the Coffeyville General Hospital division surgeon for the Missouri Pacific Railroad, died January 11, aged 73, of hypertension

**Herman J Friedman** ⊕ Rock Island Ill Chicago College of Medicine and Surgery, 1912, died January 31, aged 71, of rheumatic heart disease

**Ward Anderson Fritz,** Wooster, Ohio, Western Reserve University School of Medicine, Cleveland, 1928, member of the American Medical Association, interned at the City Hospital in Cleveland, served a term on the school board a major in the medical corps Army of the United States, during World War II, began active duty on Oct. 19, 1940 and was relieved from active duty in 1945 died January 19, aged 46, of coronary thrombosis

**Leon J Gibson,** Vassar, Mich, University of Michigan Homeopathic Medical School, Ann Arbor, 1904, served overseas during World War I, died January 31, aged 70 of cerebral hemorrhage.

**Olin Farris Gober** ⊕ Temple Texas University of Texas School of Medicine, Galveston 1905 fellow of the American College of Physicians, physician in charge of the Gulf, Colorado and Santa Fe Hospital, died January 26 aged 67, of coronary sclerosis

**John Newton Goode,** Saranac Lake, N Y, New York Homeopathic Medical College, New York, 1903, died January 23, aged 72, of arteriosclerosis

**Florence Smith Goodhue,** Cardington Ohio Homeopathic Hospital College, Cleveland, 1884, died January 2, aged 84, of influenza and a fractured hip, received in a fall

**Hedley C W Graham,** Rochester, N Y, Queen's University Faculty of Medicine Kingston Ont, Canada 1889 died in the Rochester State Hospital January 12, aged 83, of chronic myocarditis

**Cecil Charles Grant** ⊕ Cedar Falls, Iowa, Chicago College of Medicine and Surgery 1914, specialist certified by the American Board of Otolaryngology on the staff of the Sartori Memorial Hospital where he died January 14, aged 58, of hemorrhagic purpura

**James Grieve,** Perth Amboy N J, Long Island College Hospital Brooklyn 1921, member of the American Medical Association on the staff of the Perth Amboy General Hospital, where he died January 27, aged 57, of coronary thrombosis

**John Thomas Hairston** ⊕ San Antonio Texas University of Texas School of Medicine, Galveston, 1928, fellow of the American College of Surgeons, died in the Physicians and Surgeons Hospital January 24, aged 42, of carcinoma of the rectum

**Edward Everett Hamer** ⊕ Carson City, Nev, Kentucky School of Medicine, Louisville, 1906 since 1927 state health officer for Nevada, past president of the Nevada State Medical Association past secretary of the Nevada State Board of Medical Examiners, delegate from Nevada to the American Medical Association at the 1935 special session past district surgeon for Southern Pacific Railroad, died April 13, aged 68, of cardiac failure.

**Walter Addison Hancock,** Fairfield Ill, Marion Sims College of Medicine, St Louis, 1895, member of the American Medical Association, died in the Deaconess Hospital Evansville, Ind, January 16, aged 74, of cerebral hemorrhage

**William Davis Harrell,** Norris City, Ill, Rush Medical College, Chicago, 1892 member of the American Medical Association, died in St Louis January 15, aged 87, of coronary thrombosis

**William Emmett Higbie,** Canton, Ohio, Medical College of Ohio Cincinnati, 1899, died January 29 aged 71, of heart disease

**William Henry Hinkel** ⊕ Tamaqua, Pa, Jefferson Medical College of Philadelphia, 1908, vice president and a director of Peoples Trust Company, died January 20, aged 60, of coronary thrombosis

**Jesse James Holes** ⊕ Mount Dora Fla, Detroit College of Medicine, 1904, member of the Michigan State Medical Society and the American Urological Association, served during the Spanish-American War and World War I, died in a hospital at Eustis, January 19, aged 73, of pneumonia

**Alexander Hood,** Birmingham, Ala. Vanderbilt University School of Medicine, Nashville, Tenn., 1900 died January 15, aged 68, of coronary occlusion

**Philip Horowitz,** Los Angeles, Columbia University College of Physicians and Surgeons, New York, 1904, served as treasurer of the International Spanish Speaking Association of Physicians, Dentists and Pharmacists, major, medical reserve corps, U S Army not on active duty, formerly on the staff of the Beth Israel Hospital in New York and an honorary fire department surgeon, died in the Cedars of Lebanon Hospital January 17, aged 64, of cerebral hemorrhage

**Herman Max Hurwitz** ⊕ Hartford Conn, Yale University School of Medicine, New Haven, 1912, member of the American Academy of Orthopedic Surgeons, consultant orthopedist at the Veterans Administration Facility, Newington, on the staffs of the Mount Sinai and Municipal hospitals, died January 16, aged 55, of coronary occlusion

**Walter Lee Jackson,** Ranger, Texas, Baylor University College of Medicine, Dallas 1917, member of the American Medical Association, served in France during World War I, on the staff of the Ranger General Hospital, for many years member of the board of trustees of the local school board serving as its president for two years, died March 13, aged 57 of coronary occlusion

**Gedney Jenks,** Hastings on-Hudson N Y New York Homeopathic Medical College and Hospital New York 1908 died January 13 aged 66, of carcinoma of the throat.

**Homer L Kindred,** Meadow Grove Neb Kansas City (Mo) Medical College, 1892, member of the American Medical Association, served as mayor member of the school board and coroner died January 22, aged 79, of injuries received when he was struck by an automobile

**Margaret W Rhode Koenig,** Waterloo Neb, John A Creighton Medical College Omaha, 1903 died January 10, aged 70, of cerebral hemorrhage.

**Louis J Krouse,** Cincinnati, Medical College of Ohio, Cincinnati, 1879 member of the American Proctologic Society, fellow of the American College of Surgeons on the staff of the Jewish Hospital, died January 20, aged 89 of heart disease.

**Roderick Gambrell Lander,** Goliad Texas Southwestern University Medical College, Dallas 1911 served during World War I for many years county health director with the Mississippi State Board of health did part time work with the Texas State Board of Health in 1941, died January 6, aged 58, of cerebral hemorrhage.

**Philip Cadwell Leavenworth,** Cleveland, Western Reserve University School of Medicine, Cleveland, 1944, served an internship and residency at the University Hospitals died February 25, aged 25 in an automobile accident.

**Abraham Aaron Levy** ⊕ New York, Cornell University Medical College New York, 1903 specialist certified by the American Board of Internal Medicine, for many years on the staff of St. Mark's Hospital, on the staff of the New York Post-Graduate Medical School and Hospital, where he died January 16, aged 69, of carcinoma of the transverse colon

**Frederick Clarence Lord** ⊕ Biddeford, Maine Medical School of Maine, Portland, 1903, on the staff of the Webber Hospital, died January 28, aged 69, of coronary thrombosis

**Benjamin Dane Luck Sr** ⊕ Pine Bluff, Ark., Jefferson Medical College of Philadelphia, 1903, chairman of the Jefferson County Board of Health interned at the St Vincent's Hospital in Birmingham Ala., fellow of the International College of Surgeons served as a member of the state board of nurse examiners, died in the Davis Hospital, January 23, aged 66, of coronary thrombosis

**William Solomon Lynch** ⊕ Lake City, S. C. Medical College of the State of South Carolina, Charleston, 1899, served during World War I, major, medical reserve corps, U. S. Army; not on active duty died December 21, aged 70

**Lyle Dee McMillan** ⊕ Mackinaw City Mich., University of Michigan Medical School Ann Arbor, 1916, at one time teacher of science in high schools in Petoskey and Hancock, Mich., spent several years in the Philippines in the U. S. civil service, served six months in France as a surgeon of the U. S. Marine Corps during World War I, died February 18, aged 56, of heart disease

**Stephen Codding Mason** ⊕ Menominee, Mich., Rush Medical College, Chicago, 1905, served as president and vice president of the Upper Peninsula Medical Society, member of the board of education, on the staff of St Joseph's Hospital, where he died January 10, aged 65, of coronary thrombosis

**William Harvey Mercer** ⊕ Taylorville, Ill., Marion Sims College of Medicine, St Louis, 1898 past president of the Christian County Medical Society, died in the Barnes Hospital, St Louis, January 23, aged 75, of carcinoma of the stomach

**Elbert Ervin Munger** ⊕ Spencer, Iowa, State University of Iowa College of Medicine, Iowa City, 1894 born in Lima, Ohio, June 23, 1867, for many years member of the Clay County Insanity Commission, author of a county hospital bill, which was enacted into law, past president of the Clay County Medical Society, member of the county draft board during World War I, on the staff of the Spencer Municipal Hospital, died March 14, aged 78, of virus pneumonia

**Henry Garrett Munson** ⊕ Philadelphia, Jefferson Medical College of Philadelphia 1892, since 1923 secretary of the Philadelphia County Medical Society, assistant secretary of the Medical Society of the State of Pennsylvania, served during World War I on the staff of the Jefferson Hospital and the Presbyterian Hospital, where he died April 9, aged 76

**William Carl Newell** ⊕ Ottumwa, Iowa, Marion-Sims College of Medicine, St Louis, 1899 Barnes Medical College, St Louis, 1900, fellow of the American College of Surgeons, on the staffs of the Ottumwa and St Joseph's hospitals, died January 18, aged 69, of carcinomatosis

**Walter Aaron Palmer** ⊕ Castle Rock, Colo., Rush Medical College, Chicago, 1892 associate member of the Colorado State Medical Society, medical examiner for the selective service board during World Wars I and II, participated in the work of the city council, served as city and county health officer and physician, an officer of the First National Bank of Douglas County, died March 31, aged 78, of carcinoma

**Charles Joseph Vincent Redding,** Owego, N. Y., Cornell University Medical College, New York, 1908, member of the American Medical Association, died in the Robert Packer Hospital, Sayre, Pa., January 31, aged 66, of pneumonia and acute leukemia.

**Daniel James Rudasill,** Kingwood, W. Va., Medical College of Virginia, Richmond, 1905, died March 29, aged 66, of coronary thrombosis

**Robert Thomas Rudd,** Fulton, Ky., Eclectic Medical Institute, Cincinnati, 1896, died in the Fuller Gilliam Hospital, Mayfield, January 28 aged 76, of lobar pneumonia

**Lida Burgess Russell,** Denver, Denver Homeopathic College, 1907, died in St Luke's Hospital January 12, aged 84, of carcinoma of the stomach

**James O St Dizier** ⊕ Walls, La., Medical Department of Tulane University of Louisiana New Orleans, 1900, parish coroner, died January 17, aged 65, when the automobile in which he was driving was struck by a train

**Louis Van Sams** ⊕ Denver, University Medical College of Kansas City, Mo., 1903 served during World War I, formerly medical director of the Remington Arms Plant, just a week before his death had been made medical director of the Denver General Hospital, where he died January 20, aged 65, of acute disseminated tuberculosis

**J Clarence Sharp,** New York, Bellevue Hospital Medical College, New York, 1886, member of the American Medical Association specialist certified by the American Board of Otolaryngology, honorary police surgeon on the staff of the Manhattan Eye Ear and Throat Hospital, where he died January 17, aged 85, of pneumonia

**Anna P Sharpless,** Bala Cynwyd Pa., Woman's Medical College of Pennsylvania Philadelphia, 1889, served on the staff of the Western Philadelphia Hospital for Women, died January 27, aged 82, of lymphatic leukemia

**Harry Laurence Stevens,** New Bedford Mass., Baltimore Medical College, 1891, member of the American Medical Association, formerly physician to the overseer of the poor and city physician, served as a member of the state board of registration in medicine, died January 29, aged 75, of hypertensive heart disease

**Samuel Stevens,** Mendon, Mich., College of Physicians and Surgeons of Chicago School of Medicine of the University of Illinois, 1894, died January 6, aged 77, of carcinoma of the right lung

**Chester T Stewart,** Buffalo, College of Physicians and Surgeons, Baltimore, 1882 died January 25, aged 84, of cerebral thrombosis

**Fred Elliston Strout,** Gardiner, Maine Medical School of Maine, Portland, 1890, past president of the chamber of commerce, died December 1, aged 78, of angina pectoris

**William Franklin Sult,** Gilman, Iowa, Iowa Eclectic Medical College, Des Moines, 1892, member of the American Medical Association, died January 14, aged 77, of heart disease.

**Eugene Talmage,** Los Angeles, Hahnemann Medical College and Hospital of Philadelphia, 1891 died December 12, aged 79, of adenocarcinoma of the prostate

**Jackson Taylor** ⊕ Coatesville, Pa., Jefferson Medical College of Philadelphia, 1904, fellow of the American College of Surgeons, chief surgeon, Coatesville Hospital, died January 20, aged 69, of coronary occlusion

**Leslie Allin Turner** ⊕ Brooklyn, Columbia University College of Physicians and Surgeons, New York, 1898, formerly associated with the department of health of New York City, died January 19, aged 70, of coronary occlusion

**Harry Fuller Waite,** Hollywood, Fla., University of the City of New York Medical Department New York, 1897, died in Miami, January 26, aged 73, of epithelioma of the right eye and face

**Charles Norton Warner** ⊕ Litchfield Conn., Jefferson Medical College of Philadelphia, 1896, president of the Litchfield Savings Society, past president of the Litchfield County Medical Association, on the staffs of the Charlotte Hungerford Hospital, Torrington, and the Waterbury Hospital, Waterbury, died January 27, aged 80, of arteriosclerotic heart disease.

**Job Harry Weeks,** Philadelphia, Jefferson Medical College of Philadelphia, 1886, died January 25, aged 82, of mitral stenosis and pulmonary tuberculosis

**John William West** ⊕ Narka, Kan., Lincoln Medical College of Cotner University, 1897, died in January, aged 72, of chronic myocarditis

**Martin Daniel Westley** ⊕ Cooperstown, N. D., Jefferson Medical College of Philadelphia, 1904, served as a captain in the medical corps of the U. S. Army during World War I, with the 26th division and participated in the Meuse, Argonne and Chateau Thierry campaigns, examining physician for Griggs County during World War II, member of the North Dakota State Committee on Maternal and Child Welfare, died in the Northwestern Hospital, Minneapolis, March 28, aged 72, of uremia following transurethral surgery

**Milton Cayce Wiggins,** Tucson, Ariz. University of Tennessee College of Medicine, Memphis, 1915, member of the American Medical Association, Tennessee State Medical Association and the Southeastern Surgical Congress, fellow of the American College of Surgeons, served during World War I, died January 12, aged 55, of coronary disease.

**Gustave Windesheim,** Kenosha, Wis., Northwestern University Medical School, Chicago, 1891, member of the American Medical Association, past president of the State Medical Society of Wisconsin, served as member and president of the state board of health and health commissioner of Kenosha, a founder and for many years trustee of the Wisconsin Anti-Tuberculosis Association, for many years visiting physician at the Willowbrook Sanitarium, died in a local hospital January 19, aged 91, as the result of a fall

**Firman M Wurtsbaugh,** Richwood, Ohio, Eclectic Medical Institute, Cincinnati, 1908 member of the American Medical Association, past president of the Union County Medical Society, past president of the Union County Board of Health served as county health officer, died in the Mount Carmel Hospital, Columbus, January 22, aged 72, of intestinal perforation and peritonitis

### The Proposed National Health Service

At largely attended meetings of the medical profession, organized by the British Medical Association throughout the country strong opposition is being manifested to the government bill for a national health service At the house of the British Medical Association in London the audience not only packed but overflowed the great hall Dr Charles Hill delivered an address in which he referred to the bill as containing both proposals which should be commended and proposals which should be condemned For example, the proposal to plan all hospitals, council and voluntary, over natural hospital regions was welcomed, provided the regional boards were properly constituted. Four main issues were raised by the general practitioner proposals to abolish good will in practices, to require practitioners entering the public service in future to secure the permission of a central committee, to remunerate general practitioners in part by salary and to organize general practice from health centers The profession, which through its voluntary machinery had assumed the responsibility for the recruitment of doctors to the forces during the war, was capable of solving any problem of distribution remaining after the introduction of a comprehensive medical service Inducement would suffice and direction was objectionable

Dr Hill advocated that general practitioners should be remunerated by capitation fee in proportion to the number of people who chose them The salaried system endangered the public's free choice. Health centers were a useful conception worthy of widespread experiment. What the doctors needed was centers which could provide diagnostic and other aids, not merely places where a large number of people could collect in municipal premises The bill could be amended so as to ensure the public s freedom and the cooperation of the medical profession They were waiting for an indication from the minister whether he was prepared frankly to discuss the proposals with the only people who could make them work—the doctors The medical profession did not want to be steamrollers into any form of service it felt to be contrary to the public interest

### Antituberculosis Legislation

The Government of Northern Ireland bill which makes better provision for the prevention and treatment of tuberculosis, marks an advance in existing plans A tuberculosis authority is to be set up for the whole country which will make provision for the accommodation and treatment of tuberculous persons, for the detection of cases and for preventing the disease by educational and other methods, including courses of instruction for medical students, doctors and nurses This authority will be able to purchase or lease land, acquire or construct buildings to be used as hospitals, sanatoriums, dispensaries clinics, health centers or occupational colonies It will maintain and educate tuberculous children or children who have recovered from tuberculosis or who have been in contact with infection in their homes It will train persons in methods of detecting, preventing and treating tuberculosis to that end testing apparatus and equipment, and maintaining laboratories for research The authority also may contribute to the support of any association for training nurses or to any benevolent association in line with its purpose The authority with such wide powers will have as a majority of its members nominees of the local authorities and in addition four other members nominated by the minister of health It will also be possible co-opt one or two further members The members are not to be paid any salary or fees but are to be reimbursed for expenses

Whenever a physician intimates to the authority that a person shows symptoms of a tuberculous condition, that person may be called on to be examined medically for the purpose of diagnosis The authority will also have power to require any person living in habitual contact with a person suffering from tuberculosis to be examined by a medical officer It can also apply to a court of summary jurisdiction for an order to detain any person suffering from tuberculosis of the respiratory tract if he is in an infectious state and his home circumstances are such that proper precautions are not or cannot be taken If the court is satisfied it may order the person to be kept in a hospital or institution for not more than three months, which may be renewed if the same conditions still obtain. If during the period of detention his condition improves so that there is no longer serious risk of infection, or if his home conditions become such as to permit the necessary precaution to be taken, he may be at once released from institutional control

STOCKHOLM, April 4, 1946

### Half a Million Kronor Granted to Ninety-Seven Scientists

The Swedish government Medical Research Board recently granted considerable sums of money to ninety-seven medical investigators, including professors and students, for studies of a wide variety of problems, ranging from the origin of hay fever to the conversion of proteins in the nerve cells Among the recipients were Dr C. Juhlin-Dannfelt, who for some time has been studying the pollen allergies in Sweden at the allergy clinic of Sabbatsberg Hospital in Stockholm. The clinic has been in existence for six years and has assembled a great deal of material on the grasses of this country and their relation to allergies Dr Åke Öhrström, another recipient, will use the money to continue his research into the brain metabolism involved in certain psychoses, particularly schizophrenia and manic depressive psychosis He is using radioactive phosphorus to determine the metabolism in the cells of the brain and has thus far been able to confirm that the epiphysis has a great deal of glandular activity The more practical side of his investigation is to establish whether mental diseases are due to a metabolic disturbance in the brain Dr Curt Åmark received a grant for the study of the causes of chronic alcoholism. He is working with about 700 carefully selected subjects in an attempt to determine the constitutional, social and other factors responsible for alcoholism Some of the other grants will be used for study in the United States

### Ten Year Hospital Plan for Stockholm

What to do about the shortage of hospital space in Stockholm has long been a subject of discussion among the authorities here. Dr Nils Hanson director of the city s hospitals, has now presented a plan for the building of four new hospitals with about 600 beds each which should take care of the needs of the next ten years If the plan is realized, the number of hospital beds in Stockholm will increase from the present 3,371 to 5,601, which should be sufficient for a population of 830,000 if the need for beds is calculated on the basis of 6 7 per thousand An additional 556 beds are planned for children

### "X-Ray Bus" to the Netherlands

As is probably known, Sweden is doing a great deal through its Red Cross to help alleviate suffering in Europe through gifts of food and medicine and even hospitals in the hardest hit countries. A great many undernourished children have also been brought to Sweden for care Recently the Red Cross contributed a fully equipped x-ray bus to the Netherlands X-ray examinations, chiefly of children, are to begin in Utrecht, and then the bus is to travel from city to city throughout the

Netherlands The proportion of tuberculosis among the Dutch children, which before the war was the lowest in Europe, has increased by at least 45 per cent Through the loan of this rather unique bus it is now hoped to detect and treat the disease in its early stages

### Serious Diphtheria Epidemic in Finland

The number of cases of diphtheria in Finland has been extremely high for the past few years Normally there are about 1,000 to 4,000 cases annually, but in 1945 there were 17,899 cases, of which 1,005 were fatal In Finland s armed forces between 1943 and 1945 more than 45,000 soldiers had the disease, and over 3,000 of the cases had a fatal outcome The epidemic is still severe and shows no signs of receding

### Icelandic Gifts of Cod Liver Oil to European Children

Through a Red Cross drive in Iceland, enough money was collected to purchase about 160 tons of cod liver oil to be sent to the children of Austria, Poland, Czechoslovakia and Germany A good portion of the oil has already been forwarded

RIO DE JANEIRO April 3, 1946

### Blood Chemistry of Normal Adults

Dr M Pereira de Mesquita, with the cooperation of other physicians of the blood bank service of the Instituto Nacional de Puericultura, is attempting to establish the normal values of the most important components of the blood in healthy white adults in Rio de Janeiro Three reports have been published on sugar, urea and creatinine For the estimation of blood sugar the Folin Wu method was used as modified by Andes and Northup for the photometer (Fisher s electrophotometer), 201 individuals were studied (144 males and 57 females) For the 144 males the results were minimum 73 mg maximum 119, mean value 95 1 and standard deviation 9 3 For the 57 females the results were minimum 75 mg, maximum 112 mean value 91 9 and standard deviation 10 0 Urea was determined by the Marshall Van Slyke method in 200 individuals (140 males and 60 females) For the 140 males the results were minimum 15 5 mg, maximum 45 5, mean value 30 3, standard deviation 7 2, for the 60 females the results were minimum 15 0 mg, maximum 40 2 mean value 26 2, standard deviation 6 9

### Meeting of Dietitians and Nutritionists

From April 3 to 8 the first Brazilian Congress of Dietitians and Nutritionists will be held in São Paulo under the sponsorship of the São Paulo Chemistry Association and the state Department of Health The organization committee includes Drs Nicolino Moreno, Haroldo J Reis and J Assis Ribeiro of São Paulo and Dr A Paula Rodrigues of Rio de Janeiro The subjects will be discussed in the following sections Nutrition and Dietetics, Food Hygiene and Food Control, Food Chemistry, Standardization of Food Analysis Methods and Teaching of Food Chemistry Included in the scientific contributions for presentation will be papers by Drs Francisco Albuquerque, Jose Tobias Neto, Antonio T Bragança, Pedro A Pereira Antenor P dos Santos and Paulo Andrade from the Federal District and the states of São Paulo, Bahia, Rio Grande, Sergipe, Parana and Minas Gerais

### Vital Statistics of Rio de Janeiro for 1945

Provisional data of vital statistics for Rio de Janeiro for the year 1945 show that the total number of deaths from all causes was 33,500, a crude annual death rate of 16 79 per thousand computed for a population of 1,995,000 This is slightly below the rates for the previous two years (18 50 for 1944 and 17 58 for 1943) The number of live births registered in 1945 was 42,930, corresponding to an annual birth rate of 21 52 per thousand, approximately the same as for the past two years (21 95 for 1944 and 21 63 for 1943) With 3,633 stillbirths the fetal mortality was 78 02, a rate almost identical with those of the last few years as a result of the high prevalence of syphilis in the population The number of deaths from causes related to pregnancy, childbirth and the puerperium was 277, a maternal death rate of 6 45 per thousand live births (6 65 in 1944 and 6 33 in 1943) Of these 277 deaths 78 were due to puerperal infection, or 28 16 per cent of the maternal deaths, as compared with 38 87 in 1944, 34 88 in 1943 and 46 65 in the five year period 1938-1942

The most important single cause of death was tuberculosis of all forms, with a total of 6,538 deaths (6,335 from tuberculosis of the respiratory system), or 19 52 per cent of the total of deaths from all causes, and a crude annual death rate of 328 per hundred thousand of population (326 in 1944, 325 in 1943 and 328 in the five year period 1938 1942) The mortality from tuberculosis remains practically stationary at a high level

### Brief Items

The administration of the state of São Paulo will promote the expansion and improvement of spas and climatic stations of its territory (at São Pedro, Lindoia, Serra Negra, Campos do Jordão, São José dos Campos and other places) The governor of the state has appointed a committee including Dr Clementino Fraga, professor at the University of Rio de Janeiro, Dr Aguiar Pupo, professor at the University of São Paulo, and Drs H Sampaio Correia and Nicolino Morena from the state Department of Health to study a plan of development

The American government transferred to the administration of the state of Amazonas the hospital at Manaos that the U S Rubber Development Corporation constructed and equipped for the assistance of rubber agricultural workers of that organization's plantations For some time yet, large quantities of natural rubber will be shipped to the United States, and the service of a good hospital is an important measure for the efficient production of the plantations

At the meeting of the American International Institute of Child Welfare recently held at Montevideo, Uruguay, Dr Mario Olinto, director of the National Institute of Child Health of Brazil and president of the meeting, presented several papers by Brazilian specialists and in an address reviewed child welfare work in Brazil

## TIC AND SPASM

*To the Editor* —In Queries and Minor Notes (THE JOURNAL, March 16, p 754) an opinion is asked on treatment of facial tic. First, was this case one of tic or of facial spasm? A clear distinction must be made between these two conditions, as they differ fundamentally in their nature origin, symptomatology and therefore treatment The description of the symptoms given is somewhat misleading The terms "spasm" and "tic" are mentioned simultaneously

Convulsive movements of the face appear in three principal forms spasm, tic and epileptic twitchings The last mentioned are usually associated with generalized or with focal epilepsy Tic is characterized by a sudden and abrupt contraction of one or several muscles As these are invariably always the same, they are coordinate and always executed for a certain functional purpose. Originally the movements of the tic were made for a certain good reason and under the influence of the will For example, a foreign body accidentally gets under a person's eyelid. Irritation is produced He closes and opens his eyelids He endeavors to get rid of it Finally the body is removed Normally this is the end of the trouble. But certain persons continue the reproduction of the sensation of the foreign body They will repeat the act of closing and opening the eye Gradually they forget the original trouble. The act becomes a habit and the movement becomes automatic While at the beginning the movements were logical and reasonable, now they are superfluous It is evident that we deal here with an abnormal physical phenomenon and with a mentally unstable individual That a psychic element is predominant in tic can be seen also from the singular satisfaction the person experiences from indulging in tic movements. He may make an effort to inhibit the tic, but the effort of his will is meager and short in duration The last characteristic diagnostic element of tic is the fact that the muscular contractions do not correspond to a well defined anatomic distribution of a certain nerve supply

Facial spasm does not present a reproduction of a purposeful physiologic act. It consists in a motor reaction following an irritation of any part along the spinal reflex act. It is strictly confined to the area of distribution of the facial nerve. The muscular contractions in spasm are either slow and coarse or rapid and fascicular The muscles supplied by the upper facial nerve alone may be involved, and then we observe a contraction of the frontalis and orbicularis palpebrarum muscles or else the lower facial nerve is irritated and the muscle of the lower part of the face are contracted, also the muscles of the neck on the same side. While the twitching in tic is an exaggerated normal movement, made originally with a certain object in view, in spasm on the contrary the twitching is illogical and without any reasonable expression, it does not resemble the ordinary mimicry of the face. Here the will has no cerebral inhibitory power to arrest the attack, which is the opposite in tic Spasm may occur in sleep, while tic does not Tic is a mental phenomenon Irritation of any portion of the seventh nerve or of its nucleus or else of the sensory fibers of the fifth nerve will produce a spasm through the reflex arc Irritation of the palpebral mucosa will produce a spasm of the orbicularis

In view of the different pathogenesis of the two disorders the treatment must logically differ In tic the treatment must be directed chiefly toward the patient's psyche. Psychotherapy, with continuous training to immobilize the face and regularly practiced, will eventually bring results The management of facial spasm must be totally different Among all the methods used by competent men, injections of ethyl alcohol are the most satisfactory The method consists in injecting with an ordinary hypodermic syringe into the facial nerve in the stylomastoid foramen 5 minims (0.3 cc.) of 80 per cent solution of alcohol The injection can be done without a preliminary localized anesthetic.

Of course, anatomic knowledge of the exit of the nerve from the foramen is essential As a point of departure, the end of the mastoid process can be taken The foramen is situated in front and inward of the process A successful injection means an immediate facial palsy and immediate disappearance of the spasm The palsy is not permanent. Electrical treatment of the palsied muscles may be instituted three or four weeks after the alcohol treatment The palsy usually lasts about three or four months Recurrences of the spasm will in some cases occur Repeated injections into the same nerve may be undertaken In 1 of my cases there has been no recurrence after three years

ALFRED GORDON, M.D., Philadelphia

## RADIOACTIVE PHOSPHORUS IN POLYCYTHEMIA VERA

*To the Editor* —Several weeks ago in an editorial you stated that radioactive phosphorus was the "method of choice" in the treatment of polycythemia vera We feel that such a statement is not in keeping with the judgment of many clinical investigators who have had occasion to use radioactive isotopes in therapy

Radiation therapy is highly empirical in its application When radioactive isotopes are used, it should be kept in mind that a great deal of basic information is still lacking We will mention only one example. Reinhard, Moore, Bierbaum and Kamen (*J Lab & Clin Med* **31** 107 [Feb.] 1946) point out that there is a wide discrepancy at the present time in the unit of dosage which is regarded in different laboratories as a millicurie Two well known laboratories differ by a factor of 2.4 When one considers the fact that the ultimate effect of a dose of radio phosphorus may take many weeks to appear, this factor can easily represent the difference between a therapeutic dosage and one which may result in leukopenia and thrombocytopenia with fatal termination

Radio phosphorus is already widely available, and recent developments in the field of nuclear fission should make this isotope much more available in the future If its use in therapy is adopted too enthusiastically, more widespread use will undoubtedly result in many untimely deaths We do not feel that radiation should be employed in any benign diseases in which alternative methods of control are available This is especially true in the case of polycythemia, in which control by phlebotomy presents a simple and straightforward approach Failure of this method is frequently due to the lack of appreciation of the quantity of blood which must be removed Not only is it necessary to reduce the circulating hemoglobin to the desired level, but also the reserve iron stores must be depleted In cases of polycythemia it should be pointed out that the venous hematocrit does not give the proper index of the total volume of the circulating red cells Where proper facilities are available for determining red cell volumes by the radioactive iron or carbon monoxide rebreathing technics, it is suggested that these methods be used as a guide.

## MEDICOLEGAL ABSTRACTS

**Public Hospitals Exemption from State Real Estate Tax.**—The plaintiff Fairmont Community Hospital Association, Inc, filed a petition to exempt certain of its real estate from taxes levied against it by the state. From an order finding that the real estate was not exempt from taxation, the plaintiff appealed to the Supreme Court of Minnesota

Prior to Jan 1, 1941 the building now operated by the plaintiff was operated by the Fairmont Clinic and Hospital Corporation, a private institution organized by three physicians, each of whom owned stock therein These physicians maintained their offices in the hospital, and no other physicians in the area used its facilities On January 1 the plaintiff purchased the property and commenced operations under the name of the Fairmont Community Hospital Association No cash was involved in the transaction The plaintiff s note for the purchase price, when paid, will be insufficient to take care of the unsecured creditors and stockholders of the old corporation Under a collateral agreement the preferred stockholders could apply the par value of their stock on hospital services rendered for them by the plaintiff and the plaintiff would apply such stock on its indebtedness Since 1941 the plaintiff has done business on the premises as a public hospital in accordance with the objectives expressed in its articles, namely to operate a public hospital on a nonprofit basis to furnish hospitalization to the sick and injured, to provide nursing care, to maintain a training school for nurses and to do all other acts which may lawfully be done by corporations of its class under the laws of the state. Any doctor in good standing may use its facilities No one has ever been refused admittance to the hospital No member of the corporation has made a profit of any kind from the hospital and no person has received any private gain or advantage from the earnings thereof The patients employ the services of their own physicians and the latter look to the patients rather than to the hospital for compensation. When patients are unable to pay for hospitalization, the local relief office is asked to take care of the expenses involved, including medical and surgical fees The county pays such charges The hospital extends a lower rate to the county for poor patients In 1941 and 1942 the hospital operated at a loss In 1943 there was a profit which was used in making improvements and additions to the hospital, and on Jan 1, 1944 a tax assessment for alleged 1943 taxes was levied against the petitioner's real estate. Under the Minnesota constitution "public hospitals" are specifically exempt from taxation

The district court first denied exemption on the theory that the evidence indicated a private gain to some of plaintiff's organizers incompatible with the status of a public hospital This was predicated on the fact that three of the incorporators of the Fairmont Community Hospital Association were also stockholders of the old corporation We are of the opinion, said the Supreme Court, that the petitioner was organized as a public hospital and that during 1943 it was conducted as one. Therefore it was exempt from the tax involved Under prior decisions, the court continued, a public hospital need not operate at a loss or as a charitable institution to remain eligible for exemption from taxation under the constitutional and statutory provisions referred to 'Operated for the benefit of the public" means operated without an intent to make a private profit If the profit made does not go to plaintiff's incorporators or to any individual as private gain, plaintiff must be regarded as a public hospital The record discloses that no part of such profit finds its way, by any device into the private accounts of plaintiff s incorporators, officers or trustees, and, under its articles such profit cannot be so diverted Payment to the bondholders and preferred stockholders constitutes merely payment of the purchase price of the building and equipment. Surely it cannot be, concluded, said the Supreme Court, that a corporation organized to conduct a public hospital, and operated as such, loses its tax exempt status because it uses such profits as it may derive in payment of the purchase price of its property The reduction of the indebtedness of the old corporation is merely the payment of the purchase price of its property and has nothing to do with the status of the new corporation as a public or private institution

The district court also ruled that the activities of some of the common stockholders of the old corporation who were also incorporators and trustees of the plaintiff, in continuing to maintain offices in the hospital after the transfer and in leasing out equipment owned by them to doctors using the hospital facilities, established not only a private gain to them incompatible with plaintiff s status as a public hospital but also, in substance, the control of the new institution by the controlling officers of the old We do not agree with the trial court's conclusion, said the Supreme Court. The brief period of time during which certain doctors continued to maintain their offices in the hospital should not constitute a bar to plaintiff's subsequent claim for exemption from taxation

Finally, the trial court held that the possibility of a future amendment of plaintiff's articles of incorporation so as to change it from a public to a private hospital supported the conclusion that plaintiff had not established its right to exemption as a public hospital The Supreme Court said that it did not feel that the possibility that the plaintiff at some future date might amend its articles was a factor to be considered in these proceedings Plaintiff was organized as a public hospital under the social and charitable provisions of the laws of the state Should it attempt at some future time to change its character for the benefit of its incorporators as private individuals, it would seem that the state might properly intervene to uphold whatever right the public might have in the property of the corporation.

The order of the trial court denying plaintiff's tax exemption was accordingly reversed.—*Fairmont Community Hospital Association, Inc, v State, 21 N W (2d) 243 (Minn, 1945)*

**Superior Vena Caval Syndrome**—Hussey and his associates present 35 cases of the superior vena caval syndrome observed at the Gallinger Municipal Hospital and the Georgetown University Hospital Aneurysm of the ascending aorta bronchogenic carcinoma, malignant lymphoma and carcinoma with metastasis to the mediastinum are the main causes of the syndrome Simple thrombosis of the superior vena cava is very rare. The principal symptoms and signs of the syndrome are edema and cyanosis in the upper part of the body dyspnea and dilated veins indicative of the collateral circulation Comparison of measurements of the venous pressure in the upper and lower extremities is the best method for establishing the diagnosis of obstruction of the superior vena cava This may be the only practical method for recognizing that the vena cava is partially obstructed The venous pressure in the arms is significantly higher than the femoral venous pressure The arm-to tongue circulation time may be normal in spite of the fact that the venous pressure is quite high If prolonged it is usually less than might be anticipated from the height of the venous pressure Phlebography demonstrates that obstruction of the superior vena cava is present and at times localizes the point of obstruction. In 2 cases of aortic aneurysm the superior vena caval syndrome was produced by communication between the aneurysm and the superior vena cava This condition should be suspected when the syndrome develops explosively in a patient with aneurysm of the aorta The usual features of arteriovenous communication such as thrill, bruit and an increase in pulse pressure may not be present. X-ray therapy of radiosensitive mediastinal tumors may decrease obstruction of the superior vena cava. Surgical exploration of the mediastinum may be of value in cases in which lack of evidence of the cause of the obstruction holds promise of a remediable condition such as obstruction by adhesions

**Prothrombin Time in Patients with Arteriosclerosis**—Prothrombin estimations on arteriosclerotic persons were checked with the blood of a normal person as a control Diluted and undiluted plasma determinations were checked two or three times, and the control specimen was rechecked after each series The chief advantage of Shapiro's method is that it employs both diluted and undiluted plasma for the determination of the prothrombin time In the diluted determinations a 1 8 saline solution of plasma is used The diluted prothrombin time has revealed changes in patients with coronary arteriosclerosis that have not been demonstrated by the ordinary undiluted method. This may be due Shapiro states, to an anticoagulant factor in undiluted plasma which is inactivated by dilution In diurnal studies of the prothrombin time there is a tendency toward shortening in the diluted fraction in the late hours of the night and in the early morning in patients with coronary arteriosclerosis There is no significant change in normal males Exercise apparently had no effect on the prothrombin times of the small group of arteriosclerotic patients tested Patients with coronary sclerosis and anginal syndrome do not show any especial alterations of the prothrombin time After the acute phase of coronary occlusion there is noted a trend toward shortening of the dilute prothrombin time which continues for several weeks during the period of infarction

Answers to Comments by Members of Committee on Tests for Intoxication A O Gettler —p 618

**Plumbism Punctate Basophilia in Bone Marrow**—Movitt points out that the demonstration of basophilic stippling is particularly important in the diagnosis of plumbism when proper facilities for lead determination in body fluids are not available Punctate basophilia frequently cannot be found in the peripheral blood to a significant extent but may be seen in abundance in the bone marrow

**Melioidosis**—Cox and Arbogast present what they consider to be the first case of melioidosis in the Army of the United States An American Indian soldier aged 27 was admitted to a hospital in Burma with a history of headache, fever, chills, nausea and vomiting for twenty four hours before admission The patient was acutely ill with a temperature of 102 4 F, pulse rate 86 and respiratory rate 18 The liver and spleen were palpable 2 fingerbreadths below the costal margin Repeated malarial smears failed to demonstrate parasites During the next few days scattered pustules appeared over the entire body involving especially the face chest abdomen, arms and legs except the palms and soles Some of the lesions became crusted The fever was septic in type A diagnosis of smallpox was considered The liver and spleen remained palpable, and moderate abdominal distention developed On the fifth day the patient became irrational and signs of pneumonic consolidation were present at the left base The clinical diagnosis at the time of death was generalized septicemia etiology undetermined Premortem cultures from skin pustules and blood and postmortem cultures from pulmonary abscesses blood liver and spleen were identified as Malleomyces pseudomallei The organism was a short gram negative bacillus showing bipolar staining even by means of Gram's stain The cells had the characteristic 'closed safety pin' appearance Motility was present and could be demonstrated by both the hanging drop and semisolid agar methods

**Growth of Mammalian Tumors in Fertile Eggs**—Twombly and Meisel incubated fertile white leghorn eggs for five days at 38.5 C and then inoculated the eggs with 0.5 cc of a sterile tumor emulsion. The inoculated eggs were then incubated again. Rat sarcoma R39, Bagg mouse carcinoma 755 and the RC mouse carcinoma of Taylor have been grown successfully in these eggs. The mortality of such eggs has been high, 73 per cent by the seventeenth day of inoculation, making this method a poor one for the routine growth of tumor tissue. The yolk from eggs bearing the rat sarcoma R39 did not produce sarcomas when injected into susceptible rats save in 1 instance in which the centrifuged sediment of the yolk was effective. Injection of the yolk did not confer immunity on young rats so treated. Yolk from eggs bearing either of the two mouse mammary carcinomas frequently reproduced the tumor when injected into susceptible mice. Repeated attempts to filter the tumor agent through Berkefeld N or V candles were unsuccessful.

**Inheritance of Respiratory Allergies**—Stiles and Johnston report familial atopy in a family of five generations. This family of 232 persons has been studied with regard to the inheritance of respiratory allergies, namely asthma, hay fever and bronchial disorders. The incidence of respiratory allergies was 22.4 per cent, in contrast to approximately 7 per cent in the general population. The authors think that, in studying the inheritance of atopy, perfect mendelian ratios are not likely to be obtained, owing to the complexity of both environmental and hereditary factors involved. The specific sensitivity does not appear to be inherited but rather the capacity or the predisposition to become hypersensitive. The manifestations of the symptoms are influenced by many factors and their interactions, including presence of the atopen, climate, degree of inheritance, age and sex. The reported data suggest that respiratory allergy may be interpreted as an irregular dominant character. The gene exhibits low penetrance with variable expressivity.

**Allergic Reaction Following Typhus and Yellow Fever Vaccination Due to Egg Yolk Sensitivity**—Rubin reports that allergic manifestations of angioneurotic edema, nasal blockage and tightness in the chest developed in a soldier aged 19 shortly after he received yellow fever vaccine prepared from infected chick embryos and typhus vaccine prepared from infected yolk sacs. The patient had a history of spring and fall hay fever for the past eight years and sensitivity to egg yolks since childhood. Tolerance for egg white and hypersensitivity to egg yolks was corroborated by cutaneous tests showing that egg yolk sensitivity may exist alone without concomitant egg white sensitivity. The author points out that persons sensitive to egg or chicken may develop allergic manifestations from virus or rickettsial vaccines which are grown on egg yolk sacs or chick embryos.

**Prolonged Treatment with Thiouracil**—Williams says that during the last two and a half years thiouracil has been used at his clinic at Harvard Medical School in the treatment of 247 patients with thyrotoxicosis. All patients experienced a remission of the disease, which was maintained for as long as treatment was continued. Thyroidectomy was done on 121 patients, 3 having a two stage operation. Thyrotoxic reactions were less before, during and immediately after the operation than shown by comparable patients treated with iodide but there was greater vascularity and friability of the thiouracilized glands. The combined administration of iodide and thiouracil gave the best results. Ninety-five of these patients have been examined one or more times during intervals of from three to eighteen months, 85 exhibited no evidence of thyrotoxicosis and no complications from the thyroidectomy, 5 exhibited a persistence of thyrotoxicosis and 2 had a recurrence. Two

patients developed a paralysis of one vocal cord, 2 were found to have tetany and 1 became myxedematous The treatment of 100 patients, most of whom were given thiouracil for many months, was discontinued Forty nine of these patients have gone without treatment for intervals of from three to twenty-one months, and none have experienced a relapse Fifty one patients exhibited a relapse of the disease within two weeks to five months On cessation of therapy sustained remissions of the thyrotoxicosis were more apt to occur the longer the thiouracil had been given, when there was only slight enlargement of the thyroid gland in subjects with slight increase in the basal metabolic rate and when the patients were females About two thirds of 69 patients who were treated for eight months or longer exhibited a decrease in the size of the thyroid gland, a few glands increased in size

**Toxic Reactions of Thiouracil**—Williams and his associates report the toxic reactions encountered in 247 patients who were treated with thiouracil Thirty-six, or 14 5 per cent, had such reactions In 13 patients the leukocyte count decreased to 3 800 or below, and 3 others developed agranulocytosis There were febrile reactions in 7, maculopapular eruptions in 6, edema of the legs in 6, urticaria in 5, neuritis in 5, arthritis in 2 and enlargement of the submaxillary salivary glands in 1 There was a rare complaint of headache, nausea, vomiting and diarrhea. In 18 patients 7.2 per cent, it was necessary to discontinue thiouracil therapy because of reactions to this drug In 2 additional instances, each with urticaria cessation of treatment was regarded as advisable although perhaps not compulsory All the patients in this series recovered from the toxic reactions Each of the 3 patients with agranulocytosis not only recovered from this reaction but have gone for intervals of from eight to twenty months free from thyrotoxicosis in spite of no treatment The routine administration of special capsules of liver powder containing more folic acid than usual did not afford protection against the development of toxic reactions Unnecessarily large doses of thiouracil and long interrupted intervals of treatment tend to increase the frequency and severity of toxic reactions

**Methyl Testosterone and Surgical Castration in Carcinoma of Breast**—Boger employed surgical castration and concomitant administration of methyl testosterone in the treatment of a woman aged 27 with extensive carcinoma of the breast She was given 1,440 mg of methyl testosterone over a period of eight months after the surgical castration The patient was bedridden when the therapy was instituted, and within two weeks thereafter she was ambulatory and free from pain. Extensive osteolytic metastases in the spine and pelvis were partially recalcified within six weeks The patient died approximately one year after treatment was begun, but she was given eight months of useful living before her condition began to deteriorate

Classification of Anxiety Reactions (Anxiety States) J M Schneck—p 81

**The Vegetative Nervous System and Angina Pectoris (Abdominalis)**—Hess reviewed the anatomic findings outside the chest of patients who died following attacks of angina or coronary occlusions In the first group of patients, in whom the syndrome of angina abdominalis was recognized during clinical observation, necropsies revealed anatomic changes in the coronary arteries, secondary involvement of the myocardium (recent or old myomalacia) or myocardial aneurysm in some cases syphilitic aortitis in addition to the coronary disease and finally, ulcers in the esophagus, stomach or duodenum The author thinks that in a second group of patients, in whom coronary disease and gastrointestinal hemorrhages coincided, the syndrome under discussion was in its early stages In a third group coronary disease was found to be associated with old ulcers The author considers four possibilities in explanation of the anatomic findings 1 The coincidence of the cardiovascular signs and of ulcers is incidental 2 The ulcers are dependent on the condition of the coronary arteries 3 The ulcers are dependent on a generalized disease of arteries (sclerosis syphilis), as are changes of coronary arteries 4 The coronary disease (bouts of angina pectoris thrombosis of the coronary artery) and the ulcers are dependent on one common cause Involvement of the vagus plays a certain part, and the primary site of the anginal attack may be located in the center of the vegetative nerves

**Reinnervation of Paretic Muscles**—Billig and his associates studied the effect of axon branching on the power of muscles of patients with residual paresis resulting from polio myelitis The procedures applied were calculated to cause axon branching of the motor fibers which have escaped destruction in order to innervate with the extra branches muscle fibers which lost their nerve supply Since fiber redistribution was to be eliminated as much as possible, the motor nerve was interrupted as close to the individual muscles as feasible Two methods were used the crushing of the motor nerve after its surgical exposure (surgical method) and the severing of the intramuscular nerve structures by a forceful massage of the muscle (manual method) A total of 923 leg muscles and of 251 arm muscles were treated with the surgical method, 1 429 leg muscles and 702 arm muscles were treated manually The result of the surgical treatment was a definite improvement of the muscles with a low initial rating The muscles with a high initial rating showed a mean loss of muscle power The

application of the surgical method should remain restricted to the muscles of an initial rating lower than "poor" The manual treatment produced a similar mean improvement of the muscle power, but it was not restricted to the muscles of low initial rating The manual treatment thus can be applied to all paretic muscles It was found in the surgical series that the improvements in the arm muscles were greater than those in the muscles of the leg In the manual series the benefit was the greatest in the leg Nontreated control muscles showed only the slightest changes in muscle power during the period of observation No distinct influence of the duration of the paretic state (which was always longer than one year) was observed, nor was a significant influence of the patient's age noted The effect of the manual treatment has reached its maximum after about one year There is evidence that the surgically treated muscles still improve after that period A repetition of the manual treatment after a preceding surgical or manual treatment increased the mean muscle rating only slightly, if at all Paralleling the increase in muscle power, an increase in the size of the action potentials was observed

**Effects of Drugs on Asthma Produced by Histamine** —Loew and his associates have published data indicating that benhydryl alkamine ethers and other antihistamine agents are effective in reducing the severity of bronchoconstriction following exposure of guinea pigs to atomized histamine solutions It is important to determine whether the drugs found to be effective are limited to those employed clinically by virtue of their recognized efficacy in bronchial asthma and to those which possess a demonstrable antihistamine or antispasmodic action A comparison was made of the effectiveness of bronchodilator drugs, uterine and gastrointestinal antispasmodics, and other types of drugs in experimental asthma induced with atomized histamine The authors found that trasentin, pavatrine and syntropan failed to alleviate experimental asthma induced by histamine Effective antispasmodic drugs in order of decreasing potency were epinephrine, benadryl, isonipecaine, atropine, papaverine and aminophylline Bronchoconstriction referable to inhalation of histamine was not diminished by ergotamine tartrate, the local anesthetics procaine and nupercaine, or by respiratory depressants such as morphine and pentobarbital Physostigmine and ephedrine increased the severity of the experimental asthma The failure of procaine and nupercaine to decrease histamine shock is of experimental interest because procaine is frequently used as a local anesthetic when intravenous injections are made in experiments dealing with histamine and anaphylactic shock

**Hypoglycemia in Undernourished Persons**—Gounelle and Marche observed spontaneous hypoglycemia among persons subjected to prolonged undernourishment in France during the years 1941 and 1942 Of interest is the occurrence of spontaneous hypoglycemia in persons whose diets were deficient in proteins and fats and not in carbohydrates Apparently deficiency of protein and fat causes hypoglycemia, just as it causes edema In most of the cases there is a characteristic clinical picture associated with complete coma disturbances of respiration, muscle spasms and a bilateral Babinski sign Special note is made of the frequent absence of convulsions and perspiration, the opposite of what is generally observed in coma caused by hypoglycemia with hyperinsulinism Examination of the blood reveals a fall in blood sugar generally to below 0 4 Gm in a liter There is a moderate excess of nitrogen in the blood (around 1 Gm), the two disturbances seem to be associated. Diagnosis of these attacks is often confused with meningeal hemorrhage. Therapy should be instituted immediately in the form of intravenous injection of hypertonic dextrose solution (minimum 40 cc. of a 30 per cent solution) When successful, a return to consciousness is noted as soon as the injection is finished Some irreversible cases exist in which all therapy fails After consciousness is regained, sugar syrup should be given by mouth and dextrose solution hypodermically A diet rich in fats and protein should be given for a long period because the blood sugar often remains low for weeks and recurrence of the disease is frequent Anatomic study of nutritional spontaneous hypoglycemia revealed atrophy of the glandular part of the hypophysis and lesions of the diencephalon There are apparently two factors associated in producing this syndrome an unbalanced diet, particularly a deficiency of fat and protein, and an endocrine deficiency acting on the system causing hyperglycemia (hypophysis, adrenals, thyroid) secondary to the nutritional deficiency

**Penicillin Lozenges in Oral Infections**—One hundred and seventeen patients of the armed forces with acute infection of the nasopharynx and tonsils were treated with penicillin lozenges of 500 units strength each The lozenge was made of acacia and penicillin in the required dosage and included powdered sugar and peppermint as flavoring agents The patients were warned not to chew or suck the lozenge but to permit it to dissolve Of these 117 patients cures were produced rapidly in 110 (94.2 per cent) Hospital days were fewer for patients treated with penicillin than for those receiving nonspecific treatment. Eighty-seven patients were successfully treated on an outpatient status, thereby saving many hospital beds and man hours for effective duty Vincent's infections of the mouth are successfully treated with penicillin lozenges Penicillin locally appears to have no effect on deep tonsillar infections

*Analysis of Influence of Alcohol on Experimental Neuroses in Cats J H Masserman—p 36

**Influence of Alcohol on Experimental Neuroses in Cats**—Twenty-one cats were taught first to obtain food by opening a box, then to respond to various conditional signals and finally to solve difficult problems involving the passage of barriers and the manipulation of switches to secure their reward Masserman and Yum observed that alcoholic intoxication in the cats disintegrated the adaptive patterns to a varying degree, particularly those that were most complex and most recently learned Normal animals however, showed complete restitution of function on recovery from intoxication, little habituation to alcohol, and no signs of developing a preference for the drug The animals were subjected to special experimental procedures that induced and reinforced motivational conflicts between hunger and fear Under such circumstances they developed "experimental neuroses," characterized by pervasive inhibitions of normal goal responses, hypersensitivities and aversions to stimuli associated with the conflictful field, loss of group dominance and persistent aberrations of somatic and motor function The administration of small doses of alcohol again disintegrated these relatively complex "neurotic patterns and permitted relatively simple goal oriented responses to supervene. A significant number of cats repeatedly experiencing such relief from neurotic tensions developed a preference for alcoholic drinks, i e showed evidences of addiction to alcohol However, as their re-exploratory behavior while mildly intoxicated partially resolved conflicts, this addiction diminished until nearly normal food choices were restored

**Perforation of Esophagus Caused by Flexible Gastroscope**—Paul and Antes previously reported a case of perforation of the esophagus by the flexible gastroscope at the University of Iowa Hospital. In that case death resulted within twenty-four hours. They report a similar perforation which resulted in retropharyngeal abscess formation. Considerable manipulation was necessary in order to pass the instrument into the esophagus. This was undoubtedly a factor in the causation of the retropharyngeal perforation. Prompt recognition and treatment of this complication saved the life of the patient. The 2 cases of perforation occurred in more than 1,850 gastroscopies. This complication has fortunately become rare since the introduction of the flexible gastroscope.

**Blood Amylase Activity in Pancreatitis**—Polowe's study is based on 78 blood amylase activity determinations on 69 patients. Moderate to intense blood amylase activity is almost always associated with disease of the pancreas. Normal or decreased blood amylase activity almost always excludes pancreatitis. Where pancreatitis exists in conjunction with a normal or decreased blood amylase activity it may be safely assumed, if the patient's clinical status bears it out, that the pancreatitis has subsided or is subsiding. A slightly increased activity of the blood amylase may be regarded as indicating pancreatic involvement secondary to pathologic change elsewhere. When in doubt, tests should be repeated every day or every other day. The presence of multiple pathologic changes is the rule rather than the exception in acute pancreatitis. Biliary tract disease is the commonest complicating factor. An attack of acute pancreatitis may be the first clinical sign of the presence of biliary tract disease. In acute pancreatitis a history of repeated attacks of epigastric pain, sometimes dating back several years, may be obtained in almost every case. Decreased or absent blood amylase activity in this series of 69 cases was in no instance associated with acute pancreatitis. The liver is one of the main sources of blood amylase, and decreased or absent blood amylase activity may be interpreted as evidence of impaired liver function. When so interpreted the test should be corroborated by other liver function tests.

**Parenteral and Oral Administration of Amino Acids**—Madden and his associates point out that nitrogen balance has been obtained in human beings with threonine, valine, leucine isoleucine, lysine tryptophan, phenylalanine and methionine. The mixtures used by the authors contained in addition to the aforementioned eight amino acids, histidine, arginine and aminoacetic acid. For parenteral administration the amino acids were dissolved in distilled water just below the boiling point filtered and autoclaved and were given intravenously or subcutaneously in 6 to 13 per cent concentrations. In the first patient, who had chronic ulcerative colitis, nitrogen balance and considerable weight gain were obtained during eighty-five days when amino acids furnished the bulk of the nitrogen intake (85 to 93 per cent). Synthetic mixtures of the ten amino acids essential for the growth of rats and aminoacetic acid provided this nitrogen, except for the period when the protein hydrolysate amigen was given. Neither the amino acid mixture nor the protein hydrolysate amigen was quite as well utilized parenterally as orally and neither was quite as well utilized orally as the better natural food proteins. Omission of histidine from a mixture of amino acids resulted in a negative nitrogen balance. During the oral feeding periods nitrogen retention was considerably greater than during the injection periods. The clinical condition of the patient improved. Observations on 2 other patients proved the value of amino acid mixtures in the preoperative and postoperative nutrition. The case of a child with an unhealed burn of one year's duration demonstrated that a high protein intake may shorten illness and save lives and that the best source of a high protein intake is a diet of natural foods—useful and spectacular though parenteral feeding may be. A high protein intake by this protein depleted patient brought about complete healing after all other treatment had failed. The authors stress that proper mixtures of amino acids are capable of providing the protein nitrogen requirements of man and animals over long periods. Indications for the use of amino acids exist only when natural protein cannot be effectively used.

**Accidental Transplantation of Cancer in Operating Room**—Brandes and his associates discuss a case in which, several months after a radical mastectomy for a highly malignant scirrhous carcinoma of the breast of a woman aged 47, cancer nodules were found in the skin of the donor site on the opposite thigh. The usual precautions had been taken after biopsy of the tumor and before the mastectomy, viz., changing of operators' and nurses' gloves and redraping and reprepara tion of the patient. However, after the mastectomy, when a defect in the skin over the operative site was to be covered, a skin graft was taken from the left anterior thigh without first changing the contaminated gloves used at operation. Washing the gloves in sterile distilled water was apparently insufficient and tumor cells were transferred from the operative site to the raw donor area, where they survived and gave rise to tumor nodules.

**Paravertebral Block and Angina Pectoris.**—Braun studied the electrocardiogram in 12 patients who had frequent attacks of angina pectoris before and shortly after paravertebral sympathetic block. Of 11 cases with cardiographic abnormalities before the block, 8 showed an improvement of the cardiogram. The T waves which before the block were flat, diphasic, isoelectric or negative, showed a tendency to return to normal. The improvement of the cardiogram did not always coincide with the relief of pain.

**Effect of Daily Vitamin Supplement on Children.**—A total of 1,620 children aged 5 to 14 years attending elementary and secondary schools in Stoke-on-Trent and Salford were divided into two groups, one of which received on each school day for a year (1943-1944) a vitamin capsule containing vitamin A 4,000 international units, vitamin $B_1$ 1 mg., riboflavin 2 mg., nicotinamide 20 mg., ascorbic acid 30 mg. and vitamin D 400 international units. The other group received a placebo free of vitamins. The vitamin supplement had no consistent effect on growth, strength, endurance, fatigue, potential incidence or severity of clinical conditions, hearing and absenteeism from school. In the analysis of the data the children were grouped according to social, economic and nutritional status, but no effects of the vitamin supplement could be discerned on the aforementioned criteria. The vitamin supplement had a beneficial effect on gingivitis in Stoke but not in Salford. Evidence from a further series of trials indicated that ascorbic acid alone has no beneficial effect on that condition. Dietary studies made in conjunction with the test showed that the average ascorbic acid intake in the diets was well below the intake recommended by the National Research Council (United States) and that many children probably had intakes of less than 10 mg. daily over long periods. The absence of effect of the vitamin supplement and the generally good nutritional state of the children threw doubt on the validity of the National Research Council standards.

Hemoglobin Levels in Blood Donors. Alice J. Marshall.—p. 1
*Ehlers-Danlos Syndrome: Description of 3 Cases. A. Brown.—p. 7
Two Cases of Neonatal Tuberculosis. J. Buchanan.—p. 12

**The Ehlers-Danlos Syndrome.**—Brown says that the Ehlers-Danlos syndrome is characterized by hyperelasticity of the skin, hyperextensibility of joints and a hemorrhagic tendency. Two of the patients mentioned by the author, a mother and daughter, showed hyperextensibility of joints and a hemorrhagic tendency. In four generations of their family 19 of 47 individuals were affected by a similar or closely related defect. Among affected members of this family hyperelasticity was minimal in the earlier and a dominant feature in later generations. An unusual friability of the skin showed an inverse relationship. A third case is described in which increased friability of skin and subcutaneous tissues was associated with almost entire loss of body hair, slight hyperelasticity of skin and a hemorrhagic tendency. These features developed at the age of 53 and there was no evidence of a hereditary element.

*Nutritive Values of Wheat Flours of Different Extraction Rates. Harriette Chick, A. M. Copping and E. B. Slack.—p. 196

**Nutritive Values of Wheat Flours.**—Chick and her associates show that the content of different B vitamins in wheat flours milled to contain 100 per cent (whole wheat) 85 per cent, 80 per cent and 70 per cent (white flour) of the grain, progressively decreases as the degree of extraction is lowered. The B vitamins tested included vitamin $B_1$ (thiamine), riboflavin, vitamin $B_6$ (pyridoxine), nicotinic acid, pantothenic acid and biotin. In many tests the content of thiamine and riboflavin in flours of 85 per cent extraction was of the same order as that in whole wheat flour; the content in flours of 80 per cent extraction was usually much less. In growth experiments with young rats a lowering of the growth promoting value of the proteins in the flours was demonstrated when the degree of extraction of the wheat fell from 100 per cent to 70 per cent in spite of the fact that the digestibility of the nitrogen of the latter was greater than that of the former. The productivity of the food and nitrogen consumed when the diet contained flours of 85 per cent extraction was not inferior to that observed with whole wheat (100 per cent) flour; the proportion of the nitrogen consumed which was retained in the rats' bodies was however slightly less (24 per cent compared with 26.8 per cent).

**Sternal Puncture in Posthemorrhagic Anemias** —Croizat and his associates studied the sternal punctate of 31 patients with posthemorrhagic anemia following severe hemorrhage from various causes Medullary hyperplasia observed in all cases was characterized by an increase in the ratio of the erythroblasts, often more than 40 per cent but rarely exceeding 50 per cent All other medullary changes, particularly decreases of neutrophil granulocytes, were relative or secondary to the erythroblastosis. The cause of the hemorrhage did not have a determining effect on the punctate The character of the hemorrhage had some influence The erythroblastosis which resulted from repeated small hemorrhages seemed to be more important than that from severe acute hemorrhages, in the latter cases the hemohistioblasts and the plasmocytes tended to increase The degree of anemia had little effect on the global ratio of the erythroblasts, but the most immature of these cells were more abundant as the anemia was more pronounced In all the hypochromic anemias, particularly the posthemorrhagic type, disturbances of the maturation at the erythroblasts may occur and are especially pronounced at the orthochromatic stage Erythroblastosis starts within the first two days after the hemorrhage and ceases at the time the ratio of the red blood corpuscles is restored to normal

**Bacterial Allergy in Cutaneous Infections Due to Staphylococci** —Bjæ produced hypersensitiveness of the skin against staphylococcic infection by injecting rabbits with 0 5 cc. of a staphylococcus vaccine intracutaneously The hypersensitiveness reached a maximum after five to seven weeks and then declined in spite of continued injections The titer of the hypersensitiveness was determined by the allergic cutaneous reaction produced by the intracutaneous injection of 0 05 cc. of a staphylococcus filtrate in increasing dilutions Intracutaneous injections of a mixture of decreasing amounts of the filtrate with a constant amount of antitoxic serum did not influence the reaction which developed after the injections of staphylococcus vaccine Intracutaneous injections with various other bacteria such as hemolytic streptococcus, pneumococcus and Salmonella proved that the cutaneous reaction was specific. Neither by intracutaneous nor by intravenous injections of the serum of sensitized rabbits could the hypersensitiveness be passively transmitted to normal rabbits In the sensitized rabbits a minimum dose of the bacteria caused considerable local reaction (abscesses) after intracutaneous or subcutaneous injections of either living or formaldehyde killed cultures. The yellow staphylococcus produced more pronounced reactions in the allergic rabbits than the white "avirulent" staphylococcus, but the latter also produced severe lesions in sensitized animals. White staphylococci produced lesions in rabbits sensitized to yellow staphylococci and vice versa Attempts to produce furunculosis in the allergic rabbits failed when virulent staphylococci were rubbed into the skin of the animals or when bandages soaked in such cultures were applied to the skin Intracutaneous or subcutaneous injections of vaccine failed to desensitize the allergic rabbits After intravenous injections of 5 cc of the staphylococcus filtrate which contained possibly a factor of hapten nature the rabbits became completely desensitized in a short time The same effect was produced with the intravenous injection of 10 cc of a concentrated filtrate A preliminary therapeutic trial by intravenous injections of the filtrate was made in 3 cases in which there were chronic staphylococcic infections of the skin In the first case, in which there was severe sycosis of the beard, the treatment was ineffective. In a second case, of furunculosis of the lower extremities, improvement occurred but the disease recurred after treatment was discontinued In a third case, of severe facial acne, there was definite improvement In the course of the treatment reactions were observed in all 3 cases which may have been due to impurities in the filtrate

# Book Notices

**Clinical Roentgenology of the Heart** By John B Schwedel, M D Lt Commander M C (V)S U S N R Annals of Roentgenology Volume XVIII Cloth Price $12 Pp 380, with 749 illustrations. New York Paul B Hoeber Inc 1946

Progress in the early detection and understanding of heart disease has been continuous during the past fifty years Fluoroscopy has not been generally used by cardiologists but some physicians have studied it and contributed significant observations to our knowledge of the beating heart and its great vessels Unlike physical examination and electrocardiography, fluoroscopy has not been given its proper recognition as an essential part of a complete examination of the heart After extensive experience in cardiac fluoroscopy Dr Schwedel has written a comprehensive yet easily understandable book on the subject. Early chapters deal with methods of examination of the patient, cardiac measurements, normal cardiac contours and variations that accompany age, body build, sex, posture, respiration, phases of the cardiac cycle and other minor features *Suggestions that will be of help to the beginner and* of interest to the cardiologist are found among the many sound recommendations in the first chapters Various chambers of the heart are discussed, beginning with the left ventricle and ending with the right auricle

Many well chosen and remarkably clear illustrations are interspersed throughout the text All the illustrations are reproductions of the fluoroscopic image, and the author has done well in avoiding the usual roentgenograms—a practice unfortunately followed by others The book is printed on a good grade of glossy paper, so that the clarity of the fluoroscopic findings is retained Many line drawings to the right of the fluoroscopic pictures point out the salient features of the condition under discussion The author has used remarkable restraint in holding the retouching of fluoroscopic plates to a minimum Retouching is done only when important features would have been missed or when they appeared so vague that they might have been misinterpreted Unfortunately there are too few anatomic photographs showing the relation of the heart and great vessels to other structures With the wealth of clinical and pathologic material available to the author, greater use of photographs of actual pathologic specimens would have added much to the book

General cardiac enlargement is summarized in a short chapter The work of Dr Tinsley Harrison and others should have been briefly mentioned In the discussion of cardiac measurements there are a number of recognized tables However, the tables of Hodges, Adams and Gordon for the prediction of normal cardiac area and transverse diameter, using the frontal cardiac silhouette, for children are not included The discussion of the aorta and diseases of the aorta is well written, thoroughly illustrated and one of the best features of the book. A chapter on the great veins and brachiocephalic vessels is too short to be helpful to those learning fluoroscopy of the cardiovascular system Changes in the lungs often associated with or following heart disease are adequately discussed Several excellent photomicrographs of lung tissue show the pathologic condition under discussion An abundance of well chosen illustrations, proper balance among the several lung conditions and lucid explanations combine to make this chapter one that will help many in the mastery of chest fluoroscopy Discussions of congenital heart disease and cardiac displacement following changes in the thorax are also thoughtful expositions of less important features of cardiovascular conditions The section on pericarditis is a little too short. Roentgen kymograms and more electrocardiograms would have added to an understanding of adhesive pericarditis In spite of these criticisms the volume is a sound, practical guide to physicians interested in cardiology It will be of assistance to those who wish to learn the technic of cardiac fluoroscopy and will be a guide to the cardiologist in his understanding of some of the phenomena of the beating heart Books of this kind will make the medical profession realize that no examination of the heart is complete without *fluoroscopy*

**A Psychiatric Primer for the Veteran's Family and Friends** By Alexander G Dumas M D and Grace Keen Cloth Price $2 Pp 214 with illustrations Minneapolis University of Minnesota Press 1945

This book is exactly what its title describes it to be. It was written in collaboration by a psychiatrist who has had long experience with veterans and a skilful popular writer The content is sound and substantial It is centered about the problems of the uninjured veteran, the physically injured man who requires more treatment, the physically injured man who requires only job rehabilitation, and the mentally wounded Many short case illustrations are used which are sensibly condensed and make their points well It is a book which relatives of patients in veterans' hospitals and veterans undergoing treatment by physicians under the new Veterans Administration plan will find exceedingly useful The reviewer faces at the present moment the problem of giving some type of similar information to three hundred Gray Ladies and others who wish to do voluntary work in a veterans' hospital, such a book as this will certainly prove most helpful

On the critical side, it might be said that the selection of reading might have been better, for example, David H Fink's 'Release from Nervous Tension," announced as likely to "help the reader find and inherit himself," would not receive the endorsement of most psychiatrists Also the original scheme of the book is the presentation of five women waiting on the station platform of a midwestern town for the arrival of the train bringing home their menfolk from the war This excellent idea is mentioned in the first chapter and again at the first of each succeeding chapter, but unfortunately it is never carried through, which gives the reader something of a feeling of having been cheated or at least deprived of an interesting opportunity to learn of the interpersonal relationships of veterans and veterans' wives more specifically

**La protection alimentaire des Ecoliers** Par le Dr Jean Sutter Fondation française pour l'étude des problèmes humains Équipe nutrition Paper Price 150 francs Pp 181 with 16 illustrations Paris Librairie de Médicin 1945

It will surprise no one to find the French working rather desperately on the 'food problem" as it affects children of school age. This paper bound brochure (and the paper is of the poorest quality) does not attempt to 'solve" the matter of production and distribution It does, however, cast about for a look at the way other countries, notably England and the United States, are working at the daily food needs of children in their care. The statistics are by no means flattering in spite of *our notion that* we in America are "the best fed nation in the world" for there in black and white are figures from surveys made in the Bronx and in Manhattan, among other places, to prove that some of our children, at least, go to school hungry This is, to be sure, disgraceful and is not to be tolerated In fact, the boards of education in the various cities are much concerned over it, and yet it seems that no city has as yet solved quite completely the matter of distribution There is still a wanton waste of edibles on farms and in the markets partly because of the time and distance elements, since most foods are perishable This may change for the better, now that the frozen food mart is at hand Strawberries frozen in June are eaten in January and seemingly are right out of the garden The cost is still a deterrent factor and will remain so for a long time to come This is a problem the League of Nations took up, but its solution if any, is not yet at hand Perhaps the UNO may be able to work it out.

**The Physiological Basis of Medical Practice** By Charles Herbert Best C.B.E M.A M D Professor and head of Department of Physiology University of Toronto Toronto Canada and Norman Burke Taylor V.D M D F.R S Professor of Physiology University of Toronto \ University of Toronto Text in Applied Physiology Fourth edition Cloth Price $10 Pp 1169 with 497 illustrations Baltimore Williams & Wilkins Company 1945

This volume has had thirteen reprintings as well as an edition in Spanish and Portuguese. In the new edition the book is set in a two column format which saves space and makes easier reading In the reproduction the size of the illustrations has been reduced and new illustrations have been added. The new material, which represents advancement in medical knowledge, compensates for the deletions The book is one of the most complete and dependable works available in the field of applied physiology

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES THEY DO NOT, HOWEVER REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS BUT THESE WILL BE OMITTED ON REQUEST

## POSTOPERATIVE ORAL FEEDING

*To the Editor*.—There is a difference of opinion at our hospital as to the time for routine feeding of postoperative patients Our staff agrees on the maintenance of the daily requirements of chlorides carbohydrates and protein administered parenterally in the form of transfusion plasma amigen glucose saline solution and distilled water However, opinion differs as to the optimum time for giving fluids and diet by mouth Some physicians routinely order nothing by mouth for the first twenty-four hours while others attempt to give a sufficient diet as soon as tolerated What is the consensus on this point?

M D, New Hampshire

[This inquiry was referred to a surgeon and an internist, whose respective replies follow ]

ANSWER.—Immediately after operation it is undesirable to allow anything to be given by mouth, particularly if the patient has had an abdominal operation or a general anesthetic, because trauma to the abdomen results in a functional physiologic ileus The length of time that such ileus exists is dependent on a number of factors Since the ileus is the result of stimulation of the splanchnics, the greater the operative trauma or the longer the persistence of trauma as in peritonitis, the longer the ileus lasts In cases in which there has been relatively slight trauma, such as an interval appendectomy, physiologic ileus lasts six to eight hours, and following this period sips of tap water or hot broth can be allowed In cases in which the trauma is more extensive, ileus lasts longer and food should be withheld until the ileus has subsided In such an instance it is frequently desirable to introduce a duodenal catheter to prevent vomiting In the absence of extensive trauma, or absence of infection, the ileus usually will have subsided within twenty-four hours After subsidence of ileus, the best stimulant to peristalsis is the administration of food One can determine the ability of the gastrointestinal tract to retain food by first giving small amounts of hot tea, fat-free broth or tap water Following this, cooked cereal can be given It is important to withhold milk, fruit juices and carbonated drinks in the early postoperative period because of the distention which these substances cause A well broiled steak is usually tolerated well shortly after the subsidence of the ileus Dry toast and jello are also tolerated early A full diet, with the exception of milk, fruit juices and carbonated drinks, is allowed soon after the administration of the more readily assimilated foods mentioned

ANSWER.—The resumption of oral feeding depends entirely on the nature of the disease, the operation and the postoperative reaction of the patient It is an individual problem Influencing factors include fever, appetite, nausea, vomiting, distention and diarrhea

At present there is a tendency to early ambulation and prompt return to a normal diet If there is no vomiting after herniotomy, cholecystectomy or appendectomy, water is given by mouth after the operation, followed by other fluids the next day If these are tolerated, a soft and finally a regular diet is allowed After gastrectomy or colectomy, parenteral fluids or only water by mouth are continued for several days before solid foods are given, depending on the factors noted

## TREATMENT OF PINWORM INFESTATION IN INFANTS

*To the Editor*.—In treating pinworm infestation what is the dose and the method of administration for gentian violet and for hexylresorcinol for a 2½ year old child who will not swallow pills tablets or capsules? What is the present status of compound santonin tablets as a pinworm treatment and what would be the proper dosage for a 2½ year old child?

M D Massachusetts

ANSWER.—The accepted treatment of infants for pinworms leaves much to be desired Infants under the age of 2 will not take tablets, and those under 3 also may object. It is advisable with small children to give the tablet with a spoonful of jam The treatment agent of choice, gentian violet, cannot be administered except in coated tablets because of the disagreeable staining of the mouth and the saliva, gentian violet stains on clothing and linens cannot be removed Hexylresorcinol must also be given in coated tablets, because the drug will burn the mucous membranes of the mouth and, furthermore, it is not very effective against pinworms If gentian violet tablets cannot be administered, the best therapy is the use of nightly enemas given for the same twenty-three day interval during which the older members of the household are taking gentian violet The value of the enemas may be enhanced by the use of 1 2,000 hexylresorcinol, but isotonic solution of sodium chloride appears to be as effective

In a critical test, santonin was administered to 20 patients with oxyuriasis in one single daily dose for ten days Nine still harbored the parasites after this treatment, 3 were negative on seven post-treatment checks and 8 were negative on an adequate number of post-treatment checks The efficacy was 55 per cent on the most favorable interpretation of the results The usual adult dosage of santonin is 1 grain (0 065 Gm) daily, and Young's rule may be used to calculate the dosage for children, using the apparent age rather than the chronological age

## CARBONATION AND WATER PURIFICATION—QUALITIES OF ALCOHOLIC BEVERAGES

*To the Editor*.—Can you advise what effect, if any, the carbonation of water has in disinfecting it? The water used is obtained from wells located several kilometers from the nearest habitation and is untreated except for filtration and reduction of the high iron content I do not know the extent of carbonation but the product is similar to seltzer waters in the United States The question is whether such water can be considered safe for drinking purposes I should also like to know of some publication dealing with the manufacture of various alcoholic beverages and analyses of their content I e is it the nature of the basic alcohol, impurities or otherwise which determines the difference between one wine or whisky and another?

James M Bunce Captain M C A U S

ANSWER.—Carbon dioxide under pressure may lower the $p_H$ of a liquid sufficiently to inhibit a number of bacteria and may thus tend to reduce the danger of spread of disease agents The inhibitory activity due to carbonation is, however variable and uncertain and is dependent on the susceptibility of the different bacteria, the buffer capacity of the liquid, the degree of saturation with carbon dioxide, the temperature and the time The acidity of beverages carbonated under pressure varies, but the $p_H$ may be as low as 3 0, whereas that of water saturated with carbon dioxide is near 4 0 Carbonated beverages purchased on the open market have been reported to contain viable Escherichia coli and other organisms, at times in large numbers, and experiments in which Eberthella typhosa, Salmonella paratyphi B and Escherichia coli were experimentally inoculated into carbonated tap water and beverages have shown that these organisms may survive for some days in carbonated liquids Survival of the bacteria was, however, reduced in comparison with that in plain liquids In milk, carbonation under pressure was found to delay but not to inhibit souring, and in ice cream carbonation failed to reduce the number of bacteria These facts do not justify reliance on carbonation for water purification, particularly since other methods, such as chlorination, are well known to be effective

Answers to the questions regarding the qualities of alcoholic beverages can probably best be found in Prescott, S C, and Dunn, C G Industrial Microbiology, New York, McGraw Hill Book Company, 1940

## FRIGIDITY AND THE CLITORIS

*To the Editor*.—In Queries and Minor Notes in The Journal Feb 23, 1946 there is a question on frigidity and the clitoris The opinion of Greenhill is quoted that the vagina and not the clitoris is the principal sexual organ of the adult woman It is further stated that frigid women derive sexual excitement and satisfaction from the clitoris From practical observation in many cases I beg to raise a dissenting voice to these opinions In the first place I have repeatedly seen many normal well balanced adult married women whose complaints of lack of sexual pleasure and orgasm in intercourse were remedied by showing them or their husbands the position of the clitoris The apparent frigidity was then cured by a change of intercourse position so that the clitoris was stimulated or by manual stimulation To maintain that such women possess an infantile and not an adult erotic zone seems fallacious To call them frigid is a flagrant distortion of fact In the second place it seems logical on a physiologic basis that the clitoris which is morphologically similar to the glans penis and possesses the neurogenic mechanism for orgasm by friction should be the chief source of orgasm rather than the musculomembranous passage of the vagina especially after the latter has been traumatized by repeated childbirth In the third place the estimate of 35 to 75 per cent of women not deriving pleasure from intercourse is undoubtedly true but it is probably the result of a common lack of understanding of the importance of stimulating the clitoris and not because of frigidity or anatomic infantilism

## THERAPEUTIC RESULTS IN RHEUMATOID ARTHRITIS

OTTO STEINBROCKER M D
New York

To correlate the experience in our clinic with that of others, a survey was made of the recent literature on the treatment of rheumatoid arthritis Study of over two hundred articles revealed the well known multiplicity of therapeutic measures said to produce satisfactory results in a high percentage of patients [1] Striking discrepancies were noted in various reports on the outcome of identical methods of treatment, such as chrysotherapy [2]

This uncertainty in our therapeutic information has been summarized by Gold [3] As late as 1941 he stated

> I know of few subjects in therapeutics which seem to be in a more unsettled and unsatisfactory state than the treatment of arthritis It does not seem possible to chart the progress in this field by other than a horizontal line, with repeated spikes representing new therapeutic ventures The rise of the spike represents the "passive faith" which is so common a reaction to new agents or procedures, and the fall of the peak represents "aggressive skepticism." In few therapeutic fields do we find such sharp contrasts of views concerning matters which should be matters of fact

The chief attention in this survey was directed to the results of gold treatment - The literature of chrysotherapy proved to be a fairly typical example of the rather bewildering state of investigative methods and data in this field By this time over 6,000 cases of rheumatoid arthritis treated with gold salts have accumulated in the reports Such extensive experience would be expected to provide a valuable pool of information for any observer to compare with his own results

In going over this material, however, it soon becomes obvious that certain common denominators, to be considered later, essential for any dependable comparison or correlation of therapeutic experience, are lacking in the bulk of the work published The discussion of the literature of rheumatoid arthritis which follows, and the deductions, constitute an analysis of present day therapeutic methods in this disease There also will be recommended standards of procedure likely to correct some of the current deficiencies These criteria should yield more accurate, uniform and reliable evaluation of therapy Some of the suggestions originate here, some have been adopted already by too few writers A presentation of all of them at this time may stimulate a widespread acceptance of these standards

From the Arthritis Clinic Bellevue Hospital Fourth Medical Division (N Y U) Dr Charles H Nammack director

### SOME CONSIDERATIONS IN THE EVALUATION OF TREATMENT IN CHRONIC RHEUMATOID ARTHRITIS

In any therapeutic study of chronic rheumatoid arthritis it must be borne in mind that it is a systemic disease of undetermined origin with variable involvement and symptomatology As long as the cause is unknown, treatment must remain empirical This condition does not present a fixed clinical picture, nor does it pursue a uniform course in its localization and in its severity even in the majority of cases The clinical pattern may assume one of several characteristic forms, or combinations of them—the torpid, fluctuant or fulminating

It is not rare to find some one suffering from moderately advanced rheumatoid arthritis of five or even ten years' duration which has persisted with little obvious change or disability, occasionally without even forcing the patient to seek medical attention, so mild are the symptoms and so slight the impairment of function at the joints The torpid clinical signs and pathologic changes progress so subtly as to be distinguishable only by comparison of findings after long intervals

It also is not unusual to see a patient with rheumatoid arthritis who within a year or less has developed all the stigmas of advanced disease Most commonly, in the rheumatoid patient, we are dealing with a chronic disease which runs a fairly fluctuant life cycle punctuated by intermittent spontaneous recessions, remissions and exacerbations, mild or severe, complete or incomplete The sedimentation rate too is subject to variations at times approximating the normal even while the disease is active

Then there are the combinations of those types A patient may suffer from a low grade, torpid process which suddenly becomes restive, presents florid signs of exacerbation and goes on to a fulminating, devastating course Often a fluctuating, moderate or severe rheumatoid arthritis seems to have reached a stationary state of activity and persists indefinitely and relentlessly, holding the patient in a sort of limbo, or it may gradually or suddenly improve or halt with only slight remaining signs of inflammation and disability Any of these types of activity may slowly recede and finally resolve with no evidence of residual inflammation or only the changes due to an irreversible pathologic process The results of any treatment will be influenced by the incidence of each of these clinical types with their varying refractoriness

The spontaneous onset of improvement or remission intervenes more frequently and sooner, the earlier the

disease The exact incidence of natural recovery in the life cycle of rheumatoid arthritis during its various stages, unfortunately, is not known That it does occur with different frequency in all stages and in proportion to its severity is generally conceded, so that a time factor must be recognized in judging the effect of any form of therapy

An important peculiarity of every type of rheumatoid arthritis, at least under present methods of management, is the spontaneous recurrence of symptoms in many patients who seem to have recovered according to all ascertainable evidence One of our youngest, most rugged and responsive patients suffered a flare-up after two and one half years of clinical inactivity of the disease

Obviously a proper evaluation of treatment must take into account these innate characteristics of the disease The usefulness of therapy must be determined in such a way that our conclusions are not based on factors which may be natural episodes in the evolution of the rheumatoid process, particularly the spontaneous recessions and remissions

Although our subject is chronic rheumatoid arthritis, it is relevant to mention that in our wards in a group of 366 patients diagnosed as having acute rheumatoid polyarthritis, on general medical treatment approximately 90 per cent were discharged as recovered within three months of admission In subacute rheumatoid disease the percentage drops but is still high It is generally accepted that spontaneous recovery is apt to happen much more frequently in early chronic rheumatoid arthritis than in advanced cases With general medical measures Pemberton [4] observed complete recovery in 78 per cent of his army patients with (early) rheumatoid disease in World War I Those who are inclined to institute chrysotherapy or any specific medication for patients whose disease is of three months' duration or less, or for patients with early rheumatoid arthritis, must weigh the results in the light of these facts

*Analysis of Thirty-Four Papers on Chrysotherapy* *

| No Lumping of Results | Classification of Treated Cases According to Stages of Disease | Specific Criteria of Response Stated | At Least One Year Follow Up Period | Data on Response of Relapses |
|---|---|---|---|---|
| 21 | 16 | 15 | 7 | 6 |

* Table by Dr Alfred Blazer

As a sample of the status of recent therapeutic contributions to our subject, there is included a tabulation of the latest development, the American and British literature on chrysotherapy [5] Some of the sources of discrepancy, in my opinion, their occurrence in these publications, and the recommendations for their correction will now be considered

### INCLUSION OF PATIENTS WITH UNQUESTIONABLE RHEUMATOID DISEASE

In a therapeutic study of an unestablished drug in rheumatoid arthritis, only those patients should be included whose diagnosis is positive Some excellent treatises on the subject are marred by the failure to omit cases with a variety of chronic arthritic disorders—gonorrheal, tuberculous, chronic infectious and ankylosing spondylitis—all forms of "chronic arthritis" The number of such nonrheumatoid patients is also not specified, so that their place in the total results cannot be determined

There are many articular disorders which may resemble rheumatoid arthritis Unless precautions are taken to exclude them, inaccurate results may be obtained Some of these conditions are the specific infectious arthritides, atypical rheumatic fever, traumatic arthritis, osteoarthritis with chance elevation of the sedimentation rate, and a host of rheumatoid-like arthropathies, arthralgias and myalgias Recent authors appear to be more careful in their diagnosis of rheumatoid arthritis and in the selection of cases for special therapy, such as gold salts

### CLASSIFICATION OF PATIENTS ACCORDING TO STAGE OF DISEASE

For clinical insight and a more reliable prognosis, rheumatoid arthritis should be classified according to the stage to which it has progressed, just as in tuberculosis or heart disease An excellent classification along these lines has been worked out by Taylor [6] and seems to be worthy of general acceptance

6 Taylor D A Table to Indicate the Degree of Involvement in Chronic Arthritis Canad M A J **36**: *608* 1937

A careful evaluation of any method of therapy certainly requires tabulation of patients according to such categories of the disease Accurate reporting should include definite information as to the proportion of early, moderately advanced and greatly advanced, active cases in the group

It is generally accepted that early rheumatoid disease shows more frequent spontaneous and therapeutic response Pathologic and physiologic disturbances in later phases of the condition may become so severe as to alter reactivity to therapeutic procedures It is possible, therefore that appreciable differences in the incidence of the stages of the disease in various published series account to some extent for the seeming discrepancies in the results Of thirty-four authors, sixteen segregated their cases according to severity, and not all of these stated the exact proportion of the various stages

## THE USE OF SPECIFIC CRITERIA FOR ASSESSING RESULTS

A survey of the reports on various "satisfactory" methods of treating rheumatoid arthritis and the conflicting outcome of identical measures employed by different workers must reveal to any discerning reader that the lack of uniform, objective and precise criteria of response is the greatest source of discrepancy in the literature

Many rheumatologists must be aware of the need for definite standards of assessing results of treatment A few have expressed their views on this subject Baylis and Hall [8] have devised a helpful "yardstick" to accomplish it The Therapeutic Score Card employed in our clinic has proved a useful means of accurate estimation of response to treatment [9]

The basic standards of judging response to treatment must be objective, free from the influence of the patient's impression and the enthusiasm of the observer Joint swelling is the pathognomonic sign of rheumatoid activity Yet it receives surprisingly little attention and is apparently accorded minor consideration by many authors in estimating the outcome of treatment

The criteria for estimating response to therapy in rheumatoid disease may be divided into three groups—objective clinical, laboratory aids and subjective clinical The most objective basis of judgment is joint swelling Joint motion and tenderness are hardly as impersonal, but they are more objective than other information to be mentioned The laboratory or technical aids of value are the sedimentation rate, the hemoglobin (or erythrocyte count) and possibly weight gain The clinical features greatly influenced by subjective favors are pain, well-being and functional capacity The last two symptoms are of doubtful significance They are so widely employed, however, that they cannot be dismissed altogether Their share in any evaluation should be kept to a minimum

Some generally accepted and precise formula for employing all these features of the disease for accurate estimation of response to treatment, such as the "yardstick" of Baylis and Hall or our Therapeutic Score Card, would lead to more reliable and helpful therapeutic investigation The difficulty in comparing various results is emphasized by the failure of nineteen of thirty-four authors to include definite criteria of response on which their reports are based, as shown in the table

## DIFFERENTIATING THERAPEUTIC EFFECTS ON RHEUMATOID ACTIVITY FROM INFLUENCE ON FUNCTIONAL CAPACITY

Naturally, in our therapeutic goals we must distinguish the reversible, active inflammatory signs of rheumatoid disease from the irreversible, fixed changes While special surgical procedures and other measures may improve or correct some of the damage done, it would be unfair to a therapeutic agent to discredit it for unresponsive features already irreparable and beyond the effects of medical therapy from the start

The most prevalent fallacy in gaging therapeutic results, however, seems to be a failure to differentiate effects on the rheumatoid process from influence on the patient When a drug is under study for treatment of such an inflammatory disease as rheumatoid arthritis, surely it must be judged by the objective evidence of subsiding activity or arrest of that disease reflected almost entirely by the response of such features as joint swelling above all, then motion, tenderness and pain The proof of the effectiveness of the remedy must remain its ability to suppress or abolish the objective signs of active disease

Beneficial influence on the patient as a whole, with enhanced well being and even increased function, does not necessarily imply similar effects on the activity of the disease Nevertheless, in some of the outstanding contributions to chrysotherapy evaluation of results is made largely on such a functional basis When the rheumatoid process is ameliorated or arrested, increased use of joints is bound to occur unless complications or irreversible changes interfere On the contrary, greater or complete functional capacity may be inspired without any effect on the rheumatoid activity This point is well illustrated by Weiss and English,[10] who state

> One has only to witness the countless thousands of people who visit shrines and faith healers Most of these people are suffering from some form of chronic arthritis Many magical shrines are famed for the piles of crutches that have been thrown away by cripples, who, for the moment, consider themselves cured but most of whom have to buy more crutches after they get home

The enthusiastic, revivalist atmosphere surrounding the inauguration of some much publicized new method of treatment also stirs into action powerful, if transient, suggestive forces Suggestion exercises its effects through various therapeutic procedures in different hands It has been said by pharmacologists that chronically ill patients often respond well to a new treatment —or a new doctor—sometimes for long periods [11]

Much temporary or lasting benefit has been observed from the whole treatment program usually employed This includes constitutional measures, physical therapy, orthopedic aids and the influence of the patient-physician relationship Specific or palliative remedies as a rule are administered as a supplement to some or all of the aforementioned regimen When a substance is under investigation for its special effects on rheumatoid arthritis, the careful investigator would be expected to exclude any other treatment or to demon-

disease The exact incidence of natural recovery in the life cycle of rheumatoid arthritis during its various stages, unfortunately, is not known That it does occur with different frequency in all stages and in proportion to its severity is generally conceded, so that a time factor must be recognized in judging the effect of any form of therapy

An important peculiarity of every type of rheumatoid arthritis, at least under present methods of manage ment, is the spontaneous recurrence of symptoms many patients who seem to have recovered accor to all ascertainable evidence One of our yo most rugged and responsive patients suffered a after two and one half years of clinical inactiv disease

Obviously a proper evaluation of treatme into account these innate characteristics The usefulness of therapy must be det a way that our conclusions are not which may be natural episodes in t rheumatoid process, particularly th sions and remissions

Although our subject is chro it is relevant to mention that of 366 patients diagnosed

## ELIMINATION OF LUMPING, OR WISHFUL STATISTICS

It is a common custom to lump all improvements, from arrested cases to slightly improved, in the conclusions with one figure for "improvement" produced by the remedy Some reports mention that "slightly improved" represents only a subjective estimate by the patient This figure usually is included in the "improvements" In this way "the inevitable 70 per cent," or higher, appear to respond to almost every agent.[12] When a drug is on trial in rheumatoid disease, gold salts for example, it is doubtful whether anything less than great improvement provides favorable testimony or dependable information to be embodied in the conclusion

It is not unusual to read an enthusiastic discussion on the treatment of a series of patients only to find that the number of arrested and/or greatly improved cases fail to support the author's partiality When he finally gives his conclusions and lumps the "slightly" and "moderately" helped patients with those experiencing greater benefit, an impressive figure for improvement is produced This misleading custom is so widespread that it is responsible for much of the cloud-

discrepar publica tion

r understanding of the true merits of therasures Its abandonment would promote more owledge and more incisive evaluation of a gent The American and British reports tment represent on the whole the most refore the most careful therapeutic studies disease Lumping was found, neverthe- reports, as shown in the table

HING THERAPEUTIC SPECIFICITY D PALLIATIVE ACTION

written about the special therapeutic remedies in rheumatoid arthritis ly little distinction made as to their merits Usually an effort is made alities to various substances based nce of "improvement" when they

in the therapy of rheumatoid position should be indicated for paration advocated Is it a specific Or is it a superior palliative, but still palliative?

The results usually are stated from left to right in columns "arrested," "greatly improved," "unimproved," "worse" The index of specificity must be recognized as the percentage of cases appearing to the left in the "arrested" column Unfortunately, in much of the discussion of many "specifics" that have been advocated in the past and recently the "arrested" column is almost blank When any remedy produces an impressive therapeutic shift to the left in the "results" columns, it is likely to command undebatable acceptance, as with penicillin, the sulfonamides and the arsenicals

The evaluation of a palliative agent is an even more formidable problem than that of a specific It would require that an ameliorative substance should be demonstrated to yield a definitely higher percentage of relief than that experienced by an untreated control group or provided by other palliative remedies The results would have to be controlled by the various safeguards and criteria already discussed An appreciably higher percentage of improvement, statistically adequate, would have to be found

The usually unmentioned distinction between specificity and palliation has befuddled much of the discussion of therapy in rheumatoid arthritis[2] The value of "specifics" has been established largely by implication There is no reason why the definite palliative action of a drug on rheumatoid disease should be considered derogatory Rheumatoid arthritis is such a serious condition that a superior palliative would constitute a valuable addition to our therapeutic resources at this time The evidence and the distinction, however, should be clearcut

Palliatives, nevertheless, should not be mistakenly regarded as specifics Although palliative therapy can be a great help in the patients' comfort and management, it does not solve the problem of arresting rheumatoid disease The role of any agent should be plain and emphatic so that therapeutic progress is not discouraged by a smug attitude Until a remedy has been discovered which arrests rheumatoid activity in an impressive proportion of cases within a reasonable period, the therapeutic problem of rheumatoid arthritis must be regarded as unsolved

12 Nathan J., quoted by Hench P S Bauer W Dawson M H Hall Francis Holbrook W F and Key J A The Problem of Rheumatism and Arthritis Review of American and English Literature for 1936 Ann. Int. Med. 12: 1005, 1939

### INCLUSION OF A FOLLOW-UP PERIOD OR A PERIOD OF POTENTIAL RELAPSE

The tendency of rheumatoid arthritis toward a high percentage of recurrence for long periods after apparently successful treatment by present methods makes all conclusions as to therapeutic results unreliable unless an adequate follow-up period has elapsed Three years would probably be the safest interval to set arbitrarily as the period of potential relapse Five years have been suggested as a reasonable standard and would certainly afford still more dependable information [13]

In the literature on rheumatoid arthritis follow-up studies are almost nonexistent This void has been recognized in chrysotherapy, yet in the publications on gold treatment we have found only seven reports which included a fair follow-up period with a statement of the number of relapses that appeared It is important to know the final figures of response after these recurrent cases are treated in order to derive a thorough assay of the therapeutic agent After all, if a drug produces so many merely temporary remissions that in due time the percentage of arrests to be expected does not appreciably exceed the number occurring naturally, its contribution to therapy is of doubtful value, especially when there are hazards of toxicity

The ultimate fate of greatly improved patients and the proportion of relapse among them provide information as essential as in the arrested cases The value of medication sometimes is attributed to its superior palliative action, as in the case of gold salts in so many reports The incidence of relapse among the greatly improved patients then becomes the chief clue to the usefulness of the remedy In only six papers is there a follow-up report on the relapses among greatly improved patients [2]

### CONTROL SERIES

It is remarkable that in a search of the literature there was not uncovered a true control series of rheumatoid patients followed for a long enough period to give dependable information as to the life cycle of the untreated disease The most informative study of this kind, by Short, included 300 patients treated by simple, conventional medical measures and followed for ten years Whether therapy influences the severity and duration of rheumatoid arthritis must remain a matter of clinical judgment until a satisfactory basis of comparison is provided by an untreated control series followed for a sufficient time

Where enough patients are available, if alternate subjects are given only placebo therapy while the others are treated with the agent under study, more useful therapeutic assay could be conducted If the experiment is carried out as a blindfold test with the observer unaware of which patients are receiving the active substance a more fruitful study can be carried out While this discussion was being prepared the paper of Fraser appeared Because it embodies some of the criteria already mentioned, particularly the blindfold test, it should prove a really enlightening contribution to the subject

Many of the remarks on therapeutic investigation in rheumatoid arthritis could be applied with slight variation to other chronic diseases Similar pitfalls and like standards are involved This discussion is concerned only with rheumatoid disease

13 Short C L. Gold Therapy in Rheumatoid Arthritis, Bull New England M Center 4: 31 1942

### SUMMARY

The greatest advance in rheumatoid arthritis has been its recognition and segregation as a separate entity from other articular disorders The time has arrived to apply more generally to the study of its treatment the rigid and exact criteria prevailing in other clinical and laboratory fields When uniform standards are followed universally, much inconclusive effort will be avoided and the results should prove more valuable in a shorter time A more consistent and better integrated pool of information would be provided Unwarranted exploitation of poorly controlled studies by commercial interests at least would become less frequent

It would advance research in this field if its official agencies sponsored a set of essential principles to guide therapeutic investigation in rheumatoid arthritis along the lines discussed here An organized study of chrysotherapy under such auspices, conducted by several cooperating clinics taking part in a "blindfold" test, would prove invaluable

To assure more informative and reliable therapeutic studies of agents advocated for rheumatoid arthritis, the following safeguards are recommended

1 Inclusion only of cases definitely presenting the features of chronic rheumatoid arthritis according to the official classification of the American Rheumatism Association

2 Segregation of patients in such studies according to the stages of rheumatoid severity, as in Taylor's classification, to break down each observer's results and to distinguish the response of each category

3 Use of specific criteria for evaluating and grading results, such as the "yardstick" of Baylis and Hall or our Therapeutic Score Card

4 Differentiating therapeutic effects on disease activity from influence on functional capacity

5 A standard terminology of results—arrested, greatly improved, slightly improved, unimproved and worse, with definite significance for each

6 Elimination of lumping in evaluating results of a therapeutic agent on trial

7 Distinguishing specificity and palliative action

8 A reasonable interval after treatment—the period of potential relapse—at least three years, to intervene—followed by confirmatory follow-up examination, before apparent "arrest" or "great improvement" is acceptable for final reports

9 Control series alternated with those receiving anti-rheumatoid medication

121 East Sixtieth Street

**Scientific Research Demands Absolute Integrity**—We usually regard as honest a person who does not knowingly tell or report as facts what he knows not to be so or who does not leave out in his speech or writing some essential which actually changes the meaning or significance of what he does tell or report It is in this sphere that men in science have or should have, greater experience, training and conditioning than the rest of mankind because the scientific method and scientific research demand absolute integrity, the absolute sticking to the facts as known or discovered This does not mean that the scientific investigator is by heredity more honest than other fellow citizens It merely means that science and dishonesty do not mix—they are incompatibles—Carlson A J Is There 'A Standard to Which the Wise and the Honest Can Repair?' *Science* **103** 377 (March 29) 1946

strate the superiority of supplementary therapy with that agent as compared with other patients similarly treated without the new preparation A significant increase in the number of arrested or greatly improved cases would have to be produced to prove some added therapeutic response

### USE OF A STANDARD NOMENCLATURE OF RESPONSE

One of the great causes of confusion in any attempt to correlate the reported outcome of treatment in rheumatoid arthritis is the mixed terminology used and rarely clarified by definition Without a precise description of the author's meaning it is difficult to interpret such groupings as "distinctly improved," "definitely improved," "much improved," "greatly improved," "moderately improved," "good improvement," "slightly but definitely improved," "fair improvement," "slightly improved" and other similar gradations In the majority of papers these categories are not explained

Even when the writers define their terms, a great complexity of degrees of improvement confronts the student of rheumatology The task of correlating much of this material is magnified by the conflicting importance attached by various workers to subjective and objective factors in arriving at their evaluation In some instances, therefore, when authors happen to employ the same expressions for degrees of improvement their implications are not identical

A uniform terminology of results with the same significance everywhere, an international nomenclature, is an obvious need Such a simple grouping as apparently arrested (complete objective and subjective recovery), greatly improved (over 50 per cent resolution of objective signs), slightly improved (25 to 50 per cent recovery), unimproved and worse seems to provide a clear and adequate grading of response to a therapeutic procedure in rheumatoid disease

### ELIMINATION OF LUMPING, OR WISHFUL STATISTICS

It is a common custom to lump all improvements, from arrested cases to slightly improved, in the conclusions with one figure for "improvement" produced by the remedy Some reports mention that "slightly improved" represents only a subjective estimate by the patient This figure usually is included in the "improvements" In this way "the inevitable 70 per cent," or higher, appear to respond to almost every agent [12] When a drug is on trial in rheumatoid disease, gold salts for example, it is doubtful whether anything less than great improvement provides favorable testimony or dependable information to be embodied in the conclusion

It is not unusual to read an enthusiastic discussion on the treatment of a series of patients only to find that the number of arrested and/or greatly improved cases fail to support the author's partiality When he finally gives his conclusions and lumps the "slightly" and 'moderately" helped patients with those experiencing greater benefit, an impressive figure for improvement is produced This misleading custom is so widespread that it is responsible for much of the clouding of our understanding of the true merits of therapeutic measures Its abandonment would promote more accurate knowledge and more incisive evaluation of a therapeutic agent The American and British reports on gold treatment represent on the whole the most recent and therefore the most careful therapeutic studies in rheumatoid disease Lumping was found, nevertheless, in 13 of 34 reports, as shown in the table

### DISTINGUISHING THERAPEUTIC SPECIFICITY AND PALLIATIVE ACTION

Much has been written about the special therapeutic virtues of various remedies in rheumatoid arthritis There is surprisingly little distinction made as to their specific or palliative merits Usually an effort is made to imply superior qualities to various substances based on the greater incidence of "improvement" when they are used

The time has come in the therapy of rheumatoid disease when a clearcut position should be indicated for any therapeutic preparation advocated Is it a specific curative agent? Or is it a superior palliative, but still only a palliative?

The results usually are stated from left to right in columns "arrested," "greatly improved," "unimproved," "worse" The index of specificity must be recognized as the percentage of cases appearing to the left in the "arrested" column Unfortunately, in much of the discussion of many "specifics" that have been advocated in the past and recently the "arrested" column is almost blank When any remedy produces an impressive therapeutic shift to the left in the "results" columns, it is likely to command undebatable acceptance, as with penicillin, the sulfonamides and the arsenicals

The evaluation of a palliative agent is an even more formidable problem than that of a specific It would require that an ameliorative substance should be demonstrated to yield a definitely higher percentage of relief than that experienced by an untreated control group or provided by other palliative remedies The results would have to be controlled by the various safeguards and criteria already discussed An appreciably higher percentage of improvement, statistically adequate, would have to be found

The usually unmentioned distinction between specificity and palliation has befuddled much of the discussion of therapy in rheumatoid arthritis [2] The value of "specifics" has been established largely by implication There is no reason why the definite palliative action of a drug on rheumatoid disease should be considered derogatory Rheumatoid arthritis is such a serious condition that a superior palliative would constitute a valuable addition to our therapeutic resources at this time The evidence and the distinction, however, should be clearcut

Palliatives, nevertheless, should not be mistakenly regarded as specifics Although palliative therapy can be a great help in the patients' comfort and management, it does not solve the problem of arresting rheumatoid disease The role of any agent should be plain and emphatic so that therapeutic progress is not discouraged by a smug attitude Until a remedy has been discovered which arrests rheumatoid activity in an impressive proportion of cases within a reasonable period, the therapeutic problem of rheumatoid arthritis must be regarded as unsolved

12. Nathan J quoted by Hench P S Bauer W Dawson M H Hall Francis Holbrook W F and Key J A The Problem of Rheumatism and Arthritis Review of American and English Literature for 1930 Ann. Int. Med. 12: 1005 1939

### INCLUSION OF A FOLLOW-UP PERIOD OR A PERIOD OF POTENTIAL RELAPSE

The tendency of rheumatoid arthritis toward a high percentage of recurrence for long periods after apparently successful treatment by present methods makes all conclusions as to therapeutic results unreliable unless an adequate follow-up period has elapsed Three years would probably be the safest interval to set arbitrarily as the period of potential relapse Five years have been suggested as a reasonable standard and would certainly afford still more dependable information [13]

In the literature on rheumatoid arthritis follow-up studies are almost nonexistent This void has been recognized in chrysotherapy, yet in the publications on gold treatment we have found only seven reports which included a fair follow-up period with a statement of the number of relapses that appeared It is important to know the final figures of response after these recurrent cases are treated in order to derive a thorough assay of the therapeutic agent After all, if a drug produces so many merely temporary remissions that in due time the percentage of arrests to be expected does not appreciably exceed the number occurring naturally, its contribution to therapy is of doubtful value, especially when there are hazards of toxicity

# STREPTOMYCIN THERAPY IN HEMOPHILUS INFLUENZAE PULMONARY INFECTIONS

THOMAS M. DURANT, M.D., A. J. SOKALCHUK, M.D., CHARLES M. NORRIS, M.D., and CHARLES L. BROWN, M.D.
Philadelphia

The recent introduction of streptomycin as a therapeutic agent[1] has added another powerful antibiotic to the armamentarium of the physician. Especially is this agent of value since it is efficacious against many members of the gram-negative group of bacteria, organisms which are in no degree susceptible to the influence of penicillin. Included in this group of susceptible organisms is Hemophilus influenzae. The opportunity has been afforded us recently to study the effectiveness of this agent in pulmonary infections caused by this bacillus. Three cases so treated are reported in this communication. The first of these represents an overwhelming acute pneumonitis, and, because of the extremely dramatic response in a case that otherwise would no doubt have been fatal, the course in this case is reported in detail. In the second case the influenza bacillus infection represented an acute episode in the course of a chronic bronchiectasis. In the third there was persistent influenza bacillus infection following lobectomy for suppurative pneumonitis.

Clinical course in case 1. The sharp temperature spike on November 24 occurred in association with reaction to intramuscular administration of crude streptomycin.

## REPORT OF CASES

CASE 1.—P. S., a white man aged 56, had been a dye worker for about thirty years, exposed to the fumes of various acids, bleaching agents and dyestuffs. There had been a chronic cough for a number of years and annual episodes of acute bronchitis. He had considered himself essentially well, however, until three weeks before admission to the hospital, when he became extremely tired and had aches and pains in his back and legs. These symptoms were sufficiently disabling to render him unable to work. About one week later he developed chills and fever, together with a cough, which rapidly became productive of a large amount of purulent, yellow-green sputum. At this time both sulfadiazine and penicillin therapy had been instituted at home, but despite this the patient became progressively worse and required hospitalization.

He was admitted to Temple University Hospital at the beginning of the third week of his illness with a temperature of 103 F., pulse rate 108, respiratory rate 24 and blood pressure 124/70. He was dyspneic and slightly cyanotic and coughed incessantly, bringing up large quantities of purulent sputum which separated into three layers on standing. The heart was normal in size, the sounds were of good quality and there were no murmurs. Dulness was present over both lung bases, and throughout both lung fields there were coarse moist rales and rhonchi. There was no evidence of consolidation in either lung. The remainder of the physical examination was negative.

The urinalysis, blood serologic reaction and blood culture were negative. The blood count was negative except for a decided leukocytosis. Roentgenologic examination of the chest demonstrated bilateral lower lobe mottled densities with diffusively distributed small cavities extending higher in the right lung field than in the left. Bronchoscopy showed a high degree of acute congestion and thickening of the laryngeal and tracheobronchial mucosa. Large amounts of thick purulent secretion were encountered in the bronchial tree on each side. No obstructive lesion was found anywhere in the accessible bronchi. Bacteriologic studies of the bronchial secretions established Hemophilus influenzae, type B, as the predominant organism.

The course in the hospital is represented in the accompanying chart. On admission penicillin therapy was started in a dosage of 20 000 units intramuscularly every three hours. This therapy was without any appreciable effect, as would be expected from the bacteriologic findings which were subsequently reported. At the beginning of the second week in the hospital the patient's condition was critical; there was cyanosis and dyspnea despite oxygen therapy and repeated bronchoscopic aspirations, and the amount of sputum ranged from 30 to 40 ounces in twenty-four hours. It was at this time that streptomycin became available. The first administration of this material was by the intratracheal route, 50,000 units[2] being instilled into the bronchial tree. The solution used contained 10 000 units per cubic centimeter. The effect of this single administration on the production of sputum was dramatic. In contrast to the 6 ounces of sputum produced every four hours, on the average, prior to this instillation, the next eight hours witnessed the production of only 5 cc. of sputum. Examination of the chest at this time revealed no evidence of retained secretions; in fact, the rales were noticeably less numerous. Eight hours after the bronchoscopic treatment parenteral administration of purified streptomycin by intramuscular drip was started. Twelve million units of this purified material was available, and this amount was given over a period of slightly more than two days. No reactions were noted. After the supply of purified material was exhausted, treatment was continued with a less purified preparation. Although the condition of the patient had much improved at this time, it was deemed advisable to do this despite the risk of possible reaction, since it was not certain that the infection was completely under control. Four million units of this material was administered over a period of two days by the intramuscular route. This was done intermittently, since severe reactions were encountered and it was finally necessary to discontinue entirely. The reactions to the crude material were almost purely sympathomimetic in character. The patient would become restless and even irrational, and the blood pressure would rise rapidly to as high as 172 systolic, the pulse rising to as much as 132 and the respirations to 48. The skin and conjunctivas would become blanched and the abdomen distended, and the muscles of the arms and legs would twitch. At some

2. The units of streptomycin as reported in this article may be translated into weight of streptomycin base as follows: 1 unit equals 0.001 mg. of streptomycin base, 1 000 units equals 1.0 mg. of streptomycin base and 1 000 000 units equals 1.0 Gm. of streptomycin base.

time during the reaction a cold clammy perspiration would develop The reaction would subside within one or two hours after the drug was stopped Throughout the entire period of intramuscular administration, intrabronchial instillations were continued at almost daily intervals 50,000 units of the crude material being instilled on each of five occasions

The response to the streptomycin therapy was dramatic Not only did the temperature, pulse and respiratory rate show rapid improvement, but the dyspnea, cyanosis and cough were rapidly lessened and the appetite and strength improved in a remarkable way The response in the hematologic findings is recorded in the accompanying table The first of these blood counts (Nov 14, 1945) was that done on admission to the hospital The second (November 21) represents the count on the day on which streptomycin administration was started The third and fourth were taken during the period of administration and the last two followed the discontinuation of the antibiotic therapy The bronchial secretion continued to show Hemophilus influenzae in greatly reduced numbers until November 21 Following this none of these organisms were found

The streptomycin susceptibility of Hemophilus influenzae found in this case was such that the organism was inhibited by 0 5 unit of streptomycin per cubic centimeter of medium [1] On November 24 the blood streptomycin level was 15 units per cubic centimeter of plasma The bronchial secretion on the same day showed a streptomycin concentration of 10.2 units per cubic centimeter On November 26 the concentration in the blood was 11 8 units per cubic centimeter of plasma

The roentgenogram taken one week after the termination of streptomycin therapy indicated resolution of the pneumonic process in both lungs During the last four days in the hospital the rectal temperatures were entirely within normal range. The patient was discharged from the hospital nineteen days from the date of admission Except for some dyspnea on exertion he has remained well since discharge

CASE 2—I S a student nurse aged 19, had had a chronic cough for six years One year before admission to the hospital this cough had become productive of purulent sputum, and lipiodol bronchography had shown bilateral lower lobe cylindric bronchiectasis Bilateral maxillary sinusitis also was found. During the ensuing year there had been repeated upper respiratory infections, each of which aggravated the symptoms of the bronchiectasis but in each instance the intramuscular administration of penicillin had resulted in prompt improvement. In October 1945 she was admitted to Temple University Hospital for an intensive course of intramuscular penicillin and conservative, though intensive, treatment of the sinuses She then felt quite well following discharge from the hospital until December 1945 when she contracted a severe sore throat and her temperature rose to 102 F Examination at this time showed coarse rales at both lung bases but no signs of consolidation She was given 20 000 units of penicillin intramuscularly every two hours and admitted to the hospital the following day The sputum was then frankly bloody for the first time in the course of her bronchiectatic disease, and it was considerably increased in quantity The chest roentgenogram showed an extensive pneumonitis in the right lower lobe with mottled and stringy densities The increased markings previously noted at the left lung base were unchanged The white blood cell count was 5,350 with 74 per cent polymorphonuclear neutrophils Culture of the bronchial secretions revealed many Hemophilus influenzae organisms resistant to penicillin and very susceptible to streptomycin. There were a few viridans streptococci and an occasional hemolytic streptococcus and Neisseria flava

The temperature followed a septic course, ranging from 97.2 to 102 4 F for the first seven days in the hospital On the seventh day 50 000 units of crude streptomycin was introduced intrabronchially The temperature fell to normal dramatically following this instillation and reached as high as 99 F only once thereafter The sputum became much reduced in amount and was no longer bloody There was improvement in the general appearance and feeling of well being of the patient Three more instillations of streptomycin were given over a period of eight days The patient is now in excellent condition, and pulmonary surgery is contemplated in the near future.

CASE 3—W M, a white man aged 50, was first seen on Aug 29, 1945 complaining of cough productive of foul sputum with frequent hemoptyses and occasional febrile attacks Roentgenographic examination of the chest showed abnormal mottled density throughout the left lower chest, with an abscess cavity about 3 cm in diameter On bronchoscopy large amounts of odorous blood-stained purulent secretion were encountered in the left main and lower lobe bronchi and appeared from the branch bronchi of the left lower lobe on cough There was no obstructive lesion in any of the accessible bronchi Cultures of the secretion obtained bronchoscopically showed anaerobic hemolytic streptococcus group A with many Hemophilus influenzae organisms and a few viridans streptococci Roentgenograms made following instillation of lipiodol for bronchography showed advanced saccular bronchiectasis involving all segments of the left lower lobe except the superior with cylindric and mild saccular bronchiectasis in the lingular portion of the left upper lobe A subsequent bronchogram demonstrated no abnormality of the bronchial tree throughout the right lung

Improvement on conservative treatment, including postural drainage and bronchoscopic aspiration, with oral sulfadiazine penicillin by intramuscular injection and inhalation transfusions and other supportive measures was not satisfactory after a two month period Lobectomy was decided on, and this was performed by Dr W Emory Burnett on October 31 with removal of the entire left lower lobe and the lingular portion of the left upper lobe.

Convalescence appeared satisfactory the pleural drainage tube was removed on the sixth day, there being no evidence of pleural infection and the temperature followed an essentially normal course after the thirteenth postoperative day However, a roentgenogram on November 13 showed that the remaining portion of the left upper lobe had failed to expand, and bronchoscopy the following day revealed large amounts of unusually viscid purulent secretion occluding the left bronchus Cultures of the secretion showed many Hemophilus influenzae organisms and a moderate number of Neisseria catarrhalis organisms Several bronchoscopic aspirations were performed during the ensuing three weeks The roentgenograms on November 16 showed some reaeration but on the 28th again demonstrated complete airlessness of the remaining portion of the left upper lobe Large quantities of thick secretion were found at each bronchoscopy and cultures on November 16 and 30 showed many H influenzae organisms very susceptible to streptomycin and a few hemolytic streptococci group A moderately susceptible to streptomycin

Streptomycin was then given by intratracheal instillation daily for six days 5 cc. of a solution containing 10 000 units of streptomycin per cubic centimeter being employed and gravitation of the solution into the left bronchus being favored

[1] The medium used was streptomycin agar (Stebbins, with added blood

by posture. The amount of secretion seen bronchoscopically diminished rapidly, and cultures showed only a few H influenzae organisms Bronschoscopic cultures three days after the last instillation showed no H influenzae organisms or hemolytic streptococci Complete reaeration was evident on the roentgenograms of Dec. 8, 1945 and Jan 10, 1946 and the patient is now clinically well

### COMMENT

The first of these patients represents a therapeutic response of an extremely dramatic type His acute suppurative pneumonitis may well have been superimposed on a preexisting bronchiectasis, but whether or not this is true, the infection with type B Hemophilus influenzae constituted a serious threat to his existence and there can be little question from a careful survey of his case record that he owes his life to streptomycin The organism was shown to be extremely susceptible in vitro to this antibiotic, and the blood concentrations which were obtained by a combination of intramuscular and intrabronchial administration exceeded this susceptibility by as much as thirty times It is impossible to estimate which of the two routes of administration used was the more effective in controlling the infection However, it is of great interest that improvement had already been apparent in the eight hour period between the first intrabronchial administration and the commencement of the intramuscular administration Especially should it be noted that the sputum output dramatically diminished during this eight hour period It is our impression that intrabronchial administration played an extremely important part in the outcome of this case

The second and third cases did not represent as severe infections as the first, but in each Hemophilus influenzae was responsible for a very distressing and potentially serious complication in the course of chronic suppurative pulmonary disease In these 2 cases treatment was limited to intrabronchial administration of crude streptomycin, the reason for this being the limited supply available In each instance the response was prompt and clearcut, leading to a disappearance of the complicating infection, and in the last case, of the associated atelectasis These 2 cases, in which necessity dictated the employment of the intrabronchial route alone, lend support to our impression that this route allows a satisfactory and effective approach to pulmonary Hemophilus influenzae infections

Reactions to the administration of streptomycin were noted only in the first case, and then they occurred solely following the administration of crude material intramuscularly, a procedure which we do not recommend but which was dictated by the lack of pure material and the urgency of the situation During the period in which the purified streptomycin was being introduced intramuscularly there were no auditory symptoms or other unfavorable manifestations whatever

### SUMMARY

The effectiveness of streptomycin therapy in type B Hemophilus influenzae pulmonary infections was demonstrated in 3 cases The intrabronchial route of administration of the antibiotic was alone effective in 2 cases, and in 1, an extremely severe acute bilateral suppurative pneumonitis, the combination of intramuscular and intrabronchial routes was used effectively No reactions were observed except when a crude preparation was administered intramuscularly

## HEPARIN THERAPY IN ACUTE DEEP VENOUS THROMBOSIS

GUNNAR BAUER M D
Mariestad Sweden

In the summer of 1940 at the Mariestad Hospital a method was introduced for treating thrombosis of the deep veins of the leg, the main principles of which were (1) early diagnosis, (2) intensive heparin treatment and (3) early mobilization This procedure has now been in routine use without an alteration for more than five years

The combination of measures characterizing this method was the result of studies on thrombosis and embolism which have been in progress at Mariestad since 1938 In the course of these investigations phlebograms were made on nearly 600 patients, all relevant clinical data being at the same time noted and compared with the roentgenologic findings The con

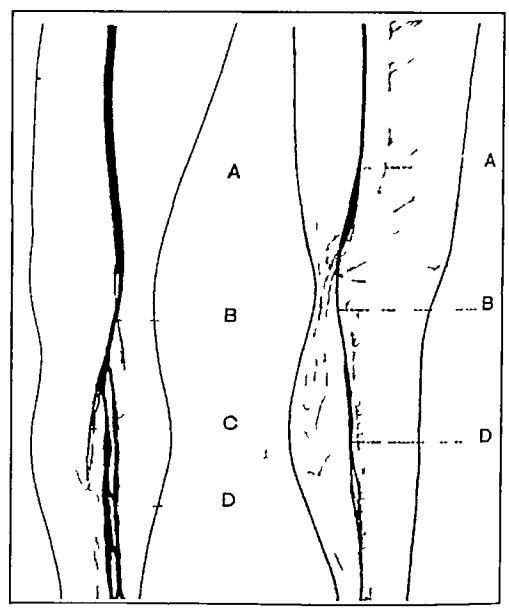

Fig 1—Diagrammatic representation of normal phlebogram at left, posteroanterior view at right lateral view *A* femoral vein *B* popliteal vein *C* posterior tibial vein *D* fibular vein

ditions in acute deep thrombosis of the leg were studied in 246 cases In another group, nearly as large, an examination was made of what might be called the chronic stage of the disease, i e the fate of thrombosis patients in the decade to follow The normal anatomy of the veins of the leg was also ascertained, about 130 phlebographs and a number of dissections being made for that purpose (fig 1)

As a result of these investigations some facts were established concerning the origin and course of the thrombo-embolic disease which seemed able to throw fresh light on several points in this field and at the same time to provide the means of making certain a very early diagnosis Since these facts form the background to the treatment used in Mariestad, as I believe they will to any other rational therapy, they will be briefly set forth here before a detailed description of heparin treatment is entered upon

From the General Hospital Mariestad Sweden surgeon in chief Dr Gunnar Bauer

## STARTING POINT AND COURSE OF ACUTE THROMBOSIS OF THE DEEP VEINS

As was pointed out in previous papers,[1] from the beginning it was considered necessary to make a definite distinction between two different forms of venous disease It is now almost generally agreed that thrombophlebitis is a primary disorder of the wall of mainly the subcutaneous veins secondarily followed by a thrombotic obliteration of the venous segment attacked This disorder will not be dealt with here Solely the large, deep veins of the leg will be considered in the present paper In these the clotting of the blood is the primary factor, and only secondarily is the wall of the vein drawn into the pathologic process Acute thrombosis of the deep veins is the term that ought to be employed by those who do not prefer the expression phlebothrombosis introduced by Ochsner and De Bakey[2]

Up to 1936 the thrombotic process was universally considered to commence in the femoral or pelvic veins Investigations during the following years by pathologists and later also by clinicians made it increasingly probable that in a considerable number of cases the process begins in the lower part of the leg instead (Homans,[3] Ochsner[4] Hunter,[5] Bauer[6])

These investigations, however suffered from the fault that they were based almost entirely on autopsy material Not until phlebography had been taken into use was it possible to carry research a step further and make studies direct on the living subject Using the x-ray technic described in earlier papers[7] I was able[8] in the year 1940 to submit a definite theory regarding the origin as well as the further course of acute thrombosis of the deep veins This theory has been confirmed by subsequent investigations at the Mariestad Hospital, now covering about 250 cases of this type The course followed by the disease appears in brief, to be that described here

The whole process begins with a thrombus, which arises for some as yet unknown reason in a muscle vein and projects into the lumen of one of the large venous trunks of the lower part of the leg Here it becomes the starting point of a deposition thrombus which continues growing upward in the direction of the blood stream

The next stage is for the large veins of the lower part of the leg to become progressively filled and for the thrombotic mass gradually to occlude the entire lumen and become attached to the vessel wall (fig 2) Concurrently in at least 80 per cent of the cases there is a longitudinal growth up the femoral vein Thus this vein will contain, at a certain stage freely waving about in the blood stream, an eel-like formation, dark red, with a smooth, slippery surface and sometimes up to 40 to 50 cm in length The thrombus forms as it were, a cast of the lumen of the large vein, though it does not completely occlude it The wall of the vein is as yet not involved in any way, and the thrombus is anchored only at its lowermost end far down in the lower part of the leg

This condition, which obviously entails a great risk of embolism, does not generally last more than twenty-four to forty-eight hours Within that time a development takes place which may proceed along two different lines One is that the waving thrombus, by breaking off at some point or other, gives rise to an embolus By far the commonest development, however, is for the thrombus to continue growing in thickness block up the lumen of the femoral vein, begin to involve the endothelium and to become attached to the vascular wall along its entire length A typical phlegmasia alba dolens arises (fig 3)

A sufficiently large number of cases were observed at the Mariestad Hospital to convince us that this is the natural course followed by thrombosis when no countermeasures are taken The starting point of the clotting process was in the lower part of the leg in all cases except 3 among 190, i e in more than 98 per cent of the cases, and there are phlebograms to demonstrate all the different phases of evolution from the initial clot not more than a few centimeters in length in one of the main trunks of the fibular vein to the complete obliteration of all deep venous channels Also there is evidence to show that, as long as there is no more than a waving thrombus, the vein itself is in no way affected It is not until the thrombus begins to fill up the whole lumen and attach itself to the vessel wall that the latter begins to be irritated and gradually becomes the seat of an aseptic inflammatory process This results on one hand, in the firm rooting and, later on organization of the thrombus, and, on the other hand, in a phlebitis and periphlebitis which gives rise to fever, tenderness on palpation and vasospastic reflexes When the vein attacked, as for instance in the lower part of the leg, is comparatively small, the clinical phenomena will not be so pronounced as when the powerful femoral vein is attacked As in addition, the phlebitis always appears to be secondary to the thrombosis there seems to be hardly any reason to differentiate an "ileofemoral thrombophlebitis" as a special entity

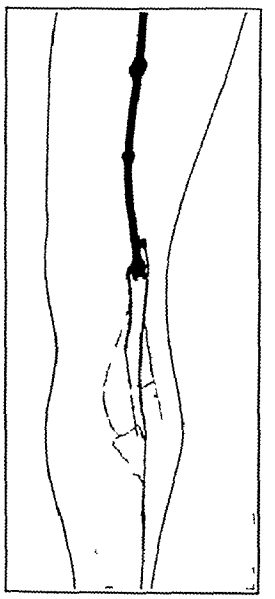

Figure 2

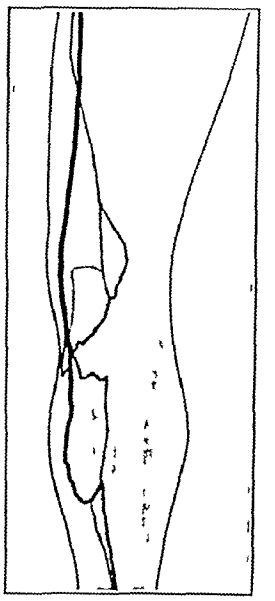

Figure 3

It may finally be mentioned that in untreated cases thrombosis also appeared in the other leg in at least 30 per cent of the cases Phlebography showed that as a rule the thrombosis there also started in the lower part of the leg

### THE SUBSEQUENT FATE OF THROMBOSIS PATIENTS

The different stages of the process, once the thrombosis has developed the classic clinical symptoms, are too well known to need description In general, after about six weeks in bed and a further period of convalescence, the patients have been allowed to leave the hospital, with one or both of their legs still much swollen, and finally, after a still further lapse of time, they have generally been able to resume their work

The fact has been but little known, however, that even then the disease is not overcome On the contrary, it passes into a chronic stage, and most of those who have suffered from thrombosis have to look forward to after-effects of a very serious nature On this aspect our knowledge up to the present has been highly defi-

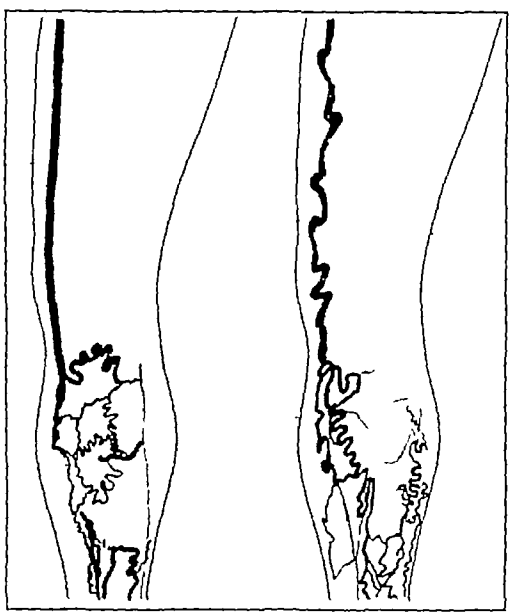

Fig 4 —At left chronic thrombosis of long standing Far advanced degeneration of superficial veins of lower part of leg Great saphenous vein still straight Swelling and induration present At right chronic thrombosis still older Degeneration and tortuousness of great saphenous vein also apparent. Swelling induration and ulceration present

cient, and no follow-up investigations appear to have been made on the subject Homans,[9] however, in 1939 suggested that, at least in some of the patients, chronic ulcers on the lower part of the leg may be due to deep thrombosis suffered earlier in life, and Birger [10] observed this etiologic factor in at least one third of his patients In pursuance of our phlebographic studies on the thrombotic disease at the Mariestad Hospital, we widened our investigations to include the roentgenographic appearance of the venous system in thrombosis sequelae and in this connection also took in the clinical aspects The results obtained have already been described in an earlier paper [6] The following is a brief account of what was found

After the deep blood channels in the leg have been destroyed by thrombosis, recanalization of these veins practically never occurs For the rest of the patient's life the drainage of the venous blood from the lower part of the leg is taken care of by an accessory system of veins consisting exclusively of subcutaneous veins, usually with the great saphenous vein acting as the chief carrier of the venous return (fig 3) As long as these superficial veins are intact they are capable of transporting the blood from the lower part of the leg in a satisfactory manner A mild state of venous stasis is always present, however, causing chronic edema in the lower part of the leg As a result of unfavorable emptying conditions and of constant overloading there arises in the accessory system during the course of the years a state of degeneration which is manifested in the fact that the superficial veins become distended and tortuous and the valves defective (fig 4) This degeneration causes nutritional disturbance and leads in time to the appearance of the typical, leathery indurative lesions on the lower part of the leg and to leg ulcers

These lesions, which up to the present have almost always been thought to be due to varices, were instead caused, in our material, in 80 to 90 per cent of the patients by an earlier deep thrombosis The generally used name varicose ulcer ought therefore, by rights, to be changed to post-thrombotic ulcer

According to figures worked out from the investigations in Mariestad and recently corroborated in a report by Zilliacus [11] from other Swedish clinics, it looks, in fact, as though the ultimate fate of patients who have once suffered from deep thrombosis in the leg and received no specific treatment is that they all have permanent swelling of the leg, and more than nine tenths acquire indurative lesions and about four fifths leg ulcers

### EARLY DIAGNOSIS OF THROMBOSIS

It must be considered as highly desirable to make as early a diagnosis as possible of the thrombosis, preferably while it is still confined to the lower part of the leg Only by this means will it be possible to intervene early enough to prevent the occurrence of otherwise fatal pulmonary emboli by ligation of the vein or by means of anticoagulants Those making use of the rapidly acting heparin also have by that means the possibility of stopping the thrombotic process already in the lower part of the leg, preventing thrombotic obliteration of the popliteal vein and thereby saving the patient from late thrombotic troubles

Up to the present, however, it has been difficult to make a sufficiently early clinical diagnosis The text books, it is true, supply detailed descriptions of the fully developed, well known stages of thromboembolic disease, but they contain surprisingly little information as to how the thrombosis can be detected at a much earlier stage Now, as knowledge spreads that the thrombosis almost invariably starts in the lower part of the leg, it is beginning to become clear that it is there a search ought to be made for the earliest signs A report of the experiences gained at the Mariestad Hospital were published as early as 1941 by Bauer and Hellsten [12] and have since been further developed,[13] but there is no reason to enter closely into these points here, as they are well known by all authors who have acquired a modern view of the thrombotic question Summing up, it may be said that every inexplicable rise of the pulse and temperature curves, as well as symptoms from the lungs in the form of even slight pain or stitch in one side of the chest, must always arouse suspicions that thrombosis may be present and should

lead to an examination of the lower part of the patient's leg Of course, if a pronounced swelling and cyanosis and intense tenderness along the back of the calf are then found, there can hardly be any doubt of the diagnosis Unfortunately, however, this is then already somewhat too late The fact is that at this stage, as phlebography shows, there is often already a long waving thrombus in the femoral vein, immediate embolism threatens, and the popliteal vein is frequently beyond helping Diagnosis at a considerably earlier stage must be the goal, but, as only relatively small venous areas are then as yet attacked, the clinical signs are correspondingly less pronounced At Mariestad we found that tenderness over a certain segment to palpation from the back of the calf into the depths was the most constant sign and made thrombosis a probable diagnosis Our experience showed, however, that neither alone nor in combination with a mild swelling of the calf muscles and spontaneous pains was this symptom a sure indication that thrombosis was present Recourse was had to phlebography in all such patients, and it was found that one third to one half of them were free from thrombosis These accordingly received no treatment of any kind, and not one of them subsequently developed the slightest symptoms indicative of thrombosis

Thus, in our opinion, all cases showing very vague symptoms, a condition desirable in itself, require roentgenologic control before therapy is commenced, in any case if the latter is intended to be of such a drastic nature as ligation of the femoral veins or higher up There are, however, also cases with seemingly more pronounced symptoms in which it nevertheless cannot be said with certainty that thrombosis is present, e g with legs already swollen or tender on account of fracture, traumatism or local inflammatory processes, including superficial thrombophlebitis According to the opinion to which we have come, phlebography should constitute a routine method at all hospitals in all cases of suspected early thrombosis

It may be added that it is obviously impossible to handle a series of cases strictly scientifically without making sure in every case by roentgenologic control that the trouble present is actually thrombosis

According to our experience, summarized in a recent paper,[14] the interpretation of the x-ray pictures does not give rise to difficulties or false conclusions, provided careful technic is observed and some experience is at hand

## HEPARIN THERAPY

At the Mariestad Hospital we were in rather a unique position in 1939 and the beginning of 1940 We had suddenly come in possession of a method of diagnosing a thrombosis in its initial stage, but we found ourselves unable to prevent the process from following the path we only too well knew it would take During this period we were faced on 29 occasions with cases in which phlebography disclosed that an incipient thrombotization of the lower part of the leg was present As no effective therapy was available, we had the painful experience of remaining inactive and seeing how the process in 24 cases spread after one or two days to the femoral vein and brought about a phlegmasia alba dolens In 5 cases there was a propagation to the large pelvic veins Pulmonary embolism occurred in 11 cases, 2 of which were fatal In 10 cases the other leg also was attacked by thrombosis

The number of deaths would probably have been still higher if recourse had not been taken to ligation of the femoral vein in 2 cases with iterated pulmonary infarcts On 1 occasion we were strongly minded to introduce this treatment as a routine method, but the knowledge we were just then acquiring respecting the late results of thrombosis, when the popliteal and femoral veins were put out of function, kept us from doing so

It was in this position that we decided to make a trial with heparin

Concerning this drug, a fair number of facts, exhaustively reported by Jorpes [15] and by Crafoord and Jorpes [16] had at that time accumulated Sorting these out, it appeared to us as though prophylactic treatment could be ruled out as a routine method and also that treatment of fully developed thrombosis cases had not yielded results that were fully satisfactory, even if Murray [17] had been rather successful in a series of cases of embolism or thrombophlebitis However, being in possession of a method of diagnosing thrombosis at an earlier stage than had formerly been possible, it occurred to us that if heparin was to be introduced at such a moment a better result might be expected Accordingly, after consulting Jorpes and Crafoord as to the size of the heparin doses, we started treatment along these lines in October 1940 From the outset the results were favorable, and it was found that the entire course of the disease was completely changed No spreading of the thrombotic process occurred, and fever, swelling and pain disappeared in a surprisingly short time The patients were, as a rule, able to leave their beds in less than a week completely healed

In December 1940 at the joint meeting of the Swedish Surgical and Medical associations I [8] had the opportunity of presenting the first 21 cases of this abortive treatment of thrombosis, the main features of which were (and are) (1) early diagnosis, (2) immediate intensive heparinization, (3) movements of the leg from the beginning and (4) getting the patient out of bed the moment the acute thrombosis symptoms disappear, before the termination of heparin injections

These precepts, which have not been altered in any way, were applied in the treatment of all thrombosis patients at the Mariestad Hospital for more than five years The technic, results and other points of interest will now be discussed

## THE TECHNIC IN HEPARIN TREATMENT

The technic used in the Mariestad Hospital was as follows

The heparin was administered by intermittent intravenous injections The brand of drug used was that manufactured in Stockholm by Vitrum & Co, Ltd, under the supervision of Dr Jorpes The Swedish heparin contains 80 international units per milligram of water-free substance

Immediately after the diagnosis of thrombosis (or pulmonary embolism) had been made, 150 mg of heparin was administered Depending on the time of day at which the treatment was started, a further one or two doses of the same size were given An interval of four hours was always allowed to elapse between doses however The last dose was given late

at night On the following days three to four injections were usually given, with early morning and night doses of 150 mg and a mid-day dose (or doses) of 100 mg After a few days the temperature generally returned to normal (or to a level only a few tenths of a degree C above normal), and the swelling and

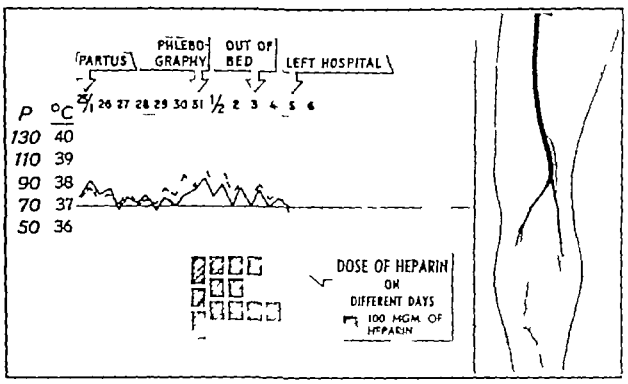

Fig 5—A typical example of abortive treatment with heparin On sixth day after normal partus rise in temperature and pulse rate and slight tenderness on palpation over middle third of calf On phlebographic examination no contrast filling of deep veins of lower part of leg but femoral vein normal Thus incipient thrombosis still confined to lower part of leg Heparin treatment instituted First day 150 + 100 + 150 mg of heparin Second and third days 100 mg three times a day After that successively reduced doses Total dose of heparin 1 300 mg Result On third day all tenderness disappeared and temperature normal Patient allowed to get up On fifth day patient discharged after being supplied with an Unna's paste stocking

palpation tenderness in the leg disappeared The heparin doses were then decreased to two injections of 100 mg, and on the last day to an evening dose alone The treatment was then at an end (fig 5) During the entire treatment the patient was allowed to move about freely in bed and was made to execute whole series of bending and stretching movements of the legs at intervals throughout the day On the day the heparin doses were first decreased he was allowed to get up and even to walk about a little The length of time out of bed was increased each day, and as a rule the patient could leave the hospital two or three days after first getting up

When leaving bed he was provided with an elastic bandage on the foot and the lower part of the leg in order to counteract the mild swelling generally arising in this region in the evening during the first few weeks The bandage may be an elastic dressing or a length of tricot tubing, at Mariestad we generally used an Unna's paste stocking This bandage was worn for only two or three weeks At the end of this time most of the patients were capable of resuming their work

We found it of the utmost importance that the patients should get up when or, rather, before the heparinization is terminated Most of the failures experienced with heparin treatment are due to the fact that this rule is not observed This was the case, for instance, in regard to at least one of the deaths in the Mariestad Hospital As a rule, the explanation of the failures is probably that, owing to old prejudices, doubt is felt as to the wisdom of allowing a thrombosis patient to move about It should be stressed, however, that when heparin is no longer being administered the patient is even on the following day totally unprotected against, and open to, the risk of a fresh thrombosing process The best way in which this risk can be counteracted is to allow the patients to get up and begin moving about

In certain conditions this rule is naturally inapplicable, such as, for instance when the patient's main disease prevents him from getting up (e g in fractures of the lower extremity, when it is impossible for the patient to walk, and in many internal cases) These cases are not infrequently encountered Our practice was then to insure as good a blood circulation as possible in the limb by making the patients perform all the tension and relaxation exercises of the muscles that are practicable within a plaster cast and also by giving what we called a protracted heparin treatment (fig 7) After the acute signs of thrombosis had subsided and the actual heparin therapy terminated, we continued to administer to these patients an evening dose of 100 mg each day for, at the most, one week After that, one injection every other evening was given for another week, and then a couple of injections every third evening The treatment was then discontinued The body, it was thought, may then be regarded as having adapted itself to the new conditions, and the risk of a recurrence of thrombosis is probably no greater than it is in any other patient confined to bed This procedure was adopted with 22 patients, and in none of them was there a recurrence In 2 of these cases of fracture it was even possible, nineteen and eight days respectively after the temperature had returned to normal, to perform an osteosynthesis on the tibia without the slightest sign of thrombosis appearing during the subsequent course

As regards the cases in which the disease made its first appearance as a massive pulmonary embolism the treatment followed the same lines as those already described During the first twenty-four hours, however, we found it advisable to administer heparin (150 mg) every four hours The customary eupaverin treatment was not neglected [18]

If a phlegmasia alba dolens was already manifest before the beginning of treatment (as was often observed in patients sent in by practitioners), this too did not materially influence the therapeutic rules that have been set down Some of these cases responded quite as

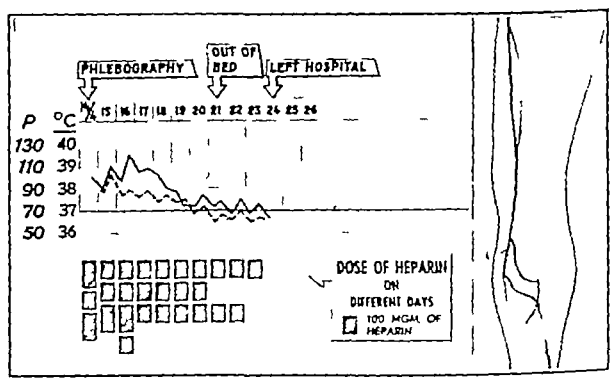

Fig 6—An example of heparin treatment in phlegmasia alba dolens Patient treated at home for postpartum thrombosis After a few days pulmonary embolism of medium severity developed and the patient was sent to the Mariestad Hospital On admission condition poor she was dyspneic and very restless Severe phlegmasia alba dolens in right leg Phlebographic examination revealed total absence of all deep venous trunks Thus, incipient thrombosis in both lower part of leg and thigh Heparin treatment instituted First days doses large after that successively reduced Total heparin dose, 3 000 mg Result Stitch and restlessness disappeared after first injection At end of two days during which temperature had continued to rise the fever rapidly subsided and all local symptoms disappeared On seventh day patient was symptom free and could get up On tenth day she was discharged with only minimal signs of leg swelling

rapidly to heparin treatment as very early cases, while in others somewhat larger doses and a slightly prolonged period of treatment were found necessary (fig 6)

18 Eupaverin is a proprietary name for methylene dioxy benzyl methyl methylene-dioxy isoquinoline a synthetic antispasmodic.

RESULTS OF TREATMENT WITH HEPARIN

For a period of five years which began Oct 1, 1940 and ended Sept 30, 1945, 209 cases of acute thrombosis of the deep veins of the leg were treated at Mariestad Hospital In practically all cases the diagnosis was verified with the aid of phlebography

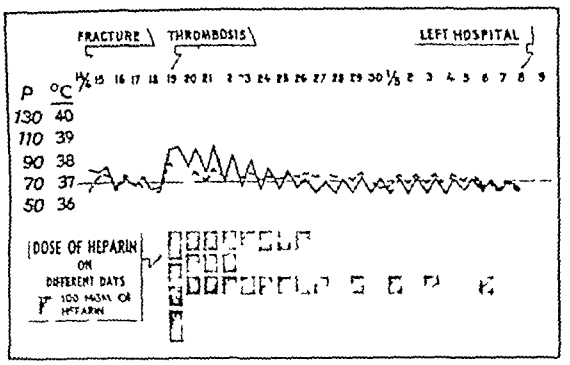

Fig 7—An example of heparin treatment when the patient is prevented from getting up immediately after termination of heparin treatment Five days after fracture of the tibia a rise in temperature and pulse rate and thrombosis in lower part of fractured limb Heparin treatment instituted. First day 150 + 100 + 100 + 150 mg After that successively reduced doses On fifth day (April 24) all local symptoms had vanished and temperature was normal Normally the patient ought now to have got up On account of fracture this was not possible Instead heparin in gradually diminishing doses was given both morning and evening during first few days then only in evenings then every second evening and finally every third evening Nineteen days after onset of thrombosis all risk of recurrence was considered to have passed, and patient was sent home to await normal healing of the fracture

Any judgment of the results should take cognizance of two questions (*a*) On what grounds is the judgment to be made? (*b*) How can a suitable material for comparison be obtained?

With respect to the first question, it is generally known that the dangers hitherto existing from the thromboembolic disease are associated with the following factors (1) A large group of the patients die of pulmonary embolism, (2) the survivors have to lie in bed for a long time on account of their thrombosis and during this time have great distress and are especially difficult to attend, (3) in the majority of the cases the thrombosis involves incapacitating after-troubles A newly introduced method of treatment must therefore be examined with regard to its effect on these three factors

As far as a suitable comparison material is concerned, this can be obtained from table 1, which has been drawn up after a comparative study of the largest series of conservatively treated cases of thrombosis that have been published, among them Robertson's [19] of no fewer than 2,196,841 surgical cases The frequency figure for traumatic cases is derived from a recent analysis made by me [20] showing that in such cases thrombosis is much commoner than has been supposed Nonetheless it seemed to me that the best picture of how the new method had worked would be obtained by making a comparison with material from the same hospital during another, sufficiently long, period during which the old, conservative method of treatment had been applied (table 2) An account follows of a study on these lines

An analysis of the two series with regard to the three factors according to which a comparison ought to be made shows the following

19 Robertson H E Am J Surg **41** 81 1938
20 Bauer G Acta chir Scandinav **90** 229 1944

MORTALITY

Among 264 cases of thrombosis in the ten year series there were 47 deaths caused by pulmonary embolism The thrombosis mortality was thus then 18 per cent, a figure that corresponds well with that given in table 1 for surgical cases During the five year period, on the other hand, only 3 of 209 thrombosis patients died The mortality therefore dropped to 1 4 per cent The mortality from pulmonary embolism among all patients admitted likewise fell from 0 2 per cent to 0 018 per cent Only 3 patients died during the heparin period, if the conservative procedure had been retained, it would have been necessary to reckon with 33 deaths, instead, during the same five years

As mentioned, however, there were 3 deaths In 1 of these, which occurred at the very beginning of the series, the patient already had a far advanced thrombosis on admission to the hospital On account of deficient experience she was not allowed to get up after completion of the heparin treatment, she subsequently had a recurrence of her thrombosis and a few weeks later died of an embolism springing from a fresh thrombosis in the other leg Another patient with peripheral thrombophlebitis was allowed to lie in bed without heparin treatment, a procedure we now know to be incorrect In an insidious manner there developed a deep seated thrombosis, which caused the pulmonary embolism that killed the patient before recourse could be had to heparinization The third patient was 70 years of age, was greatly debilitated and had suffered a fracture of the neck of the femur and had an uncompensated organic heart defect A massive thrombosis was discovered one evening and she was given a first heparin dose of 150 mg Three hours later a pulmonary embolism suddenly appeared and she died within a few minutes

In the first 2 lethal cases technical errors, as we now view the matter, were committed In the third the issue was fatal in spite of heparin The 3 cases are naturally regrettable, but they do not alter the fact that

TABLE 1—*Comparison of the Frequency and Mortality of Thrombosis in Certain Important Groups of Patients*

| | Frequency of Thrombosis | Mortality Among Cases of Thrombosis | Total Mortality from Thrombo embolism |
|---|---|---|---|
| *After surgical operations* | 1 61% | 10 0% | 0.26 % |
| After parturitions | 1.2 % | 3 6% | 0 033% |
| Among internal cases | 2.1 % | 19 % | 0 4 % |
| After trauma to lower extremity | (12 %) | | |

TABLE 2—*Comparison of the Thrombosis Material at Mariestad Hospital Sweden During a Ten Year Period When an Old Fashioned Treatment Was Used and a Five Year Period When Heparin Treatment Was Used*

| | 1929 1938 Conservative Treatment | 10/1/40-9/30/45 Heparin Treatment |
|---|---|---|
| Number of patients admitted | 25 628 | 16 495 |
| Number of thrombosis cases | 264 | 209 |
| Fatal embolism | 47 | 3 |
| Mortality among thrombosis cases | 18% | 1 4% |
| Total mortality from thromboembolism | 0 2% | 0 018% |

* Out of these 70 patients (two fifths) were admitted because of thrombosis which had been contracted in their homes or at other hospitals but had not received any treatment

since heparin was introduced at Mariestad Hospital the mortality from pulmonary embolism has dropped to less than one tenth of what it was before

It deserves special mention that during the whole heparin period, five years, not a single postoperative death occurred from pulmonary embolism. During this period the number of operations was about 7,000.

### DECUBITUS

The period during which a patient is compelled to remain in bed on account of his thrombosis has been made the subject of several investigations, among others by Hellsten,[21] Linde [22] and Jorpes [23] and may be regarded as determined. On an average it has amounted to six weeks, or about forty days. During the heparin period in Mariestad, on the other hand, all patients for whom the primary disease did not constitute an obstacle got up after an average period of 4.7 days. Thus the use of heparin shortened the period of attendance *by thirty-five days. It should also be mentioned* that the patients had no pain even during the few days they were confined to bed and, as previously pointed out, were not compelled to lie anxiously immovable but could move freely and were thus not in any way difficult for the staff to manage.

TABLE 3.—*Results of Heparin Treatment at Mariestad Hospital Compared with Conservative Treatment*

| | Conservative Treatment | Heparin Treatment |
|---|---|---|
| Mortality among thrombosis cases | 18% | 1.4% |
| Average duration of stay in bed | 40 days | 4.7 days |
| Incapacitating after-effects | Serious | None or very slight |

There is hardly need to stress the social significance of this improvement in the form of reduced hospital expenses, decreased claims on costly hospital beds and the early return of the patients to productive work.

### INCAPACITATING AFTER-EFFECTS

Judging from the experience gained at Mariestad Hospital, heparin exercises its chief effect by instantly stopping any further propagation of the thrombotic process. In an earlier work [6] it was shown—*inter alia*, by means of cases in which repeated phlebography was undertaken—that the thrombosis never propagated beyond the upper limit that it had reached at the moment the first heparin injection was given. This circumstance proved to be of great significance not only immediately but also, and in a still higher degree, for the subsequent course.

As was pointed out earlier in this paper, one of the not least harmful consequences of thrombosis consists in the serious after-effects that are as a rule involved. The social importance of the post-thrombotic leg ulcers and the amount of pain and risk of infection which accompanies the post-thrombotic state can hardly be overrated. In Sweden, for instance, Birger,[24] using statistical material from the State Pensions Bureau, has shown that so many new grants of life annuities are made each year on account of leg ulcers that, as a cause of disablement, this complaint outdistances such important illness groups as diabetes or tuberculosis of the bones and joints.

There seemed, however, to be a possibility of bringing about a change in this state of affairs with the aid of heparin, for in 149 of the Mariestad cases the thrombosis was discovered so early that it was then still confined to the lower part of the leg, and the heparin then prevented it from propagating to the popliteal vein, the thrombotic obliteration of which appears to be the factor that determines the arising of post-thrombotic troubles. Consequently these 149 cases were in all probability saved from this fate. Of course, whether or not this will actually be the case can be determined definitely only after five or ten years, but we made a preliminary follow-up examination that clearly pointed in this direction. Among 78 patients in whom between two and five years had elapsed since they had their heparin-treated thrombosis of the lower part of the leg, 62 exhibited an absolutely normal leg, while 16 periodically had a slight swelling of the lower part. No case of severe swelling, induration, ulcer formation or pain occurred.

### SUMMARY OF THE RESULTS

In table 3 a collection has been made of the results obtained from the method of treatment employed in Mariestad. With its aid the following were attained:

1. The mortality from thromboembolism was decreased to less than one tenth of what it had formerly been.
2. The length of stay in bed was reduced from about forty days to less than five days.
3. Incapacitating after-effects will probably not appear in the majority of the cases.

It does not appear unjustifiable to assert that as far as the treatment of thrombosis is concerned a veritable reformation was in this way established at the hospital.

In the course of years the treatment of thrombosis has been taken up on practically the same lines as in Mariestad by a number of clinics in Sweden. The results have been similar. An account of the total material will be given in another paper.

### COMPLICATIONS AND CONTRAINDICATIONS

Among those who are not acquainted with the properties of heparin there seems to be a tendency to believe that the use of this drug entails definite risks of bleeding. As against this it must be stated that the experiences gained at Mariestad Hospital were the diametrically opposite. On no single occasion did heparin give rise to either intra-abdominal, subcutaneous or other serious hemorrhages, hardly even to small bleedings, and was not at all combined with any demonstrable tendency to bleed.

The only complications of any kind that were observed consisted of a mild hematuria, which was observed in 3 cases. There was a very moderate admixture of red blood cells in the urine. The condition lasted for only two days at most and was not followed by other signs of renal irritation. It passed off of itself without there being any need to break off the heparinization or even reduce the doses. In 2 other cases there was a mild hemarthrosis of the knee joint, which had been operated on for laceration of the meniscus. The thrombosis appeared unusually early in these cases, i. e. two and three days respectively after the intervention. In both cases the heparin treatment, which had already gone on a few days, was broken off without the thrombosis flaring up as a result. Nor did any injury to

the knee joints arise On the other hand, a case was observed in which a strongly positive Weber reaction in the feces changed to a negative one during the course of a heparin cure

From what has been said here and from the general experience gained it appears that, as against other anticoagulants, there are hardly any contraindications to the use of heparin as a treatment for thrombosis This drug may doubtless be regarded as the body's own preventive of coagulation and diseases of the liver, kidneys or other parenchymal organs are in no way badly influenced by its use Puerperal bleeding was not affected, and existing traumatic hematomas were not enlarged We were not afraid of heparinizing even patients bleeding from gastric ulcers, nevertheless, some caution should probably be exercised in cases of that kind

SUMMARY

Investigations going on since 1938 and consisting in phlebographic examinations on nearly 600 patients, as well as coordinated clinical observations, gave evidence that acute thrombosis of the deep veins of the leg practically always (in 98 per cent) begins in the calf veins and from there propagates in the cranial direction

This knowledge makes possible a very early diagnosis of incipient thrombosis At the least suspicion the examination can at once be directed toward the lower part of the leg The clinical signs of thrombosis there are now becoming known The diagnosis should if possible be verified by phlebography

As soon as the diagnosis has been made, treatment should be instituted The method that I introduced consisted in giving these patients an intensive heparin treatment Forceful active leg movements were insisted on from the first day The patients were made to leave bed one day before the heparin cure was terminated

This plan of treatment was followed for more than five years, 209 cases of acute deep leg thrombosis were treated There was no death from postoperative pulmonary embolism Three fatal cases were recorded among the patients not operated on, 206 cases were cured In these, fever, leg swelling and pain disappeared so rapidly that the patients were able to leave bed after, on an average, 4 7 days

In comparison with material treated in the old conservative way, heparin treatment resulted in depressing the mortality to less than one tenth and in reducing the time of staying in bed from the previously customary forty days to about five days

There seems to be every probability that heparin-treated patients will as a rule, escape those troublesome after-effects, which, according to our experience, regularly appear in conservatively treated thrombosis patients and consist in permanent swelling of the leg and, later on, brown induration and ulcers

**Neglecting the Distant Consequences**—Human wisdom fails most conspicuously in passing judgment and acting on immediate needs and in neglecting the distant consequences This is intellectual shortsightedness—mental myopia Man—that is, the human race—has dwelt on this earth at least a million years It seems to me it is high time that those who would be wise should look ahead as to the consequences of their individual national and international actions not only today and tomorrow but a hundred, a thousand a hundred thousand years ahead—Carlson A J Is There "A Standard to Which the Wise and the Honest Can Repair?" *Science* **103** 577 (March 29) 1946

## EFFECT OF ANTEPARTUM VITAMIN K ON RETINAL HEMORRHAGE

HAROLD F FALLS M D, and HARRY N JUROW M D
Ann Arbor Mich

Does the antepartum administration of vitamin K influence the incidence of retinal hemorrhage in the newborn? Recent research in the field of hemorrhagic diathesis has proved the frequency of hemorrhages occurring in the newborn Hypoprothrombinemia was suggested by Lucas, Dearing, Hoobler, Cox, Jones and Smyth [1] as the possible etiologic factor of bleeding tendencies in the newborn With the advent of an accurate and simple method of blood prothrombin determination,[2] much information concerning so-called hemorrhagic diseases of the newborn became available It is to be recalled that a fall occurs in the prothrombin concentration of infant blood during the first few days of life [3] This drop begins about the second and continues to the fifth day of life [4] Infant bleeding developing during this period has been attributed to this lowered blood prothrombin level Maumenee, Hellman and Shettles [5] observed that retinal hemorrhages appeared more frequently in newborn infants having lower prothrombin levels than in infants with normal levels The same authors maintained that the incidence of retinal hemorrhages could be reduced materially by the administration of vitamin K to the mother during labor Maumenee and his co-workers also held that if vitamin K was given prior to the onset of labor the incidence of hemorrhage could be practically eliminated Hellman, Moore and Shettles [6] were able to elevate the blood prothrombin level in infants by feeding vitamin K directly to the infant or by the administration to the mother prior to delivery Sharp, Konder Heide and Good [7] attributed a curative effect of vitamin K in the hypoprothrombinemic states The early enthusiasm accorded vitamin K as a preventive of infant bleeding has been dampened by more recent investigation Sanford, Schmigelsky and Chapin [8] reported that they had been unable to show that hemorrhagic manifestations in the newborn were associated with a prothrombin deficiency They also maintained that the incidence of such hemorrhages does not appear to be lessened by the administration of vitamin K Maumanee and his associates [5] were unable to establish a correlation between the extent of retinal hemorrhage and the degree of hypoprothrombinemia

PROCEDURE

The fundi of 432 consecutive infants were examined at the Maternity Clinic of the University of Michigan Hospital twenty-four to forty-eight hours after birth Homatropine 0 5 per cent was employed as the mydriatic and was instilled in both eyes at intervals of five minutes until sufficient dilatation was present to permit adequate funduscopy The fundi were examined one-half hour before the 2 p m feeding of the infants

Throughout the entire study the ophthalmologist was not permitted to know which infant's mother had or had not received vitamin K The fundi were examined within twenty-four to forty-eight hours after birth, since many superficial flame shaped retinal hemorrhages disappear within that period Fundi exhibiting hemorrhagic changes were followed daily until the retinas were clear Normal fundi were followed for seventy-two hours No attempt was made to classify the retinal hemorrhages as to extent, type or shape

Eighty-three of the 432 cases were followed by determining the prothrombin time of the infants seventy-two hours after birth and again at nine days after birth The technic employed was the micromethod of Kato [9]

TABLE 1—*Multiparas versus Primiparas*

| Groups | Percentage of Retinal Hemorrhages |
|---|---|
| Multiparas | |
| Received no vitamin K | 51 5 |
| Received vitamin K | 20.3 |
| Primiparas | |
| Received no vitamin K | 23 0 |
| Received vitamin K | 37 7 |

TABLE 2—*Duration of Labor*

| Groups Not Receiving Vitamin K | Duration of Labor |
|---|---|
| With hemorrhage | 9 0 hours |
| Without hemorrhage | 9 8 hours |
| Groups Receiving Vitamin K | |
| With hemorrhage | 12 5 hours |
| Without hemorrhage | 12 0 hours |

TABLE 3—*Retinal Hemorrhage*

| | Number of Patients | Retinal Hemorrhages | |
|---|---|---|---|
| | | Number | Percentage |
| Received vitamin K | 151 | 47 | 31 1 |
| Did not receive vitamin K | 281 | 94 | 33 4 |
| Total | 4 2 | 141 | 32 6 |

TABLE 4—*Prothrombin Time Without Vitamin K*

| | Number of Cases | Average Prothrombin Time |
|---|---|---|
| Received no vitamin K | | |
| No retinal hemorrhage | 33 | 77% |
| With retinal hemorrhage | 17 | 70% |

Commercially prepared thromboplastin was employed for the test, and this preparation was checked each day against a known normal blood prior to determining the prothrombin time of the infant

The prothrombin time was checked in infants (1) from mothers who had received no supplementary vitamin K and (2) from mothers who received vitamin K in various amounts For the most part the mother received this medication in the form of menadione tablets orally, 1 to 2 mg every three to four hours during labor Some mothers received 2 mg of "Synkamin" [10] orally every day for a period varying from two to twenty-two days before delivery

OBSERVATIONS

The data obtained by this study were classified as to effect on the incidence of retinal hemorrhages in the newborn and also in relation to the age of the mother, multiparas versus primiparas, duration of labor, method of delivery, position of the fetus, sex of the baby, weight of the baby and the type of maternal pelvis

HEMORRHAGIC INCIDENCE CORRELATED WITH MATERNAL AGE

The average age of the group of mothers whose infants displayed retinal hemorrhages was 24 5 years, whereas that of the group not displaying retinal hemorrhages was 25 4 years Whether vitamin K was administered or not, the age of the mother bore no significant relation to the incidence of retinal hemorrhages in the newborn

MULTIPARAS VERSUS PRIMIPARAS

Table 1 tends to indicate that vitamin K administered to multiparas reduces the incidence of retinal hemorrhage, while in primiparas the incidence of hemorrhage tends to increase These findings are not entirely clear

TABLE 5—*Prothrombin Time with Vitamin K*

| | Number of Cases | Average Prothrombin Time |
|---|---|---|
| Received vitamin K | | |
| No retinal hemorrhage | 29 | 89% |
| With retinal hemorrhage | 8 | 92% |

They can be partly explained by the fact that the two groups were not homogeneous, since the group which received vitamin K was made up of 57 per cent multiparas while the group not receiving vitamin K was only 31 per cent multiparas

RELATIONSHIP OF THE DURATION OF LABOR AND RETINAL HEMORRHAGE

The average length of labor in groups with and without retinal hemorrhage was 10 4 hours and 10 7 hours respectively Breaking this down further, table 2 shows that the length of labor has no definite relationship to retinal hemorrhage

METHOD OF DELIVERY, POSITION OF FETUS AND TYPE OF MATERNAL PELVIS IN RELATION TO INCIDENCE OF RETINAL HEMORRHAGE

An analysis of the method of delivery, the birth position of the fetus and the type of maternal pelvis indicates that there is no significant relationship between these factors and the incidence of retinal hemorrhages This holds true whether vitamin K was administered or withheld In both groups the incidence of retinal hemorrhage is slightly greater in difficult deliveries than in normal ones The difference, however, is of no statistical significance

SEX AND BABY WEIGHT IN RELATION TO RETINAL HEMORRHAGE

No evidence is present that retinal hemorrhage is correlated to the sex of the baby The average weight of the newborn was 3,378 Gm in the group displaying

9 Kato Katsuji Microprothrombin Test with Capillary Whole Blood Modification of Quick's Quantitative Method Am J Clin Path 10 147 (Feb) 1940

10 5 4 amino-2 methyl 1 naphthol

retinal hemorrhages and 3,295 Gm in the group without retinal hemorrhages No evidence of any vitamin K influence is noted in these groups

### EFFECT OF VITAMIN K ON TOTAL INCIDENCE OF RETINAL HEMORRHAGE

The results of our series of 432 cases are expressed in table 3 A difference of 1 3 per cent in the incidence of retinal hemorrhage in the two groups can hardly be called significant as to the effectiveness of vitamin K

### RELATION OF PROTHROMBIN TIME AND RETINAL HEMORRHAGES

Prothrombin time was determined in 83 infants of this series Although the group was relatively small, we believe that certain facts stand out sufficiently to warrant their presentation

In this series of 83 cases the average infant prothrombin time, seventy-two hours after birth, was 82 5 per cent, while at nine days post partum it had risen to 93 3 per cent The instances in which the mother received no vitamin K averaged 77 6 per cent and 93 0 per cent for the seventy-two hour and nine day interval respectively The instances in which the mother received vitamin K showed the infant prothrombin time averaging 87 3 per cent and 93 6 per cent at seventy-two hours and nine days respectively Thus there was a significant elevation (about 10 per cent) in the seventy-two hour prothrombin level in infants whose mothers received vitamin K By the ninth postpartum day the prothrombin time levels off, except in cases in which severe hypoprothrombinemia exists

In the group of 83 mothers, 50 received no vitamin K As shown by table 4, the difference of the average prothrombin time of these infants, whether retinal hemorrhage was present or not, is only 2 per cent

Thirty-three patients in this group received vitamin K The results are presented in table 5 The difference in the average prothrombin time in the infants with and without retinal hemorrhage is merely 3 per cent

This difference of 2 per cent and 3 per cent in the two groups is well within the limits of error as far as prothrombin time determinations are concerned

### COMMENT

It is to be emphasized that the observations made in this paper have been solely devoted to hemorrhages seen at birth or within the first forty-eight hours thereafter If all bleeding seen in the newborn constitutes hemorrhagic disease of the newborn (as has been intimated by much of the literature), then one must specify these hemorrhages as the "early type" in contradistinction to the "delayed type." In following the retinal hemorrhages from day to day it was significantly noted that their absorption occurred very rapidly, leaving little or no trace In fact, it was necessary to observe the majority of the fundi within the first twenty-four hours in order to be accurate regarding the true incidence of retinal hemorrhages This is important, as one would actually anticipate a persistence and possible increase in the number of retinal hemorrhages after forty-eight hours if hypoprothrombinemia were the sole etiologic factor, this in the light of repeatedly observed decrease in the prothrombin level of the infant's blood during the second third and fourth days of life [3]

In discussing the etiology of hemorrhage, one must recall that there may be an alteration of the integrity of the vascular endothelium Hypoprothrombinemia cannot be conceived as effecting an endothelial change Actual trauma and anoxia seem to be the more important factors in the production of hemorrhages in the retina of the newborn. The opportunities for anoxia and trauma in the passage through the birth canal are myriad and well accepted Since the great majority of infants have essentially normal prothrombin levels at birth, it would not seem that the hypoprothrombinemia is of much importance in the etiology of retinal hemorrhages The determination of infant prothrombin content has been reported in values below those found in the maternal blood yet well above the danger levels Most infants have rapid coagulation times which have no correlation to their prothrombin levels

This study offers support to the fact that vitamin K administration raises the prothrombin level in the newborn during the physiologic decline of the prothrombin content and may play a role in prevention of certain hemorrhages Issue is, however, taken with the reported findings that antepartum vitamin K administration materially reduces the incidence of retinal and other tissue hemorrhages We agree with Sanford, Schmigelsky and Chapin [8] that vitamin K given ante partum does not reduce the incidence of retinal hemorrhages in the newborn

### CONCLUSIONS

1 Vitamin K administered either ante partum or intra partum does not reduce the incidence of retinal hemorrhages in the newborn

2 Vitamin K thus administered raises the infant prothrombin time during the physiologic decline

## RELATION OF TOBACCO SMOKING TO ARTERIOSCLEROSIS OBLITERANS IN DIABETES MELLITUS

LEONARD A. WEINROTH M D
and
JOSEPH HERZSTEIN, M D
New York

Our purpose in this study was to determine the relative incidence of occlusive arterial disease in diabetic patients who smoked tobacco as compared with similar patients who abstained from its use Any factor, like tobacco, which may affect the circulation is of especial importance to the diabetic As we have recently reemphasized,[1] the incidence of peripheral vascular disease in diabetes mellitus is high On this account the diabetic patient is often incapacitated by intermittent claudication, ulcers, gangrene and amputations As Joslin [2] says, "An elucidation of the relative importance of the various factors contributing to its [occlusive vascular disease] causation, together with improvements in our methods of preventing and of treating these complications when they arise, represent perhaps the most urgent need in diabetic treatment today"

### SCOPE OF THE WORK

The clinical material available for our study comprised 301 male diabetic patients chosen at random in the diabetic clinic A few were in the wards or the

From the Peripheral Vascular Disease Clinic and the Metabolism Clinic, Mount Sinai Hospital

Dr Samuel Silbert, chief of the Peripheral Vascular Disease Clinic of the Mount Sinai Hospital offered helpful criticism Dr Franklin Hollander assisted with the statistical evaluation of the observations

1 Herzstein, J , and Weinroth L. A Arteriosclerotic Peripheral Vascular Disease in Diabetes Arch Int. Med 76 34 38 (July) 1945

2 Joslin E P Root, H F White Priscilla and Marble Alexander Treatment of Diabetes Mellitus, Philadelphia Lea & Febiger 1940 p 419

Mount Sinai Hospital The ages ranged from 16 to 88 years The investigation was limited to males, because few of our female patients were smokers

The patients were questioned about their smoking habits in order to fit them into classifications of nonsmoker and light, moderate or heavy smoker

TABLE 1—*Arteriosclerosis Obliterans in Relation to Smoking*

Symptoms referable to the lower extremities were carefully investigated in order to evaluate those due to intermittent claudication in contradistinction to those of orthopedic, arthritic or neuritic origin The lower extremities were examined by palpation of the arteries The dorsalis pedis, anterior and posterior tibial, popliteal and femoral arteries were palpated In approximately two thirds of the patients oscillometric studies were made

When there was no intermittent claudication and the vessels in both extremities were open, the patient was considered as not having arteriosclerosis obliterans Also, if the dorsalis pedis pulse alone could not be felt, no abnormality was diagnosed This pulse is not palpable in about 5 per cent of normal persons When there was no pulsation in one or several of the other arteries the patient was considered to have occlusive vascular disease Ruling out thromboangiitis obliterans and embolism, we assumed that when thrombosis was present it was on an arteriosclerotic basis We divided our patients into two groups, namely those with or those without arteriosclerosis obliterans

This method of appraisal is not presumed to reveal the exact condition of the arteries Patients may have x-ray evidence of arterial calcification and yet have no symptoms because of sufficient patency of their vessels Again, some arteries may become thrombosed in the presence of minimal clinical evidence of arteriosclerosis while others remain open in spite of extensive pathologic change

TABLE 2—*Arteriosclerosis Obliterans in Various Age Groups*

INCIDENCE OF PERIPHERAL VASCULAR DISEASE

*In Relation to Age*—Among the entire group of 301 patients there were 83 smokers and 218 nonsmokers The average age for the two groups was similar As shown in table 1, 37 3 per cent of the nonsmokers had arteriosclerosis obliterans as against 57 8 per cent of the smokers, a difference of 20 5 per cent favoring the nonsmokers

When the factors of smoking and vascular closure are tabulated according to ascending age groups (table 2) they show, as one might anticipate, an increasing incidence in successive decades Among the older patients more arteriosclerotic vascular disease was expected and found In the group of patients aged 70 or more the same incidence of disease occurred, about 70 per cent in each group However, in the decades before this it will be noted that there were fewer patients with thrombosed vessels among the nonsmokers In the decade 50-59 years, which presented a fairly large group of patients, the number with thrombosed vessels was approximately half as great in the nonsmokers as compared with the smokers

Because of the relatively small number of nonsmokers in the younger age groups we have condensed table 2 into two large groups, eliminating the age group of 70 and over The data appear in table 3 As in table 1, the figures indicate a smaller proportion of patients

TABLE 3—*Arteriosclerosis Obliterans by Age Groups*

(Condensation of Table 2)

| | | Nonsmokers | | Smokers | |
|---|---|---|---|---|---|
| Age Group | Total in Age Group | No in Group | Condition Present | No in Group | Condition Present |
| Up to 49 years | 68 | 15 | 1 ( 6 7%) | 53 | 20 (37 7%)* |
| 50 to 59 | 177 | 51 | 18 (3o 3%) | 126 | 79 (62.7%)† |
| Total | 245 | 66 | 19 (28.8%) | 179 | 99 (oo.3%) |

* Chi square = o 29 n = 1 P = 2.2%
† Chi square = 11 01 n = 1 P = 0 09%

TABLE 4—*Arteriosclerosis Obliterans in Relation to Amount of Smoking* *

| | Total Number of Patients | Condition Present |
|---|---|---|
| Nonsmokers | 74 | 26 (3o 1%) |
| *Light smokers.* | 37 | 20 (o5 0%) |
| Moderate smokers | 82 | 45 (54.9%) |
| Heavy smokers | 9> | 56 (o8.9%) |

* In this and in subsequent tables the total number of patients in each group is less than in the preceding tables owing to the incompleteness of all the records in some of the factors other than the presence of arteriosclerosis obliterans The actual percentage incidence of this condition in the smoker and nonsmoker groups remains practically unaltered

with thrombosed vessels among nonsmokers Tables 1 and 3 have been submitted to careful analysis to determine their statistical significance The calculations indicate that the correlations are significant and are not due to chance sampling The probability figures supplied by Dr Franklin Hollander of the Gastroenterology Research Laboratory of the Mount Sinai Hospital appear in tables 1 and 3

*In Relation to Grade of Smoking*—A patient who smoked up to 5 cigarets a day was considered a light smoker Those who smoked from 5 to 15 cigarets a day were placed in the group of moderate smokers The heavy smokers were those who smoked more than 15 cigarets each day When the patient smoked cigars or a pipe the amount of tobacco used was a gage in the classification An analysis of the possible effects of degree of smoking as revealed in table 4 did not show any significant difference between heavy smokers and light or moderate smokers It is possible that real differences might be lost because of the difficulty of making truly quantitative subdivisions of grade of smoking

As shown in table 5, among the smokers from whom the information was obtained there is a possible suggestion that a prolonged period of smoking may be associated with increased vascular disease

*In Relation to Duration of Diabetes*—It is to be expected that patients who have diabetes for a long time will be more likely to have peripheral arterial disease some metabolic factor operating here presumably to induce it Should smoking aggravate the condition, then people with diabetes even of short duration might experience more involvement if they smoked That this is the case is suggested in table 6 In the nonsmokers arteriosclerosis obliterans tends to be slightly less frequent than in the group of smokers There were 105 patients with diabetes up to five years in duration For the group as a whole the incidence of arteriosclerosis obliterans was 44 per cent For the nonsmokers in the group the incidence was less, namely 23 per cent Among the smokers the incidence was much higher, namely 53 per cent

TABLE 5—*Arteriosclerosis Obliterans and Years of Smoking*

| Number of Years | Number of Patients | Condition Present |
|---|---|---|
| Under 5 years | 2 | 0 |
| 6-10 | 11 | 3 |
| 11 19 | 9 | 2 |
| 20-29 | 24 | 14 |
| 30 or more | 113 | 6 |

TABLE 6—*Arteriosclerosis Obliterans in Relation to Duration of Diabetes and Smoking*

| | Nonsmokers | | Smokers | |
|---|---|---|---|---|
| Years Duration | Total Number of Patients | Condition Present | Total Number of Patients | Condition Present |
| Under 3 years | 22 | 4 (18.2%) | 60 | 31 (51 7%) |
| 4 to 5.. | 8 | 3 (37.5%) | 15 | 8 (53.3%) |
| 6 to 10 | 24 | 11 (45.8%) | 57 | 31 (54 4%) |
| 11 or more | 19 | 7 (36.8%) | 79 | 48 (60.8%) |

*In Relation to Severity of Diabetes*—Depending on such factors as blood sugar levels and insulin requirements, the patients were classified according to the severity of their illness as having mild, moderately severe and severe diabetes In table 7 it is seen that in each grade of severity of diabetes the percentage involvement with arteriosclerosis obliterans is less among the nonsmokers We had more patients with mild and moderately severe diabetes than with severe diabetes When the first two types are grouped together, 36 per cent of the nonsmokers had occluded vessels as against 60 per cent for the smokers

*In Relation to Degree of Diabetic Control*—From the figures in table 8 which show the relation between arteriosclerosis, adequacy of control and smoking, it appears that there is a penalty for smoking Among 41 well controlled diabetic patients who did not use tobacco 13, or 31 8 per cent, had occluded vessels Among 117 similarly well controlled patients who were smokers 67, or 57 3 per cent, were affected by the condition The patients whose diabetes was only under fair control had about the same incidence of arteriosclerosis obliterans whether they smoked or not However, a difference did exist in the group of poorly controlled patients Here the nonsmokers had less arteriosclerosis obliterans than the smokers Five out of 19 poorly controlled nonsmokers, or 26 3 per cent, had occluded vessels In a corresponding group of 40 poorly controlled patients who smoked 20, or 50 per cent, had closed peripheral arteries

TABLE 7—*Severity of Diabetes and Arteriosclerosis Obliterans and Smoking*

| | Nonsmokers | | Smokers | |
|---|---|---|---|---|
| Severity of Disease | Total Number of Patients | Condition Present | Total Number of Patients | Condition Present |
| Mild | 43 | 15 (34.9%) | 109 | 67 (61.5%) |
| Moderately severe | 19 | 7 (36 8%) | 6. | 37 (58 7%) |
| Severe. | 10 | 2 (20 0%) | 36 | 12 (33.3%) |

TABLE 8—*Control of Diabetes, Arteriosclerosis Obliterans and Smoking*

| | Nonsmokers | | Smokers | |
|---|---|---|---|---|
| | Total Number of Patients | Condition Present | Total Number of Patients | Condition Present |
| Good | 41 | 13 (31.8%) | 117 | 67 (57.3%) |
| Fair | 12 | 6 (50 0%) | 51 | 28 (55 0%) |
| Poor | 19 | 5 (26 3%) | 40 | 20 (50 0%) |

*In Relation to Obesity*—The factor of obesity in our patients was gaged by an appraisal of their past and present weights The thin men and those who did not weigh more than 150 pounds (68 Kg ) were considered nonobese On the basis of obesity alone we found peripheral vascular disease as frequently in the nonobese as in the obese The figures for the added factor of tobacco smoking appear in table 9 Among nonobese diabetic patients alone, those who did not smoke experienced less arteriosclerosis obliterans than those who did The percentage incidence for the thin or normal weight nonsmokers was 35 7 as against 53 2 for smokers of similar build In our series of patients there were 176 men who were obese at one time or another Taking this group as a whole, 52 per cent had arteriosclerosis obliterans When these obese patients are considered in the light of their smoking habits, less arteriosclerosis obliterans was found in those who abstained from the use of tobacco Out of 44 obese nonsmokers 14 or

TABLE 9—*Obesity and Arteriosclerosis Obliterans and Smoking*

| Never obese. | 23 | 10 (3. 7%) | 77 | 41 (53.2%) |
| Obese at time of examination or previously | 44 | 14 (31 8%) | 132 | 77 (58.3%) |

TABLE 10—*Hypertension and Arteriosclerosis Obliterans and Smoking*

| | Nonsmokers | | Smokers | |
|---|---|---|---|---|
| Group | Total Number of Patients | Condition Present | Total Number of Patients | Condition Present |
| No hypertension | 37 | 10 (27 0%) | 112 | 65 (. to 1%) |
| Hypertension present | 33 | 14 (42.4%) | 93 | 60 (64.5%) |

31 8 per cent had occluded vessels, which is less than the figure of 52 per cent for the obese group as a whole Among 132 obese patients who did use tobacco 77, or 58 3 per cent, had occluded vessels, a figure which is 26 5 per cent higher than that for the nonsmokers of similar constitution

*In Relation to Hypertension*—We used a systolic tension of 150 mm and a diastolic of 90 mm to separate the hypertensive from the nonhypertensive patients On the basis of arterial tension alone the hypertensive patients had a somewhat higher incidence of arteriosclerosis obliterans For the patients without hypertension the incidence was 44 per cent as against 58 7 per cent among the patients with hypertension Adding the factor of smoking (table 10), the figures become altered in a direction favoring the nonsmokers in each group Among 37 patients without hypertension who abstained from the use of tobacco 10, or 27 per cent, had occluded vessels Among 112 patients with similar arterial tension but who did use tobacco there were 55, or 49 1 per cent, who had closed vessels Turning to the hypertensive patients a similar condition favoring the nonsmokers was found to exist Nonsmokers in the hypertensive group had an incidence of 42 4 per cent of arteriosclerosis obliterans, while smokers in the hypertensive group experienced a percentage of 64 5 for the condition

## COMMENT

Our findings indicate a significantly higher incidence of occlusive vascular disease in diabetic patients who smoked tobacco as compared with diabetic nonsmokers This held true in all decades up to 70 years

In searching through the literature we find a paucity of references on the possible relationship between smoking and the incidence of thrombosis of the peripheral arteries Whereas it is generally admitted that smoking because of its vasoconstrictor effect is harmful to patients who already have arteriosclerotic peripheral vascular disease, tobacco is not believed to be a contributing factor in its causation

Several workers have reported such a link on the basis of animal experiments, but, as Thienes and Butt [3] point out, most of the tests were inadequately controlled In this connection Thienes and Butt [3] suggest that the acute peripheral vasoconstriction associated with tobacco smoking might exaggerate the effects of existing vascular disease Blotner [4] reported a fatal case of diabetic gangrene in a man aged 34 who smoked 60 cigarets a day and thought that the patient's excessive smoking might possibly have precipitated the gangrene which ensued

Recent work done mostly on healthy persons shows almost uniformly that tobacco smoke produces vasoconstriction, elevation of the blood pressure and an increase in pulse rate Graybiel, Starr and White,[5] among others, noted the lowering and inversion of T waves in the electrocardiogram during smoking tests

Ralli and Oppenheimer [6] presented evidence of peripheral vasoconstriction during smoking with a rise in blood pressure and onset of precordial pain in patients with "tobacco angina" Hines and Roth [7] found that a rise in blood pressure occurred in the majority of persons given a standard smoking test Excessive rises were noted in individuals with hyperactive vascular systems as measured by cold pressor tests Short and Johnson [8] compared the reactions to tobacco smoke with those induced by epinephrine and found the reactions parallel, both causing a rise in pulse rate, blood pressure and blood sugar Curiously enough this slight rise in blood sugar was thought by Haggard and Greenberg [9] to be the source of the smoker's gratification In animals injected with nicotine they noted a rise in blood sugar and respiratory quotient when these values were low

The peripheral vasoconstricting action of tobacco smoking in man has been repeatedly demonstrated Simici and Marcu [10] presented plethysmographic data showing the vasoconstrictor action of tobacco smoke. Wright and Moffat [11] found that after smoking there occurred a decided drop in surface temperature of the tips of the fingers and toes They also noted a frequent slowing and stoppage of the blood flow in capillaries of the nail fold The length of time the subject had been a smoker and number of cigarets habitually smoked daily had no determinable effect on the degree of temperature drop Moyer and Maddock [12] also induced skin temperature fall after smoking, with no significant difference in response between light and heavy smokers Johnson and Short,[13] Maddock and Coller,[14] Weatherby [15] and Roth, McDonald and Sheard [16] were able to demonstrate a drop in skin temperature consequent to tobacco smoking

We have been unable to find any statistical reports with which we could compare our observations There are however several contributions which relate smoking and age groups to coronary artery disease White and Sharber [17] found no statistical relationship between tobacco smoking and angina pectoris They did believe, however, that in occasional instances the use of tobacco might precipitate an attack

Glendy Levine and White [18] stated that among 88 patients below 40 years of age suffering from coronary artery disease 93 per cent were smokers English Willius and Berkson [19] found that in age groups 40-49 and 50-59 there was a significantly greater incidence of coronary artery disease among smokers as compared to similar nonsmoking controls Beyond 60 years of age no noteworthy difference was observed Willius [20]

remarks elsewhere that tobacco has its greatest damaging possibilities in the younger age groups Interestingly enough Pearl [21] in his investigation of smoking on longevity came to the conclusion that up to the age of 70 nonsmokers outlive smokers Beyond this age smoking tobacco had no influence on longevity

The mechanism of the increased frequency of occlusive arterial disease which we have noted in diabetic smokers is not clear It is conceivable that over a period of time by virtue of its vasoconstrictor effect an already constricted arteriosclerotic vessel may become still further narrowed Such encroachment on the lumen would favor thrombus formation It is also conceivable that functional constriction of an artery may increase the tendency to rupture of an atheromatous plaque or to a hemorrhage into it with subsequent thrombosis

SUMMARY

In a group of 301 male diabetic patients a significantly higher incidence of thrombosed peripheral arteries was found in smokers as compared with abstainers from tobacco

This condition existed among those who had diabetes for less than five years as well as in those with diabetes of longer duration Regardless of such factors as severity of the illness, adequacy of control, presence of obesity or hypertension, a lower frequency of arteriosclerosis obliterans prevailed in general among nonsmokers

## RHEUMATIC FEVER IN NAVAL ENLISTED PERSONNEL

### III The Physiologic and Toxic Effects of Intensive Salicylate Therapy in Acute Cases

COMMANDER R. C. MANCHESTER (MC), U S N R

Acute rheumatic fever in young adults, either in naval service [1] or in civilian life,[2] begins primarily as an acute infection exhibiting acute polyarticular arthritis as the major manifestation Intensive salicylate therapy, when instituted early in the acute phase,[3] following the principles outlined by Coburn,[4] successfully suppresses infection in such cases [5] The incidence of polycylic recrudescences and residual chronic infection is materially reduced Cardiac residua are prevented if therapy is instituted before significant clinically recognizable carditis has appeared and already existing carditis is favorably influenced

In applying Coburn's therapeutic regimens to young men, 10 Gm or more of salicylates, given intravenously or orally, is usually required Even smaller doses are known to depress plasma prothrombin, induce alterations in acid base equilibrium and precipitate serious toxic reactions Therefore the safe yet effective application of the method hinges on the dosages required, the physiologic and toxic effects of such dosages, the incidence of serious toxic reactions and means for their avoidance An analysis of these factors is presented in this paper

#### PLAN OF STUDY AND METHODS

The group for study comprised 54 young men who were afflicted with acute rheumatic fever Each patient exhibited a temperature of 100 F or over and acute articular and/or visceral manifestations when therapy was instituted Thirty-five patients received 10 Gm of sodium salicylate in a liter of saline solution or Ringer's lactate solution intravenously daily for four to ten days, followed by oral therapy Nineteen additional patients received oral therapy throughout the course of treatment Intravenous medication was begun at 9 a m and completed at 3 p m , requiring six hours for administration Oral medication consisted of between 10 and 12 Gm of acetylsalicylic acid or sodium salicylate daily, usually in conjunction with 8 Gm of sodium bicarbonate and was given in equally divided doses each four hours

Blood salicylates were determined on serum by the method of Brodie, Undenfriend and Coburn [6] Quick's method [7] was employed for prothrombin clotting time Values are expressed in percentages of normal control bloods analyzed at the same time Plasma carbon dioxide combining power was used as an index of alterations in acid base balance and was determined by Van Slyke's gasometric method [8]

#### OBSERVATIONS FROM LITERATURE AND RESULTS OF STUDY

1 *Blood Salicylate Values on Different Regimens*—Coburn [4] observed that minimum plasma salicylate levels of 35 mg per hundred cubic centimeters were required to suppress rheumatic infection in young adults suffering from acute attacks Ten gram quantities of sodium salicylate orally daily in equally divided dosages each four hours produced mean levels of 35 6 mg per hundred cubic centimeters ordinarily attained within forty-eight hours after treatment was instituted Ten Gm intravenously produced higher values during and immediately after actual administration, but levels frequently fell below 35 mg per hundred cubic centimeters in the interval before the next injection Smull, Wegria and Leland [9] found that sodium bicarbonate given in conjunction with salicylates orally produced lower blood levels than when salicylates were given alone The observations of Coombs [10] indicate that this depressing effect is due to increased urinary excretion

Serum salicylate levels obtained on intravenous and different oral regimens were studied In table 1 are represented the values found at 8 30 a m , immediately before, and at 3 30 p m , thirty minutes after, the six hour period of actual intravenous administration A relatively stable morning pretreatment level, averaging between 25 and 28 mg per hundred cubic centimeters, was attained after the second injection During

actual administration values rose rapidly and readings taken thirty minutes afterward, at 3 30 p m, averaged between 35 and 46 mg per hundred cubic centimeters Rather wide variations were observed between different individuals receiving the same dosage, but only minor fluctuations occurred in the same individuals from day to day In spite of the fact that serum salicylate values exceeded Coburn's suggested minimum of 35 mg per hundred cubic centimeters for only a fraction of each twenty-four hour period, dramatic therapeutic results were obtained in all 35 cases except 1, in which 20 Gm doses were required on the second and third days for suppression of the acute manifestations

Salicylate values obtained under different conditions of oral therapy are presented in table 2 Acetylsalicylic acid and sodium salicylate were equally effective Daily doses of 12 Gm in conjunction with 8 Gm of sodium bicarbonate produced average levels of 38 and 37 mg per hundred cubic centimeters respectively Ten Gm of acetylsalicylic acid in conjunction with 8 Gm of sodium bicarbonate gave somewhat lower levels, averaging 32 mg per hundred cubic centimeters In agreement with Smull, Wegria and Leland [9] sodium bicarbonate was found to have a depressing action, and higher serum levels averaging 44 mg per hundred cubic centimeters were attained when it was omitted As with intravenous therapy, salicylate levels varied rather widely between different individuals on the same dosage but showed only minor fluctuations from week to week in the same individual

Serum salicylate levels built up rapidly on oral therapy, as shown in table 3, and reached average maximum values within forty-eight hours after starting medication The average produced by 10 Gm of acetylsalicylic acid daily was 21 mg per hundred cubic centimeters in twenty-four hours and 31 mg per hundred cubic centimeters in forty-eight hours Thus, within forty-eight hours salicylate levels secured with oral therapy exceeded those from intravenous medication except during and immediately after the actual period of administration of the latter Nevertheless, intravenous therapy was more effective than oral in alleviating acute manifestations Except for this difference, oral salicylates in between 10 and 12 Gm quantities daily satisfactorily suppressed rheumatic infection [3] Serum salicylate levels of 25 mg per hundred cubic centimeters or higher appeared to be as effective as Coburn's suggested minimum of 35 mg per hundred cubic centimeters

2 *Acid Base Balance*.—Alterations in acid base equilibrium in subjects receiving large doses of salicylates have been attributed to a fixed acid acidosis [11] or to hyperventilation due to central respiratory stimulation.[12] An increase in blood $p_H$ and lowering of carbon dioxide tension have been amply demonstrated in cases exhibiting hyperventilation In addition, Fashena and Walker [13] found that five of six experimental subjects studied showed a small but significant fall in plasma carbon dioxide combining power averaging roughly 12 volumes per cent, equivalent to a 20 per cent decrease in the alkali reserve Since the fall was not accompanied by any respiratory or urinary changes,

they believed that it could be accounted for only on the basis of the accumulation of fixed acids Therefore it would appear that both the accumulation of fixed acids and hyperventilation may contribute to any alterations observed

The effect of different regimens on acid base equilibrium has been studied by observations on plasma carbon dioxide combining power As recorded in table 4, when intravenous salicylates were administered in a liter of isotonic solution of sodium chloride the plasma carbon dioxide combining power fell in six days to an average of 45 volumes per cent One patient failed to show any significant change The other 5 each

plasma carbon dioxide combining power of 35 patients significantly Twelve Gm in conjunction with 8 Gm of sodium bicarbonate caused a sharp decrease to 39, 41 and 43 volumes per cent in 3 of 35 patients Four patients received 12 Gm of acetylsalicylic acid daily without sodium bicarbonate Table 5 shows the rapid serious depletion of alkali reserve which occurred when alkali was omitted The plasma carbon dioxide combining power in each instance fell to between 27 and 41 volumes per cent

No measurements have been made concerning the relative role played by hyperventilation and the accumulation of fixed acids Urinary ketone bodies did not appear in any of the subjects Although mild hyperventilation was sometimes observed earlier severe grades of hyperpnea did not occur until a significant depletion of alkali reserve already existed Whatever the cause may be, the salient fact is that depletion of the alkali reserve can be eliminated by giving adequate quantities of alkali in conjunction with salicylates Therefore Ringer's lactate solution should be used as a diluent for intravenous salicylates, and a minimum of not less than 0 8 Gm of sodium bicarbonate should be given with each gram of salicylates orally

salicylic acid, Link and his co-workers [14] demonstrated that salicylic acid produced hypoprothrombinemia in rats on a low vitamin K ration which was preventable by the addition of vitamin K Recent studies have shown that similar effects occur in human beings even in the absence of vitamin K deficiency [15] Fashena and Walker [15] observed that moderate as well as large doses of sodium salicylate produce hypoprothrombinemia beginning within twenty-four hours and reaching a peak on the second day but tending thereafter to improve spontaneously in spite of continued salicylate therapy Butt and his co-workers [16] found that the prothrombin lowering effect was not enhanced by increasing salicylate dosage from 10 Gm to a total of 12 Gm daily Shapiro [17] estimated that 1 mg of synthetic vitamin K counteracted the prothrombin reducing effect of 1 Gm of acetylsalicylic acid

Ten patients tested received intravenous salicylates for one week followed by oral therapy Ten others received oral therapy throughout the study The effect of intravenous salicylates on blood prothrombin is shown in table 6 The data presented in table 7 combine the intravenous and oral groups Both oral and intravenous salicylates frequently caused a prompt decline in blood prothrombin in the first week as reflected by an increase in prothrombin clotting time to a maximum of 51 per cent of normal Spontaneous improvement occurred thereafter even though 10 and 12 Gm daily quantities of salicylates were continued orally for as long as ten

weeks Since prothrombin must be reduced to one fifth of normal before hemorrhage occurs [18] an adequate margin of safety existed Furthermore, no hemorrhagic tendencies attributable to hypoprothrombinemia have occurred in over 160 patients who have received intensive salicylate therapy in this hospital Other observers have found that the fall is not great [19] Therefore, although salicylates may induce a moderate degree of hypoprothrombinemia a dangerous depletion sufficient to induce hemorrhage is unlikely

4 *Toxic Effects of Salicylates*.—Mild toxic reactions such as nausea, transient vomiting, deafness, tinnitus, vertigo and sweating are of no significance and need not be considered Serious reactions which interrupted

treatment schedules consisted of delirium, dyspnea, excessive vomiting, renal pain and skin eruptions These are presented in table 8

Delirium, usually referred to as acute salicylism, was the most serious reaction encountered and was observed in 17 per cent of the 35 cases in which intravenous therapy was administered It occurred on the second day in 2 cases, third day in 1, fourth day in 2 and fifth day in 1 A prodromal period of mental confusion lasting a few hours was followed abruptly by visual hallucinations of insects and animals, delusions of persecution, sleeplessness, varying degres of hyperpnea, purposeless movements and extreme mental and motor overactivity Symptoms subsided in each instance within forty-eight hours after salicylates were stopped One patient died of acute carditis with failure twenty-four hours after all traces of delirium had disappeared The others tolerated subsequent salicylates orally in 10 and 12 Gm daily quantities even though oral medication was instituted in each instance after only twenty-four hours of complete freedom from delirium Intravenous salicylates repeated later failed to precipitate further mental reactions Furthermore, among over 160 patients receiving intensive salicylate therapy no mental reactions were observed in any patient while on oral therapy or among those in whom intravenous therapy was instituted after the acute phase of their illness had subsided Therefore this serious reaction can be attributed to the

TABLE 8.—*Significant Toxic Reactions Observed in Patients Receiving Intensive Oral and Intravenous Salicylate Therapy*

| Toxic Reactions | Intravenous Salicylates | Oral Salicylates |
|---|---|---|
| Delirium acute salicylism | 17% | 0 |
| Accentuation of dyspnea of cardiac failure. | 6% | 3% |
| Severe dyspnea | 3% | 14% |
| Excessive vomiting | 3% | 0 |
| Renal pain | 3% | 0 |
| Skin eruption | 3% | 0 |

abrupt, rapid rise in blood salicylate levels associated with intravenous therapy and is most likely to occur in acutely ill patients who have not built up an antecedent tolerance to the drug

A mild acceleration of respiration attributed to direct stimulation of the respiratory center was frequently observed during intravenous therapy and less often with oral salicylates This acceleration in conjunction with already existing dyspnea of cardiac failure was sufficient in 3 cases to preclude temporarily further intravenous or oral salicylates It was avoided by using aminopyrine in 4 to 6 Gm quantities daily instead of salicylates until cardiac failure was alleviated

Severe dyspnea unrelated to cardiac failure or delirium was characterized by hyperpnea even on slight physical exertion A peculiar feature was the lack of sufficient breath to carry on meager conversation even when respirations were subdued during complete bed rest This suggested the type of difficulty experienced by apneic subjects following periods of hyperventilation Dyspnea of this character occurred in 1 patient who inadvertently received intravenous salicylates in distilled water instead of saline or Ringer's lactate solution and in 14 per cent of those on oral therapy Three of the latter (patients B, C and D, table 4) were receiving acetylsalicylic acid and one enteric coated sodium salicylate daily in 12 Gm quantities without additional sodium bicarbonate, and the other 3 the same dosage of acetyl salicylic acid in conjunction with 8 Gm of sodium bicarbonate Dyspnea in each instance was associated with a decreased plasma carbon dioxide combining power to between 27 and 43 volumes per cent Significant decreases in plasma carbon dioxide combining power did not occur in those on 10 Gm quantities of acetylsalicylic acid daily in conjunction with 8 Gm of sodium bicarbonate, and no instances of excessive dyspnea were observed in this group Therefore, this reaction is related to depletion of the alkali reserve and is preventable by giving adequate amounts of alkali in conjunction with salicylates It can be estimated that between 0 8 and 1 Gm of sodium bicarbonate for each gram of salicylates should be sufficient

The other reactions observed were of little significance and cleared up promptly after intravenous salicylates were stopped Subsequent oral therapy was well tolerated in each instance Leukocytes were frequently observed in the urine in oral and intravenous therapy, but no evidence of permanent renal damage was observed

## COMMENT

The clinical observations and data presented clearly indicate that the dosages required in applying Coburn's intensive salicylate regimen to young adults with acute rheumatic fever may induce physiologic and toxic reactions of serious proportions but that these reactions are preventable in most instances

Hypoprothrombinemia occurs frequently, reaching a maximum in the first week of salicylate administration but improving spontaneously thereafter even though large dosages are continued The effect is not great and this study, as well as the observations of others, indicates that blood prothrombin is not dangerously reduced Instances have been recorded in the literature of hemorrhages attributed to salicylate induced hypoprothrombinemia,[20] but a proved case has yet to be reported

Alkali reserve, as measured by plasma carbon dioxide combining power, is depleted unless adequate amounts of alkali are given in conjunction with salicylates In this study 0 8 Gm of sodium bicarbonate per gram of acetylsalicylic acid was adequate when 10 Gm of acetylsalicylic acid was administered orally daily, 0 66 Gm of sodium bicarbonate per gram of acetylsalicylic acid was not sufficient to prevent a significant fall in plasma carbon dioxide combining power when 12 Gm quantities were given Consequently it may be assumed that, when large dosages of salicylates are contemplated orally, between 0 8 and 1 Gm of sodium bicarbonate should be given with each gram of salicylate For the same reason intravenous salicylates should be administered in Ringer's lactate instead of saline solution Under no circumstances should alkali be omitted for the purpose of securing higher blood salicylate levels If these precautions are observed, significant alterations in acid base equilibrium will not occur and excessive dyspnea will be avoided

Severe delirium, "acute salicylism," is dependent on the abrupt rapid rise in blood salicylate levels associated with intravenous therapy and is most likely to occur in acutely ill patients who have not built up an antecedent tolerance to the drug It has not been observed in this series under conditions of oral therapy, although reports of such reactions after large quantities by mouth have appeared in the literature Since intravenous therapy is desirable in the more acute cases, it is not preventable in all instances Such patients must be

20 Ashworth C T and McKemie, J F Hemorrhagic Complications with Death Probably from Salicylate Therapy J A M A 126 806-810 (Nov 25) 1944

carefully observed for prodromal mental confusion so that medication can be promptly discontinued before severe delirium is precipitated

Serum salicylate levels of 25 mg per hundred cubic centimeters or higher have been found in this study to suppress rheumatic infection satisfactorily This minimum is exceeded by a satisfactory margin in young adults by 10 to 12 Gm quantities of acetylsalicylic acid or sodium salicylate daily in conjunction with 8 Gm of sodium salicylate

Pending further investigation, the following program has been adopted for the treatment of acute rheumatic fever in young adults at this hospital More severely infected patients with temperatures of over 102 F but without cardiac failure, receive intravenous therapy of 10 Gm daily in a liter of Ringer's lactate solution for four to seven days, followed by oral therapy A period of six hours is required for each injection Patients with cardiac failure are treated with 4 to 6 Gm of ammopyrine daily until failure has subsided and then switched to oral salicylates Other patients receive oral salicylates from the beginning in quantities of 10 Gm daily in patients weighing less than 125 pounds (57 Kg ) and 12 Gm daily in those exceeding 125 pounds Eight to 10 Gm of sodium bicarbonate is given daily in conjunction with oral therapy Refractory cases are promptly shifted to intravenous medication until objective acute manifestations are completely relieved Salicylate therapy is continued until the erythrocyte sedimentation rate has remained normal for two weeks

CONCLUSIONS

1 Hypoprothrombinemia occurs in the early phases of intensive oral and intravenous salicylate therapy, but the prothrombin deficiency improves spontaneously in spite of continued salicylate administration and does not approach a critical level likely to precipitate hemorrhage

2 Alkali reserve is depleted unless adequate amounts of alkali are administered in conjunction with salicylates For this reason Ringer's lactate solution rather than saline solution must be used as a diluent for intravenous salicylates, and between 0 8 and 1 Gm of sodium bicarbonate should be given with each gram of salicylates orally

3 Severe delirium occurred in 17 per cent of acutely ill patients receiving intravenous salicylate therapy who had not built up an antecedent tolerance to the drug It is related to the rapid rise in blood salicylate levels associated with intravenous therapy and was not observed on oral regimens

4 Severe grades of dyspnea, except in association with cardiac failure or delirium, are related to depletion of alkali reserve and are preventable by administering adequate quantities of alkali in conjunction with salicylates

5 Serum salicylate values averaging 32 mg per hundred cubic centimeters are secured with 10 Gm of acetylsalicylic acid daily orally in conjunction with 8 Gm of sodium bicarbonate and 37 and 38 mg per hundred cubic centimeters respectively with 12 Gm of acetylsalicylic acid and sodium salicylate

6 A minimum blood salicylate level of 25 mg per hundred cubic centimeters is required to suppress rheumatic infection in acute cases

7 A treatment program for acute rheumatic fever in young adults has been developed which satisfactorily suppresses rheumatic infection and reduces the incidence of physiologic and toxic reactions to a minimum

and
R GAYLE SPANN M D
Clinical Assistant Surgical Service B Lankenau Hospital
Philadelphia

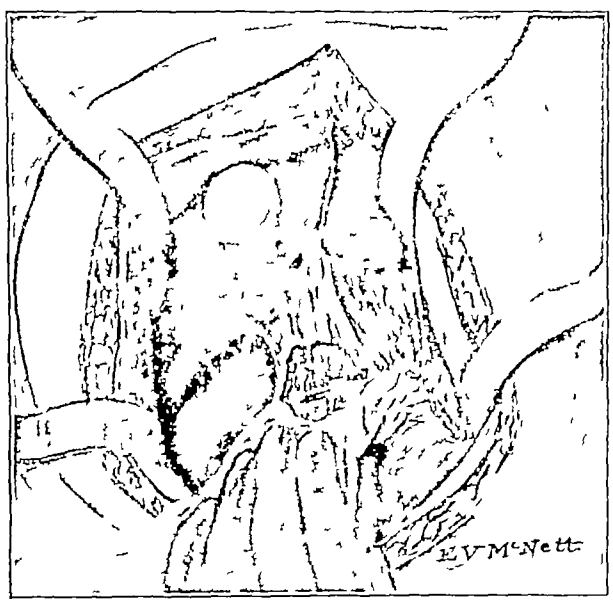
It has been repeatedly observed that jaundice is a complication of peptic ulcer in remarkably few instances when the anatomy of the region is considered Boyd [1] states that long standing ulcers frequently adhere to or perforate into the pancreas, liver or the lesser omental sac and the structure becomes indurated but he does not mention jaundice as a complication Therefore even in these cases jaundice must be encountered less often than would be expected It is probably not realized just how rarely jaundice is definitely caused by ulcer until the literature on the subject is studied

It has also been stated that a search of the literature gives a false impression of the true incidence of the occurrence of jaundice with ulcer If this is true, then more cases of ulcer with jaundice should be reported so that this false impression may be corrected. The diagnostic problems which the cases present may then be studied and the plans of treatment evaluated Otherwise each case encountered will have to be handled as a new and unheard of condition.

Parks and Fitz [2] reviewed the American literature in 1939 and found 35 cases and added 1 of their own Levine and Gordon [3] added a case in 1942, which was the first case reported in which the ulcer perforated Their patient was known to have a duodenal ulcer He became acutely ill some two weeks prior to hospital admission and then developed jaundice The ulcer perforated on the sixth day after hospitalization while x-ray and other studies were being made The perforation was repaired and the jaundice gradually disappeared They stated that they were at a loss to explain the exact mechanism of the obstruction and its apparent alleviation by perforation of the ulcer It is thought that the following case may throw some light on the probable cause of the biliary obstruction in their case and the reason for its apparent release by the perforation of the ulcer

REPORT OF CASE

Mrs G S B aged 54 white a pharmacist, was admitted to Surgical Service B at the Lankenau Hospital on Jan. 25 1944 with the chief complaint of jaundice epigastric pain and vomiting There had been episodes of indigestion and burning epigastric pain relieved by alkalis for some years One month prior to admission there had been a rather sudden accentuation of the symptoms but she was able to keep working Shortly afterward she noticed her urine becoming darker, her stools lighter in color and her skin and mucous membranes yellow Her symptoms became steadily worse until she began vomiting occasionally a week prior to admission



She was found to be rather jaundiced and dehydrated There was tenderness in the right upper quadrant and epigastrium No mass could be definitely outlined through a thick abdominal wall Peristalsis was normal Soon after admission her temperature was 101 F, pulse rate 100 and respiratory rate 22 The leukocyte count was 8 300 with a differential of neutrophils 73 per cent and lymphocytes 27 per cent icterus index 40 units van den Bergh qualitative direct, immediate quantitative 45

3 Levine Samuel and Gordon G B Complete Biliary Obstruction Complicating Duodenal Ulcer Perforation of the Ulcer Followed by Immediate Release of the Obstruction Am J Digest Dis 9: 397 398 (Nov ) 1942

mg per hundred cubic centimeters, cephalin flocculation plus 3, prothrombin time 70 per cent A survey film of the abdomen was reported as negative for opaque calculi, masses or other pertinent findings As there was evidently an acute pathologic condition in the abdomen, further x-ray studies were thought to be unwise

A diagnosis of acute calculous cholecystitis with common duct obstruction was made, though it was remarked that she had an ulcer-like history It was decided to allow the acute process to subside and prepare the patient for operation with intravenous fluids, vitamin K and vitamins parenterally and blood transfusion On the ninth hospital day the temperature and pulse were normal, abdominal signs were lessened, prothrombin time was 80 per cent and the icterus index was 37 5 units The following day she was operated on

When the peritoneum was opened, adhesions of the omentum and duodenum were bound to the undersurface of the right lobe of the liver covering the gallbladder region These were freed from the liver, exposing a tensely distended gallbladder containing no stones and not appearing infected The duodenum was seen to be adherent to the right border of the gastrohepatic omentum which was thick and indurated When the adhesions

Retraction of the duodenum freeing the perforation from the right free border of the gastrohepatic omentum overlying the common duct. This perforation had kissed against the common duct causing inflammatory reaction with obstruction of the common duct

were freed it was found that a perforation of the first portion of the duodenum had kissed against the gastrohepatic omentum and had spilled little, if any, into the general abdominal cavity, as shown in the illustration The common duct was distended but not appreciably dilated. The pancreas was only slightly more tense than normal The perforation was repaired by suturing and oversewing an omental graft A cholecystostomy was done to insure relief of the jaundice The cholecystostomy drainage gradually lessened, and lipiodol injected into the tube on the twelfth postoperative day showed a nondilated common duct and the lipiodol readily entered the duodenum Jaundice gradually subsided Convalescence was complicated only by auricular fibrillation, which was controlled with digitalization

Six weeks postoperatively the icterus index was 11 units, cephalin flocculation plus 2 A cholecystogram showed a nonfunctioning gallbladder thought to be due to the cholecystostomy Barium meal and x ray revealed only the expected deformity of the duodenum due to repair of the ulcer The patient was discharged in good condition on March 15, 1944

On July 12 the patient was seen in the follow-up clinic. She reported that she was feeling well and working daily The icterus index was 3 units and cephalin flocculation 0

She was again seen on Jan 5, 1945 She was on an ambulatory ulcer regimen and did not have indigestion, jaundice or clay colored stools She was feeling well and working every day

In view of our experience with this case, may we suggest that the case of Levine and Gordon [3] probably had the following sequence of events Two weeks before admission there was a perforation of the ulcer against the lesser omentum which temporarily sealed it off, but owing to the inflammatory reaction associated with it the common duct was obstructed by edema and pressure While this patient was in the hospital the protected perforation must have broken loose, so that there was direct spill into the peritoneal cavity He was operated on at this stage and the perforation repaired Naturally, with the contacted inflammatory process relieved from the common duct the inflammatory reaction in the duct subsided and the jaundice disappeared

The records of the Lankenau Hospital for the past fifteen years were studied and of the 376 cases of proved duodenal ulcer there was 1 case of frank jaundice in which there were common duct stones, so that this case could be eliminated as an example of jaundice from ulcer One other patient was slightly jaundiced, with an icterus index of 12 units, and no cause at operation was found other than a duodenal ulcer Bernheim [4] found in 1924 that duodenal ulcer patients averaged an icterus index of 9 units, so others no doubt would have had elevated icterus indexes had they been checked but none had clinical jaundice

Levine and Gordon [3] mention that Friedenwald [5] reviewed 1,000 cases of duodenal ulcer, Emery and Monroe [6] 556, Hinton [7] 287, Rivers [8] 191 and Laird [9] 250 cases and none mentioned jaundice as a complication Add to these the present 376 cases reviewed and the total is brought to 2,650 cases with only 1 being mentioned as exhibiting a faint clinical jaundice and an icterus index of 12 units

We suggest that in the future any patient with an ulcer history and then an acute abdominal episode followed by developing jaundice be suspected of having a protected perforation or a duodenal ulcer with obstruction of the common bile duct The most common condition to be differentiated is acute calculous cholecystitis with choledocholithiasis This differentiation should be made as quickly as possible because if the pathologic condition is a protected perforatio of an ulcer it should be repaired immediately before generalized spill occurs, whereas, if it is an acute inflammatory lesion of the gallbladder with stones in the common duct it is better to wait, if possible, until the acute inflammation subsides before the common duct is explored The Graham test is not reliable in such a case because of the decreased liver function, and the various liver function tests are of little assistance as both conditions give an obstructive type of jaundice with evidence of hepatocellular damage superimposed as it progresses

A survey film should be made of the abdomen If gallstones are demonstrable, of course, biliary disease is almost certain to be the whole picture During the study of these cases it was noted that, though on admission peptic ulcer and gallbladder cases were frequently mistaken for each other, the two conditions seldom existed concurrently If no stones are seen, the film is of no assistance Then, with the patient ready for immediate operation, one should proceed with x-ray study of the duodenum with barium and as little manipulation as possible If the duodenal deformity of ulcer is demonstrated, immediate operation should be performed If no ulcer is

demonstrated, the case should be treated as an acute inflammatory gallbladder until the optimum time for operation

Since considering the mechanism of the production of the jaundice in our case and the review of Levine and Gordon's[3] case in which the ulcer was merely repaired, we suggest that these cases be treated by repair of the ulcer with suture and oversewing of an omental graft without drainage of the biliary tract The induration around the common duct apparently subsides promptly once the ulcer is repaired, with relief of the biliary obstruction and jaundice

COMMENT

Clinical jaundice is such a rare complication of duodenal ulcer that it is not mentioned in most writing about ulcer complications However, this being about the thirty eighth case reported of this complication is proof that it is a complication. It is thought that this is the first case to be reported in the American literature of jaundice being caused by perforation of the duodenal ulcer One is struck, though, with the similarity of this case and the one reported by Levine and Gordon[3] There is the distinct possibility that the pathology and mechanism were the same in the 2 cases

In a case of jaundice with no demonstrable stones and an 'ulcer history" it will be well to suspect a protected perforation of a duodenal ulcer Every effort to make a rapid differential diagnosis should be made, as more prompt operation is indicated in the case of perforated ulcer Probably a survey film of the abdomen and x-ray study of the duodenum will be of the most assistance.

CONCLUSIONS

1 Jaundice is a definite but relatively rare complication of peptic ulcer

2. Jaundice may be caused by a perforating ulcer kissing against the biliary tracts

3 In 376 cases of peptic ulcer reviewed, less than 1 per cent were complicated with jaundice

255 South Seventeenth Street, Philadelphia 3

## Council on Industrial Health

### INDUSTRIAL HEALTH CONFERENCE

A one day Regional Industrial Health Conference will be held in Denver at the Shirley-Savoy Hotel on June 4 under the sponsorship of the Council on Industrial Health of the American Medical Association The program will be directed by men of national and state note and will be called to order at 10 a. m Participating agencies will include besides the Council, the Chamber of Commerce of the United States of America, the U S Public Health Service Division of Industrial Hygiene, the National Association of Manufacturers the Office of Vocational Rehabilitation, Federal Security Agency, the Veterans Administration and the state medical societies of Colorado, Kansas, Montana, Nebraska, New Mexico, North Dakota, South Dakota Utah and Wyoming

The morning session will be opened by Mr Howard Strong, secretary Health Advisory Council Chamber of Commerce of the United States, Washington D C He will address the meeting on 'What Industry Expects of Medicine." Dr Victor Heiser, consultant Committee on Industrial Health National Association of Manufacturers New York will speak on the "Practical Benefits of Industrial Health Service ' The days program will include among other features two panel discussions The one in the morning is entitled Better Industrial Health Service in the States' and the one in the afternoon Rehabilitation and Reemployment Both of the Veteran and of the Disabled Civilian." The program will be closed with the showing of the new General Motors film 'The Doctor in Industry "

Because of the importance of the meeting it is urged that physicians industrialists and community leaders of the Rocky Mountain area attend this conference.

## Council on Pharmacy and Chemistry

### REVISION OF THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY

Forty-one years ago when the Council was established, it adopted a decalogue of Rules for the Acceptance of Proprietary Articles which has stood practically unchanged for these decades, with such adaptations of interpretation and application as were made advisable by changing conditions—changes in therapy in the character of drugs and in the attitude of manufacturers The Federal Food, Drug and Cosmetic Act has made into legal requirements conditions which were formerly controlled only by the Council rules and some of these rules have thereby become superfluous In view of this added protection, the Council feels that it is desirable to revise or rescind certain rules which have become more of a hindrance than a help in its endeavor to provide informed guidance in the use of drugs

One of these relates to the controversial subject of "protected" names The Council has accepted only one proprietary name for any article with the hope of checking the confusion that arises when a drug masquerades under many "aliases" It must be acknowledged that the hope has not been fulfilled. Manufacturers have continued to multiply names, and the chief result has been to remove such articles from control by the Council It has therefore been decided to withdraw this rule and to admit multiple names—with the important provision that the manufacturer give equal prominence to the common 'unprotected name that is or will be provided for example, 'atabrine" would be promoted as "atabrine, brand of quinacrine" If physicians will use the common name (quinacrine, in this example) in prescribing writing and talking of the substance, they will avoid multiplicity of names In withdrawing the rule, the Council does not wish to encourage the multiplication, it bows to reality

The Council also broadens its attitude toward "advertising to the public,' permitting such advertising when it is judged that its dangers are less than its benefits This is not a new departure it has been permitted, for instance, for the prophylactic external use of disinfectants Again, the additional protection of the Food and Drug Administration makes it possible to extend the classes of articles which may be promoted provided the promotion is carefully supervised.

The Council believes that the time is ripe for a thorough revision of its rules and has adopted the following seven principles, with explanatory comments, in the belief that this revision will increase the service that the Council may render

### OFFICIAL RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY

INTRODUCTION

The Council on Pharmacy and Chemistry was created in 1905 as a standing committee appointed by the Board of Trustees of the American Medical Association

*Activities of the Council*—The Council publishes annually a book designated New and Nonofficial Remedies (N N R.), which contains a description of proprietary preparations and articles which have been examined and accepted by the Council for inclusion in that publication The book provides statements on actions, uses, dosage, tests and standards of the preparations and articles The book also contains certain official preparations and other articles, including drug substances for manufacturing use for which there are not official standards, which the Council is of the opinion should be included for the information of the medical profession

The activities of the Council also include the preparation of special treatises, articles, status reports and books designed for the practitioner and the medical student, the giving of grants-in aid for therapeutic research, the securing of therapeutic trial of promising new preparations and the encouragement of basic research on fundamental therapeutic problems

*Acceptance of Articles for N N R*—The principles and policies of the Council concerning the acceptance of a preparation or article for inclusion in New and Nonofficial Remedies are briefly expressed in the following rules

RULES GOVERNING ADMISSION OF PROPRIETARY ARTICLES TO THE BOOK *NEW AND NONOFFICIAL REMEDIES*

*Rule 1*—COMPOSITION—The quantitative composition of preparations and articles submitted to the Council or considered by the Council for inclusion in New and Nonofficial Remedies must be made known and may be published.

*Rule 2*—IDENTIFICATION—Suitable procedures and criteria for determining the composition or standardization of the submitted preparation or article must be furnished

*Rule 3*—ADVERTISING TO THE PUBLIC.—Preparations and articles promoted to the public for use in the treatment of disease will not be accepted except as specified in the following explanatory comments

*Rule 4*—THERAPEUTIC CLAIMS—When an article is accepted, therapeutic representations by the manufacturers or their agents must be confined to those given in N N R or accepted by the Council between revisions of N N R

*Rule 5*—PROTECTED NAMES—Proprietary names for medicinal articles will be accepted if the Council deems the use of such exclusive names not to be harmful to health and if the proprietary names are not given greater prominence in labeling and other promotional activities than the official names or the nonproprietary names adopted by the Council

*Rule 6*—PATENTS AND TRADEMARKS—If a preparation or product is patented as to process or product or both, the number of such patent or patents must be furnished to the Council If the name of an article is registered or the label copyrighted, the registration (trademark) name and number and copies of the protected label must be furnished to the Council.

*Rule 7*—UNSCIENTIFIC AND USELESS ARTICLES—A preparation or an article will not be accepted if in the opinion of the Council it will not be in the best interests of the medical profession and the public.

EXPLANATORY COMMENTS ON THE RULES

*Substances Described in New and Nonofficial Remedies*—In the book will be described proprietary pharmaceutic and drug substances if they have originality or other important qualities which, in the judgment of the Council, entitle them to such place, official preparations concerning which the Council deems the medical profession not yet fully informed, or any other article the inclusion of which is believed to give useful information to the physician.

*Definition of "Proprietary Article"*—A medicinal article is considered 'proprietary' if it is protected against free competition as to name product, composition or process of manufacture, by secrecy, patent, copyright or any other means

*Previous Noncompliance*—The Council judges an article by the facts in evidence at the time of its admission. Previous noncompliance with the rules (short of intentional fraud) does not prevent at a later date the favorable consideration of an article which is in accord with existing rules

*Reconsideration*—Infringements of the rules after acceptance of an article for New and Nonofficial Remedies, or the discovery that the Council's information was incorrect, will cause the acceptance to be reconsidered and may be followed by the omission of the article and publication of the reasons for such omission.

*Acceptance Not an Indorsement*—The admission of an article does not imply a recommendation for its use. Acceptance simply means that the Council has found no conflict with its rules

*Seal of Acceptance*—For articles which are accepted for inclusion in New and Nonofficial Remedies the Council permits the use of its official seal of acceptance on the packages of an article and in the advertising for it with the following stipulations 1 If the seal is used in price lists and catalogues which also feature unaccepted articles, it must be used for accepted articles in such manner that there can be no implication that the seal applies to the unaccepted articles 2. The following statement in reference to the significance of the seal may be used in connection with the seal "The 'accepted' seal denotes that [name of article] has been accepted for New and Nonofficial Remedies by the Council on Pharmacy and Chemistry of the American Medical Association." Further statements in regard to the seal must be submitted to the Council and be found acceptable before they may be used. 3 The size of the seal on the package shall not be greater than one inch in height or diameter, and in advertising it shall be in proportion to the dimensions of the advertisement so as to afford ready recognition, but undue size, giving greater prominence to the seal than to other important features of the advertisement or detracting from the dignity of the seal in the opinion of the Council, will not be permitted. 4 When for any reason the acceptance of an article is rescinded, the seal must not appear on new labels or in new advertising for such article, and old labels and advertising which feature the seal must not be in circulation, in evidence or before the public longer than six months subsequent to notification of the revocation.

*Duration of Acceptance*—Unless otherwise determined at the time of acceptance, articles admitted to New and Nonofficial Remedies will be retained for a period of three years, provided that during that period they comply with the rules and regulations which were in force at the time of their acceptance. Evidence indicating that the compliance with the rules no longer exists, for instance, with regard to unwarranted therapeutic claims, will be considered the basis for reconsidering the acceptance before the end of a period of three years

At the end of this period, all articles will be reexamined for compliance with existing rules Particular weight will be given to the question whether claims for the therapeutic value of the preparation are sustained by recent statements in the literature and by the general esteem in which the preparation is held by clinical consultants of the Council The reacceptance of articles after such reexamination shall be for three years unless a shorter period is specified

Any amendments to the rules, by specific requirements or by interpretation, which may be made after the acceptance of an article shall not apply to such article until the period of acceptance has elapsed At the end of this period the article, if it is not eligible under the amended rules, will be omitted.

*U S P and N F Articles*—No product which has been official for more than twenty years, except preparations licensable under the Serums, Virus and Vaccine Act, will ordinarily be considered for inclusion or retention in New and Nonofficial Remedies All preparations which are licensable under the Serums, Virus and Vaccine Act, including arsenicals for the treatment of syphilis, are eligible for consideration for inclusion or retention in New and Nonofficial Remedies, regardless of their official status.

*Mineral Waters*—The Council has declared artificial mineral waters to be nonessential modifications of natural waters, that natural mineral waters are only one feature prescribed by spas and health resorts and that mineral waters are not eligible for consideration for acceptance as individual products, since there is no convincing evidence to show that the many therapeutic claims which are made for these preparations when bottled for individual use are valid

*Diagnostic Reagents*—Reagents and other drug preparations which are not used in or on the human body are not considered for inclusion in N N R At the request of the distributor the Council may determine the status of such products individually

EXPLANATORY COMMENTS

Rule 1—COMPOSITION—*The quantitative composition of preparations and articles submitted to the Council or considered by the Council for inclusion in New and Nonofficial Remedies must be made known and may be published*

*Secrecy is Out of Place in Medicine*—Intelligent prescribing requires that the physician have access to full information as

to the composition of what he prescribes An article cannot be accepted unless this information is furnished fully and truthfully Information that is not available for publication at the discretion of the Council is of no service and will not be accepted

*Statement of Composition*—In the case of a *definite chemical substance or mixture*, a descriptive name satisfactory to the Council must appear on the label and in the advertising

*Vehicles and Preservatives*—The general character of the vehicle and the identity of preservatives or of any other substance, whether added or present as an impurity, must be stated if these can under any circumstances affect the therapeutic action of the article This as a rule does not mean the publication of flavoring materials or the details of the working formula

In the case of preparations for parenteral injection the identity and amount of preservatives must be declared in the labeling, preferably on the individual container label but, when that is impracticable, on the carton label or individual package insert, in the event that no preservative is present the absence must be declared The term "preservative is intended to include all substances used for the purpose of preserving the identity, strength, quality or purity of a preparation Thus, not only bactericidal or bacteriostatic agents are required to be declared in the labeling but other chemicals, such as stabilizers, antioxidants and buffers

Preparations containing 1 per cent or more of benzyl alcohol must have this ingredient included as part of the name as benzyl alcohol in such amounts acts as a local anesthetic and would constitute a potent therapeutic agent, for example, solution sodium morrhuate 5% with benzyl alcohol 2%

The Council requires that chlorobutanol be included in the title of those preparations which contain more than 0 5 per cent of chlorobutanol unless the manufacturer can show evidence that the presence of this amount does not have therapeutic as well as antiseptic effect

*Nonofficial Constituents*—Nonofficial constituents of proprietary mixtures must be presented by the manufacturer in the regular way and must be acted on by the Council before the preparations containing them can be accepted

Constituents that are not concerned in the pharmacologic action of the preparation need not be submitted in detail, but their nature and quantity must be disclosed to the Council so that it may be judged that they are inert. The Council may require that they be declared on the label or package by such designations as will make their nature or purpose apparent.

*Deliberate Misrepresentation*—When it appears that a manufacturer has made a deliberately false statement concerning a product, he is asked to furnish an explanation and if this is not satisfactory the product will not be accepted even if the false statement is subsequently corrected or omitted

*Testimonials*—The foregoing paragraph applies not only to statements made to the Council but also to statements furnished to physicians by the manufacturer or his agents even when these statements are in the form of testimonials

*Inspection of Factories*—The Council does not routinely accept invitations to inspect factories, its concern is with the finished products If such action seems indicated, a representative may visit the factory or principal place of business and manufacture to obtain first hand information concerning the nature of the manufacturing establishment, the facilities and controls available and the nature of the laboratory and experimental facilities operating in conjunction with the plant, and for authenticating representations concerning scientific personnel and investigative projects

Rule 2—IDENTIFICATION—*Suitable procedures and criteria for determining the composition or standardization of the submitted preparation or article must be furnished*

The manufacturers of a drug should possess and supply this information, which is necessary to control the quality of an article. For *chemical compounds* this should include tests for identity, amount and purity In case of *mixtures*, methods for determining the presence and amounts of the *potent ingredients* may suffice. If the tests have been described in standard journals or other works of reference, these may be cited. The phrase *"physiologically standardized"* or "assayed" is misleading, unless the standard and method are published in sufficient detail to permit of their control by independent investigators

Rule 3—ADVERTISING TO THE PUBLIC.—*Preparations and articles promoted to the public for use in the treatment of disease will not be accepted except as specified in the following explanatory comments*

*Lay Advertising*—Indiscriminate self medication by the public involves grave dangers, such as misdirected and inadequate treatment, failure to recognize serious disease until it is too late for definitive treatment and the spread of infectious diseases when hidden from a responsible physician All these are involved in the advertising of drugs to the public, with the further dangers of suggesting by descriptions of symptoms to the minds of the people that they are suffering from diseases described the dangers of the unconscious and innocent formation of a drug habit and the dangers of starting allergic reactions

*Drugs Which May Be Promoted to the Public*—These dangers do not apply in equal degree to all articles, and there are instances in which more good than harm is likely to result from advertisements conveying truthful information to the public, if they do not mislead by undue emphasis or suggestion The proper promotion of such articles will not preclude their admission to New and Nonofficial Remedies, but, in view of the potential dangers to the public, such cases must be carefully weighed and will be confined to the following groups (*a*) disinfectants, germicides and antiseptics, provided they are promoted only as prophylactic applications to superficial cuts and abrasions of the skin, (*b*) laxatives when promoted in such a manner as is not likely to lead to their abuse, (*c*) antiserums and fractions thereof vaccines and diagnostic reagents derived from infectious agents, (*d*) other preparations and articles which in the opinion of the Council could be safely used by the public for the relief of symptoms (such as antacids and analgesics) Each group will have to carry adequate and acceptable labeling statements such as "for the relief of minor aches and pains" for analgesics, and "for the treatment of occasional constipation" for laxatives

*Unacceptable Advertising to the Public*—Aside from these specified groups, promotion of articles to the public for the treatment of disease precludes the admission to New and Nonofficial Remedies "Advertising to the public" includes all promotion of the article in newspapers, magazines, placards or circulars, as it may reach the patient, radio, films or any other devices This also includes label and labeling of drugs

This rule imposes no restriction on the legitimate methods of bringing a remedy to the attention of the profession, such as advertising in journals, labeling, circulars and other printed matter distributed solely to physicians, dentists, pharmacists and veterinarians, provided such promotion does not invite or encourage use by unqualified persons

Advertising the name of a firm as being a reliable one is permissible in any advertising medium.

*Naming Diseases on Label and Labeling*—The naming of diseases and therapeutic indications in the labeling may be necessary for proper instruction in the use of articles sold directly to the public and is therefore permissible in the case of the preparations which are accepted for promotion to the public.

*Permanently Affixed Names*—If a prescribed article is dispensed in its original container, any permanently affixed device that identifies the article to the consumer constitutes advertising to the public. This includes bottles which have the name of the article blown into the glass, and other devices by which the name or initials or other distinctive mark of the article is permanently stamped on the container, on the article itself, or

is on the stoppers or seals. Readily removable labels are not objectionable nor is the permanent affixing of the firm's initials or name to the trade package if such initials or name is not suggestive of the article.

*Use of Accepted Articles for Advertising Unaccepted Articles.*—The Council does not countenance the use of an accepted article for advertising other articles which have not been accepted by the Council. The Council therefore objects to the mailing of circulars for accepted and unaccepted articles in one envelop if there is reason to believe that the method of presentation may mislead the reader and if it is not made clear beyond doubt, for instance by the initials N. N. R., which of the products have been accepted by the Council and which have not been accepted. This clause does not apply to advertising material circulated exclusively to dealers.

When, in the opinion of the Council, a firm secures the acceptance of one or more articles and employs the acceptance in a way that promotes the exploitation of articles that are opposed to the principles of the rules of the Council, this may be considered as evidence of bad faith which may cancel the acceptance of all preparations of that firm.

*Acceptance of Article Offered Under Another Name.*—The Council will not accept an article or continue the acceptance of an article if the same article or an essentially similar one is marketed in the United States by the same firm under another name which has not been recognized.

*Advertisements in Foreign Countries.*—The Council may take into consideration any statements made regarding an article or any method of advertising employed by the manufacturer or his authorized agents or representatives, whether in this country or abroad. No objection will be raised to the use of a statement such as "This substance is accepted by the Council on Pharmacy and Chemistry of the American Medical Association under the name of ____" when such a statement is used in the promotion of a Council accepted preparation sold outside the United States under another name, provided the firm makes no misleading claims and meets the other rules of the Council.

The Council does not regard as within its scope the acceptance of articles marketed solely outside the United States.

*Films.*—The Council holds that the term "advertising" includes "advertising literature," films and similar devices for informing the public or profession.

Rule 4.—Therapeutic Claims.—*When an article is accepted therapeutic representations by the manufacturers or their agents must be confined to those given in N. N. R. or otherwise accepted by the Council.*

*Unwarranted Therapeutic Claims.*—Manufacturers or their agents are held responsible for all statements made or quoted in any of their advertising concerning the therapeutic properties of their products. These must be compatible with demonstrable facts.

*New Claims.*—Claims that are not in harmony with already accepted facts or supported by acceptable evidence cannot be admitted. Therapeutic claims made subsequent to the acceptance of an article must be submitted to the Council for review if such claims exceed, or substantially modify, those made at the time of acceptance.

*Claims for Nontoxicity.*—Claims for nontoxicity are admitted only when they do not conflict with known facts. Physicians are cautioned that a claim of lack of toxicity means only that toxic effects have not as yet been recognized with the doses that have been studied. Apparently justified beliefs concerning this point are often ultimately reversed by extended experience. The same may be said regarding claims that drugs are nonirritating.

*Clinical Evidence.*—To be acceptable the clinical evidence must offer objective data with such citation of authority as will enable the Council to confirm the facts and establish the scientific value of the conclusions. The amount and character of the evidence which is required depend on the inherent probability of the claims; no evidence is needed for a self-evident claim, very strong evidence is needed when the claim is contrary to the accepted data of science. The acceptability of evidence is determined mainly by its quality. Multiplication of inaccurate observations does not render them accurate. The evidence must be furnished in sufficient detail to permit judgment as to the care with which it was gathered and the legitimacy of the deductions. Comparative trials facilitate and are often necessary for such judgment. Observations that are not described with sufficient detail to permit verification are subject to suspicion. The credibility of the data and the justification of the deductions are influenced by the reputation and experience of the investigators as to disinterestedness, technical ability and critical judgment. Anonymous communications and observations gathered without adequate facilities are usually worthless as evidence.

In passing on advertising material, the Council endeavors to indicate the type of claims which are acceptable and the nature of objectionable statements. It is not a function of the Council to edit advertising copy word for word, but rather to indicate the general type of revision required in any given piece of advertising copy. The Council holds the firm responsible for compliance with the specifications of the Council's objections and expects the spirit and intent of such objections to be observed in the remainder of the copy not specifically criticized.

*Advertising Copy.*—Advertising copy which has been accepted by the Council may be used in whole or in part in later advertising without further submission for examination, provided this does not exceed the scope, content and purpose of the original material and provided there have not been any developments which would invalidate the original material. In doubtful cases the Council considers these questions with the advice and cooperation of its clinical consultants. Therapeutic claims that do not exceed the statements in the currently accepted advertising will not be challenged as a rule, but if the Council finds reason to doubt the validity of any description in New and Nonofficial Remedies it may require the manufacturer to submit further evidence if he desires to continue such claims.

As new pieces of advertising copy are prepared they should be made available for Council examination or Council files. Since the claims of the manufacturer are judged largely by their advertising, noncompliance of the manufacturers with the Council's request for copies of the current advertising may be sufficient ground for the rejection of an article.

*References to Medical Literature.*—References to medical literature in advertising for an accepted product should be accompanied by the name of the investigator and year of publication or by full reference to the publication to which reference is made.

*Use of Physician's Signature.*—The use of the personal signature of a physician or the facsimile of such signature on the label or in advertising of products tends to create an exaggerated or misleading impression of therapeutic value, through the implication of personal supervision, and articles so labeled or advertised are therefore not acceptable.

Rule 5.—Protected Names.—*Proprietary names for medicinal articles will be accepted if the Council deems the use of such exclusive names not to be harmful to health and if the proprietary names are not given greater prominence in labeling and other promotional activities than the official names or the new proprietary names adopted by the Council.*

*Advantage of Nonproprietary Names.*—The Council believes that medical science is promoted by the use of a single name for each drug, based on scientific principles and freely available to all. This would avoid much needless tax on memory with its attendant confusion and errors.

*Rights to Protected Names.*—On the other hand the Council recognizes that the discoverer of a new remedy has a legal right to a restricted name and that the manufacturer who undertakes the expense of its practical development has a right

to some protection and may not feel justified in undertaking the risk if this right is denied

The Council has therefore conceded acceptance of a proprietary name to the discoverer or to the firm which first introduced the article. Experience has shown, however, that this restriction to one proprietary name tends to undue prolongation of the monopoly and that it prevents the control of the Council over competing brands which could be made acceptable except that they employ competing proprietary names The Council therefore deems it advisable to accept several proprietary names for the same article, provided there are no reasons which would render this especially objectionable and harmful and provided the proprietary name is not given more emphasis in the advertising and labeling than the nonproprietary name provided by the Council or the U S P or N F This means that accepted drugs should always be identified by adding the nonproprietary or official name when the proprietary name is used, as, for example, "Luminal, brand of phenobarbital," and Benzedrine, brand of amphetamine"

Physicians can protect themselves against much confusion by using the official names in speaking or writing of these drugs

*Objectionable Names*—Names which are misleading or which suggest diseases, pathologic conditions or therapeutic indications will not be recognized (the provision against therapeutically suggestive names does not apply to serums, vaccines and antitoxins) In the case of pharmaceutic preparations or mixtures the name must be so framed as to indicate clearly the most potent ingredients Coined names for salts will not be accepted unless such names indicate the components of the salt, coined names for new substances marketed as pharmaceutic preparations will not be accepted unless such names indicate definitely the type or dosage form of the article.

*Proprietary Names for Unoriginal Articles*—Proprietary names will not be recognized for articles which are included in the U S. Pharmacopeia or National Formulary unless the name was in public use before the drug was admitted to these books

In the marketing of unoriginal articles the legitimate interests of the producer are sufficiently served by identifying such products by appending the name or initials of the manufacturer or agent or by the use of a general brand mark No objection will be made by the Council to the use of such brand marks, provided that in no case shall such mark be used solely as a designation for an individual article. Names, initials or brand marks of manufacturers or agents when used to denote proprietorship shall not be of such character as to cause any misunderstanding or confusion as to their significance

*Attitude on Mixtures*—The Council endorses the principle that prescriptions should be written on the basis of the therapeutic effects of the individual ingredients For this reason there are included in N N R. only those mixtures that present some real advantage

*Pharmaceutic Preparations and Mixtures*—A proprietary name may be accepted for pharmaceutic mixtures on the ground of originality and if it is a distinct improvement over available preparations This is exceptional, for pharmaceutic preparations rarely involve sufficient originality and it is important that their names should remind the prescriber of their potent ingredients The Council recognizes, however, that the development of the practice of pharmacy has been along lines which make it undesirable at times to prepare complicated ointments and suppositories and that there is a tendency for such preparations to be manufactured ready-made by the manufacturers for prescription by physicians

The Council may also recognize coined names for pharmaceutic preparations or mixtures that were in actual use before the establishment of the Council and that have been used continuously since that time, and names for mixtures that were named under the reasonably justified bona fide belief that they were chemical compounds, provided such coined names are not otherwise objectionable.

*Coining of Name*—The Council recommends that trade names be coined so as to indicate the potent element or constituent

*Naming Salts*—Difficulty frequently arises from the application of coined names to salts. For example, a firm introduces the hydrochloride of a synthetic base under the name "Artificialine ' Subsequently the firm decides to introduce the lactate of the same base If this is called "Artificialine lactate" the name "Artificialine" will now mean the base instead of the hydrochloride which is being marketed under that name. In order to avoid this confusion the Council holds that coined names for salts will not be accepted unless such names indicate the components of such salts, thus "Artificialine hydrochloride", the name "Artificialine," unqualified, is acceptable only for the base

A similar difficulty may arise when a product is marketed first only as a pharmaceutic preparation to which the manufacturer wishes to apply a short coined name, for example, an elixir of a new hypnotic under the name 'Aliphal" If later the manufacturer elects to market the substance also in powder form, an entirely new name would become necessary and this would cause confusion both to the profession and to the trade The Council therefore holds that coined names for new substances marketed as pharmaceutic preparations will not be accepted unless such names indicate the type or dosage form of the preparation, thus "Elixir of Aliphal," 'Aliphal Powder," not 'Aliphal" unqualified

For declaration of benzyl alcohol or chlorobutanol in the name of a product, see comments under Rule 1

*Use of Numerals and Letters*—Since the use of numeral or alphabetical designations in connection with drug names tends to take the emphasis away from the name and to displace the name, thus leading to confusion, the Council does not accept the name of a drug in which the numeral or letter is an integral part of the name except in special cases in which the use of a numeral or letter seems desirable, for instance, because further improvement of the product is anticipated, in which case the Council may grant a special exemption from the rule. Under this rule the use of numerals or letters in connection with the name of a product will not be permitted on labels or in advertising unless the numeral or letter is clearly separated from and subordinated to the name by type and if feasible by position This rule shall not apply to price lists and catalogues

*Biologic Products*—A biologic product intended for use as a diagnostic reagent, vaccine or antibacterial or antitoxic serum should be designated by a name which indicates its biologic nature, e. g tuberculin rabies vaccine, diphtheria toxoid, diphtheria antitoxin A proprietary name will be recognized for inclusion in N N R only if it clearly indicates the nature of the product.

Rule 6—PATENTS AND TRADEMARKS—*If a preparation or product is patented as to process or product or both the number of such patent or patents must be furnished to the Council If the name of an article is registered or the label copyrighted, the registration (trademark) name and number and copies of the protected label must be furnished to the Council*

This information is essential to determining the legal status of the article. If it is registered in a foreign country under a different name, this information should also be supplied so as to identify the article in the foreign literature.

Rule 7—UNSCIENTIFIC AND USELESS ARTICLES—*A preparation or an article will not be accepted if in the opinion of the Council it will not be in the best interests of the medical profession and the public*

Useless drugging is apt to be harmful This precludes the acceptance of articles which have no definite therapeutic value, of compounds or mixtures with an excessive number of active ingredients or with ingredients that are of no probable assistance to each other, and of articles which involve dangers of toxic effects disproportionate to their therapeutic value.

SATURDAY, MAY 18, 1946

## THROMBOSIS AND EMBOLISM

The term thromboembolic syndrome has been used increasingly to emphasize the direct association often existing between the formation of thrombi in the deep veins of the legs and pulmonary embolism Thrombosis in the veins of the legs is believed to be responsible for approximately 95 per cent of the cases of pulmonary embolism

Allen [1] points out that the peak incidence of thrombosis and embolism occurs in the winter months (about one third of all cases) and the lowest incidence during the summer Fewer cases of this type are reported in New Orleans than in Boston, it is suggested that they are milder and more amenable to treatment by sympathetic block in the former city Age is important In Allen's clinic only 5 7 per cent of the patients with thrombosis and embolism were under 30 years of age and 12 per cent were between 30 and 40, leaving over 80 per cent above the age of 40

Allen says that there are two definite methods of preventing fatal embolism available at this time One is the use of anticoagulant drugs, such as heparin and Dicumarol (3,3'-methylene-bis-[4-hydroxycoumarin]), which are often effective if properly used The second method is prophylactic interruption of the femoral vein Up to Oct 1, 1945, 816 patients at the Massachusetts General Hospital had received the latter procedure In nearly one half (47 3 per cent) this technic was employed because of the presence of definite signs and symptoms indicating thrombosis in the leg veins Signs of infarction in the lungs was present in 34 4 per cent, and in 18 3 per cent prophylactic interruptions were carried out because of age or the presence of an acute disorder which would indicate a high degree of probability of the development of thrombosis during treatment Although the operations have been performed almost entirely by the resident staff, fatalities have not occurred and only one death from a massive embolus has developed following femoral vein interruption This, incidentally, came from the profundi femoris vein eight days after the superficial femoral vein had been ligated

Some patients received heparin or Dicumarol therapy following femoral vein interruption with the hope of diminishing the extension of thrombosis in other veins and thus preventing or lessening further infarcts Of 101 patients in one group who received Dicumarol postoperatively, three instances of thromboembolic phenomena occurred As is well known, however, both heparin and Dicumarol have numerous contraindications and must be administered with great care. Prophylactic bilateral superficial femoral vein interruption, however, is, according to Allen, a safe and harmless procedure and prevents postoperative thrombosis and embolism This, he says, is particularly suitable for the older patients Dicumarol in small doses is useful in selected patients as a preventive against thrombosis and embolism, especially in conjunction with femoral vein interruption When Dicumarol is used, it is imperative for the safety of the patient to carry out careful laboratory observation on the plasma prothrombin time both preoperatively and after the administration of this substance

Elsewhere in this issue (page 196) appears another thoughtful discussion of the subject Bauer [2] emphasizes especially the importance of early diagnosis of thrombosis in the deep veins of the leg The signs of such thrombosis commonly mentioned in the textbooks are not enough to allow as early diagnosis as is desirable if the best results are to be achieved Every inexplicable rise of the pulse and temperature curves, he says, as well as symptoms from the lungs, such as even slight pain in one side of the chest, must arouse suspicion of the presence of a thrombosis Examination of the lower part of the patient's leg should then follow If pronounced swelling, cyanosis and tenderness along the back of the calf are found, diagnosis is easy, but the thrombosis must be considered advanced, tenderness over a certain segment to deep palpation applied to the back of the calf is the most constant early sign and is considered a probable indication of the presence of thrombosis Phlebography is extremely important as an aid in diagnosis and should, he believes, constitute a routine method at all hospitals in cases of suspected early thrombosis

Once diagnosis has been made, especially at an early stage, Bauer prefers heparinization This consists in intensive heparin treatment together with active forceful movements of the legs beginning at once Patients subjected to this treatment are required to leave the bed one day before the administration of heparin is discontinued

1 Allen Arthur W Thrombosis and Embolism Bull New York Acad. Med 22 169 (April) 1946

2 Bauer Gunnar Heparin Therapy in Acute Deep Venous Thrombosis this issue p 196

The evidence presented by Bauer may not be enough to convince every student of the thromboembolic syndrome that this is the treatment of choice Such studies, however, reflect an increasingly active interest in this frequent cause of sudden death and disability Early and drastic improvement in the methods of prevention and management of the thromboembolic syndrome are foreshadowed by studies such as those cited

## HYPERPYREXIA IN INFANCY AND CHILDHOOD

In his clinical study of fever in infancy and childhood up to 12 years Åkerren [1] analyzed 232 cases of various acute conditions in which the temperature reached 105 8 F at least once The death rate of the whole group was 56 per cent In 121 cases of acute fever in which a definite specific illness was not demonstrated the death rate was 97 per cent The tendency to high fever was especially apparent in the infants under the age of 2 years, in certain cases hyperpyrexia alone seemed to be the cause of death Other symptoms besides the fever included disturbed consciousness, convulsions, coma, hurried breathing, weak and rapid pulse, paleness—a clinical picture which Åkerren called the hyperpyretic syndrome, a term previously used in French writings In the treatment of this condition reduction of the temperature is the first step In the prevention of hyperpyrexia everything that tends to increase the temperature of the body—excessive warmth of clothing, overheated rooms and similar factors—must be avoided in the handling of infants and children with fever

Under the term "le malin syndrome," the malignant syndrome, Hutinel [2] and other French pediatric writers have included the grave weakness and the general functional disturbances in many etiologically distinct acute infectious diseases, particularly in children This syndrome was one of the main topics discussed at the last French pediatric congress before the war In a second article on the hyperpyretic syndrome Åkerren [3] states that Marquezy and Ladet found hyperemia, hemorrhages and lesions of ganglion cells in the sympathetic system and in the brain of children who died in the course of "the malignant syndrome" In the lungs, liver, kidneys and other organs a hyperemia was found seemingly due to dilatation and stasis of the capillary and precapillary vessels Now Åkerren is strongly impressed with the similarity of the clinical manifestations and the lesions in the syndrome to those of shock as described by Moon [4] and others, with the exception that the syndrome frequently is associated in nurslings and young children with hyperpyrexia In heat stroke, however, in which the lesions are like those of traumatic shock, hyperpyrexia does develop The observer concludes again that hyperpyrexia may have a direct causal effect in the syndrome He has observed surprisingly rapid recovery in serious cases of what he called the hyperpyretic syndrome and now calls the hyperpyretic form of "malignant syndrome," on energetic reduction of the temperature by artificial means Reports by French surgeons are cited on the value of cooling the body in operations on hyperpyretic infants

As this matter now stands, the malignant syndrome of the French—a less confusing term is needed—appears to be a shocklike condition with a hyperpyretic form The benefit of antipyretic treatment suggests that hyperpyrexia may be the primary factor in this form of the syndrome *In febrile states of nurslings and young children the greatest care should be taken to control the hyperpyrexia*

## NEW RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY

The Council on Pharmacy and Chemistry has recently made a thorough study of its rules for the consideration of preparations for inclusion in New and Nonofficial Remedies The results of this study may be found on pages 215 to 219 of this issue of THE JOURNAL

There have been many changes in therapy since the Council was organized in 1905 At that time secrecy and flamboyant exploitation were the order of the day With the honorable exception of a few manufacturers or sponsors of remedies who were sincerely desirous of fully and honestly informing the medical profession, commercial drug interests evidenced no desire to set forth exactly the true status of many widely advertised remedies The need for an organization such as the Council was recognized by every one interested in progress Many favorable comments were received from drug houses when they were informed of the organization of the Council Typical of these comments was one from an eastern firm, stating in part " it is the most important step taken in recent years in this country, as it holds out at least a ray of hope to the manufacturers who are trying to conduct an honest and ethical business "

Since 1905 drug therapy has undergone remarkable improvement Physicians have learned to appraise drugs with a more critical eye, drug and pharmaceutical houses have added to their staffs informed and well known scientists, new and remarkably effective drugs with specific actions have been developed and, of great importance, the Food and Drug Administration under the Federal Food, Drug and Cosmetic Act has exerted a highly salutary influence on the marketing of drugs Thus the Council feels that it can now revise or rescind certain rules so that it may encourage to the best of its ability continuous progress in rational therapeutics

This is one of the reasons why the Council is extending its facilities to aid in the investigation of new drugs through its Therapeutic Trials Committee

The new rules of the Council now number seven instead of the former eleven Prominent in the revisions are changes in the comments covering proprietary names and advertising to the public, all of which reflect the willingness of the Council to meet changing conditions and to continue its leadership When the history of this body appears in the special publications to be sponsored by the American Medical Association at the time of its centennial celebration, the contributions of this "medical watchdog' will become a matter of proud record All who have participated in its activities have reason to look back with satisfaction and forward to the continued support of the medical and allied professions

## Current Comment

### THE PROBLEM OF CHRONIC ALCOHOLISM

The Research Council on Problems of Alcohol says in a recent publication [1] that 50,000,000 persons in the United States use alcoholic beverages, of whom approximately 6 per cent become excessive drinkers, and of this number 25 per cent become chronic alcoholic addicts This makes a total of 1 5 per cent of all drinkers, or some 750,000 who become alcoholic addicts In addition to the 750,000 chronic alcoholic addicts there are about 2,250,000 other kinds of excessive drinkers There are about 13 500 persons in the United States with an alcoholic psychosis The cost of caring for alcoholic addicts in the mental hospitals of the United States, as of 1940, is approximately $13,000,000 a year The cost of maintaining drunken persons in jails is about $25,000,000 a year The cost to society of crime associated with habitual excessive drinking is estimated to be over $175,000,000 a year The council stresses that ignorance regarding the problem of alcoholism and lack of funds hinder the development of remedial measures Annual appropriations and contributions to official and voluntary agencies for work with alcoholic addicts total about $500,000, compared with $130,000,000 to $160,000,000 for tuberculosis and $16,000,000 to $19,000,000 for infantile paralysis In Sweden before the war there were ten state hospitals devoted exclusively to the treatment of alcoholism, in Switzerland seventy dispensaries where an alcoholic addict could go for free advice and where institutional care could be arranged, and in the Netherlands there is a consultation bureau in each of the larger cities In the United States municipal, state and federal governments have made no such facilities available In most communities the only public institution willing to accept an alcoholic addict is the jail In some large cities the municipal hospital will accept alcoholic addicts only for sobering up treatment In many of these hospitals, as well as in many jails, conditions are crowded and insanitary The estimated amount spent by the people of the United States for alcoholic beverages in 1944 was over $7,000,000,000 The estimated amount paid for radio, newspaper and magazine advertising by national advertisers in the liquor industry in 1940 was over $27,920,000 The council calls attention to the fact that in the absence of an intelligent remedial program a satisfactory solution of the problem is not possible Millions have been spent for prohibition, millions for repeal, millions for prohibition again, millions to induce people to drink, millions to stop them drinking The Research Council proposes greatly expanded research on the nature and treatment of alcoholism, the personality of the alcoholic addict and related subjects It also recommends the development of more adequate hospital facilities and increased education, together with industrial and legal controls Reports on the council's research will be available to doctors, scientists and other interested persons The Research Council on Problems of Alcohol is one of five national agencies dealing with the problem of alcoholism The other four include Alcoholics Anonymous with over 20,000 members in 600 or more local groups, the Section on Alcohol Studies of the Laboratory of Applied Physiology at Yale University, which operates two clinics and has held three summer schools on the problems of alcohol, the Quarterly Journal of Studies in Alcohol, the National Committee on Education for Alcoholism with headquarters in the New York, which employs a national lecturer who has been active in promoting local committees, and the National Committee on Alcohol Hygiene of Baltimore, which provides speakers and publishes a bimonthly periodical

### ARE AMERICAN FAMILIES GROWING LARGER?

More than three million babies were born in 1945, reflecting the increase in the birth rate of the United States between 1933 and 1943 of 30 per cent According to the calculations by Burch [1] this does not mean that the average American family is growing larger The principal explanation for the increase appears to be the rise in the marriage rate and the increase of one and two child families This is deduced from the analysis of the increase in the first, second, third and fourth or higher births in the family Thus, during the war years 1941 to 1943 the birth rate for all women in the reproductive age increased 22 per cent, first births increased 21 per cent second births 31 per cent, third births 27 per cent, fourth births 19 5 per cent and fifth births 11 5 per cent Sixth and seventh births increased 3 per cent, but births of eight or over decreased 3 per cent The conclusion is that the increase in the birth rate is due almost entirely to the increase of one and two child families rather than to enlargement of existing families The trend has implications for many aspects of American society, including the provision of medical care

# MEDICINE AND THE WAR

## ARMY

### BRIGADIER GENERAL MALCOLM C GROW APPOINTED AIR SURGEON

Brig Gen Malcolm C Grow was recently appointed Air Surgeon of the Army Air Forces, replacing Major Gen David N W Grant, now retired General Grow was responsible for the establishment of the Aero Medical Laboratory the Eighth Force Personal Equipment Office, the preparation of AAF Air-Sea Rescue Ditching instructions and the 'flak suit' and helmet for air crews

### ARMY MEDICAL DEPARTMENT PRAISED FOR PSYCHIATRY CONTRIBUTIONS

Dr Arthur H Ruggles chairman of the Committee of Neuropsychiatric Civilian Consultants to the Secretary of War, recently commended the Army Medical Department for its "outstanding contribution to the advancement of psychiatry in World War II" Dr Ruggles, medical director of Butler Hospital, Providence, R I, attributed the 'extremely low percentage of the major mental disorders' in World War II to the Army's 'efficient and effective methods of early treatment of the less severe nervous disorders"

### EXHIBIT ON PHYSICAL THERAPY AND RECONDITIONING EXERCISES

A joint exhibit illustrating the physical therapy and physical reconditioning exercise programs conducted by the Army Medical Department was recently presented by the Physical Reconditioning and Physical Therapy Branches, Office of the Surgeon General, at the national convention of the American Association for Health Physical Education and Recreation. The exhibit included charts posters and photographs illustrating the physical reconditioning and therapy procedures and remedial and developmental exercise apparatus

### KENNEDY GENERAL HOSPITAL CITED

The Meritorious Service Unit Plaque was recently awarded to Kennedy General Hospital, Memphis, Tenn for "superior performance of duty in the performance of exceptionally difficult tasks during the period from Jan 1 1943 to Jan 1, 1946' During those three years the hospital cared for more than 45,000 patients

### ARMY AWARDS AND COMMENDATIONS

#### Colonel William J Bleckwenn

The Legion of Merit and the Oak Leaf Cluster were recently awarded to Col William J Bleckwenn, Madison Wis, "for exceptionally meritorious conduct in the performance of outstanding services in the Southwest Pacific Area from March 4, 1942 to Oct 15, 1943" Colonel Bleckwenn, according to the citation "commanding a medical regiment, planned and established two United States army hospitals in Northern Territory, Australia where extensive air operations were being carried out by the United States Army Air Forces Providing vitally needed hospital facilities in an area from which evacuation was difficult he was instrumental in saving the lives of many wounded officers and men. In January 1943 at an advance base in New Guinea he employed his own troops for labor and, utilizing salvaged materials at hand, constructed a model 1 000 bed general hospital Responsible for all medical installations throughout New Guinea, Colonel Bleckwenn established the first neuropsychiatric service in that region and was responsible for the rehabilitation of many patients, who returned to their units without further hospitalization From June to November 1943 he directed preparations for the medical support of military operations along the north coast of New Guinea By his outstanding professional skill resourcefulness and organizing ability, Colonel Bleckwenn made a noteworthy contribution to the support of military operations in Australia and New Guinea"

The citation accompanying the Oak Leaf Cluster stated that 'Col William J Bleckwenn, rendered distinguished service as consultant in neuropsychiatry Sixth Service Command, from July 1944 to November 1945 With a background of rich experience in the actual handling of nervous and mental casualties in the combat area, he displayed unusual foresight and understanding in organizing the program of treatment for mentally disabled returnees" Dr Bleckwenn graduated from Columbia University College of Physicians and Surgeons, New York, in 1920 and entered the service April 18 1941

#### Lieutenant Colonel Johnson F Hammond

The Legion of Merit was recently awarded to Lieut. Col Johnson F Hammond editor of the *Bulletin of the United States Army Medical Department* for his work in developing "this journal into an invaluable means of relaying the latest authoritative medical developments to medical officers all over the world His achievements signally contributed to the welfare of the sick and wounded in World War II Dr Hammond graduated from Rush Medical College, Chicago, in 1910 and from the Army Medical School Washington D C, in 1911 He was commissioned in the Regular Army Medical Corps in 1912 He served until 1920, when he was retired for physical disabilities In 1922 he joined the staff of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION and was assistant editor of THE JOURNAL at the time he was recalled to active service in August 1943

#### Major Richard L Etter

The Bronze Star was recently awarded to Major Richard L Etter, formerly of Houston Texas 'for meritorious achievement in connection with military operations against the enemy in Germany from April 2 to May 9, 1945 Directing the operations of the clearing station of an infantry division" stated the citation 'Captain Etter rendered outstanding service throughout this combat period During the crossing of the Sieg River when exceptionally heavy casualties taxed the facilities of the clearing station to capacity Captain Etter worked night and day to provide the best possible care for all the wounded With his station seriously understaffed and frequently on the move in order to keep contact with attacking elements it was only by tireless efforts that he was able to furnish timely medical and surgical care for the troops Captain Etter's fine service as an officer and a surgeon assisted materially in maintaining combat morale and reflects great credit on himself and the armed forces" Dr Etter graduated from George Washington University School of Medicine in 1943 and entered the service Dec 28, 1943

#### Major Allan B Crunden Jr

The Legion of Merit was recently awarded to Major Allan B Crunden Jr Montclair N J, chief of the plans branch, Office of the Air Surgeon, for his work as a staff officer and medical instructor at the AAF School of Applied Tactics from January 1943 to March 1945 According to the citation, Major Crunden 'conceived and expedited the preparation of reference manuals as well as the development of various standard instructional publications to meet the training needs of personal equipment officers throughout the Army Air Forces In successfully establishing this efficient and effective training program he performed an outstanding service which reflects great credit on himself and the armed forces of the United States" Dr Crunden graduated from Temple University School of Medicine, Philadelphia, in 1938 and entered the service June 23, 1942

# ORGANIZATION SECTION

# THE WAGNER-MURRAY-DINGELL BILL

## Hearings on S 1606—To Provide for a National Health Program

(NOTE.—*This is a condensation of the verbatim report of the hearings*.—ED.)

*(Continued from page 167)*

United States Senate, Committee on Education and Labor

APRIL 16, 1946

AFTERNOON SESSION

HONORABLE JAMES E MURRAY Presiding

PRESENT Senators Murray Pepper, Tunnell Smith and Donnell

SENATOR MURRAY This morning there was some question raised with reference to the question as to whether or not the bill the pending bill, had any provision for preventive medicine, and I wish to call attention at this time to section 213 of the bill on page 63 which provides as follows

Section 213 For the purpose of encouraging and aiding the advancement and dissemination of knowledge and skill in providing benefits under this Act and in preventing illness disability and premature death etc

Again over on page 65, subdivision (b) of section 214 provides as follows

(b) The term general medical benefit means services furnished by a legally qualified physician or by a group of such physicians including all necessary services such as can be furnished by a physician engaged in the general or family practice of medicine at the office home hospital or elsewhere including preventive diagnostic and therapeutic treatment and care and periodic physical examination

I believe there is reference also to preventive medicine in some other parts All through title I, in the grants to states you will find references to preventive medicine which it stresses

SENATOR DONNELL Yes, sir

SENATOR MURRAY The first witness this afternoon is Dr Lowell S Goin Before we call on Dr Goin I wish to have inserted into the record a number of the statements which have been received from medical societies around the country, and I have been requested to have these put in the record

I would like to insert into the record at this point the statement that has been filed by the State Medical Association of Texas

SENATOR MURRAY The statement of the State Medical Association of Texas refers to a schedule of benefits provided by the Blue Cross Plan in Texas and a copy of this document will be filed with the committee for the information of the committee

(The pamphlet 'Blue Cross Comprehensive Service for the Whole Family Dallas, Texas,' is filed for the information of the committee)

SENATOR MURRAY There will also be inserted into the record at this point a statement from the New Mexico Medical Society, a statement from the Academy of Medicine of Cleveland and a statement from Dr Franz Goldmann associate clinical professor of the Yale University School of Medicine

SENATOR MURRAY I would also like to insert into the record at this point statements from Dr R. C Kash of Lebanon, Tenn and Edwin L Page of Concord, N H

### Statement of Dr Lowell S Goin of Los Angeles

DR. GOIN I am Lowell S Goin of Los Angeles I am a practicing physician, and I happen to be president of the California Physicians Service, which is a voluntary health care plan of California, and I am also president of the College of Radiology and the Radiological Society of North America I feel a great sympathy for the objectives which are hoped to be attained by the enactment of this bill, and I admire the humanitarianism of those who work so hard for their attainment There is not the slightest doubt that the sudden and unpredictable imposition of heavy costs for medical care is frequently catastrophic The physicians of America are well aware of this and, individually and collectively, have devoted much time and energy to an attempt to solve the problem They believe that a solution is becoming apparent and that, given reasonable time, will be reached They believe that the solution will be a better one than that currently proposed and that more medical care, and much better medical care, will be available to the American people if voluntary plans are allowed to evolve than if compulsory health insurance becomes law If it be argued that no voluntary plan completely meets the need, I reply that that is true, but that evolution is not a rapid process and that, in a field in which there is little or no experience, haste must be made slowly That this is likewise true in government controlled compulsory health insurance plans is shown by German and British experience Title II of S 1606 (for example) contains seventeen sections, but the German insurance law had (before the war) grown to more than 3,300 sections—a certain indication of the complexity of the problem and of the impossibility of composing a neat and effective solution

The American Medical Association, speaking (I am confident) for the overwhelming majority of American physicians, opposes this legislation on five grounds

1 The existence of a need for it has been established more by emotional statements than by logic and documented facts

2 Even if the need were soundly established there is no experience to indicate that compulsory health insurance would benefit the public health, although there is some reason to believe that it would lower the health standards

3 The costs are totally unpredictable, and no one has even a fair idea of what such a program would cost

4 Medical care is not the sole factor involved in good health, and there are many things that could properly be done to benefit the public health before we embark on a program such as is proposed

5 Voluntary health plans are more in keeping with the American tradition and will result in far better care being given to our people

I should like now to discuss each of these five points in turn

1 The social planner maintains that the state of health of the American public is deplorable and that medical neglect is a commonplace occurrence. The reason, they say, is the interposition of a financial barrier between the sick man and the doctor and argue that to remove this barrier will solve our health problem Last fall the President of the United States in a message to Congress pointed with horror to the shocking figures of Selective Service rejections as an indication of the dire need for the enactment of compulsory health insurance. Is it of no significance that our mortality and morbidity rates are among the lowest in the world? Is it an accident that the United States now leads the world in medical education? Is our constantly increasing expectancy of life a reflection of our deplorable state of health? Do you know that the American death rate for diphtheria is about one-half that of Great Britain or prewar Germany? Diphtheria incidentally, is an excellent indicator, since it is one of the few diseases for which we have specific preventive and curative measures, and since, there being no secrets involved, the German and British physicians know as well how to treat it as do Americans

So much has been made of the Selective Service rejection figures, the 5 000 000 4-F's that they deserve a moment of special attention Senator Pepper's interim report analyzes the 4,217,000 rejectees and breaks them down into groups

444 800 were rejected as "manifestly disqualified" These include the armless and the legless, the totally blind, the totally deaf, the deaf mutes, and so on. What medical care could have made this group whole? How shall the amputated leg be restored, and who knows how to cure optic disease? The modern concept is that mental disease is largely a constitutional inborn inability to cope with reality What has medical care to do with it? 582,100 were rejected for mental deficiency That is to say, they simply lacked the intelligence to become soldiers or sailors or, indeed, useful citizens of any sort. They are the idiots, the imbeciles and the low grade morons Even a very slight knowledge of eugenics will persuade any one that this group does not constitute a medical care problem. Together, these three groups reach a total of 1,727,600, or more than one third of the rejectees If they are now excluded, there remain 2,426,500, a little less than one half the famous 5,000,000 320,000 of these were rejected for musculoskeletal defects

SENATOR DONNELL Of the total number, you mean?

DR. GOIN That is the congenitally short leg, the club foot, the withered arm, the congenitally dislocated hip, the absence of a half vertebra and the consequent crooked back. How, I ask, would medical care have restored these unfortunates to usefulness? 280,000 were rejected for syphilis Treatment for syphilis is offered freely everywhere. As a matter of fact our statute books are simply loaded about syphilis prevention I doubt that there is a community in which a syphilitic person may not receive treatment from a department of public health One wonders how compulsory health insurance would have eliminated this group 220,000 were rejected for hernia, probably for hernias so severe that the Army was unwilling to attempt repair I mean by that that likely these were bad hernias because I did think the army repaired some. Hernia is the result of a congenital defect in the inguinal or femoral canal, presumably due to a defect in the germ plasm. If such a defect exists, its bearer is likely to have a hernia, and medical care has nothing whatever to do with the occurrence of hernia. 160,000 were rejected for "eyes," by which I suppose is meant defective vision Now it is true that some forms of blindness (ophthalmia neonatorum, for example) may be prevented by adequate medical care, and I think every state has a law requiring the instillation of silver into the eyes of the newborn, and it is my belief that opthalmia neonatorum is practically an extinct disease, but I think it fair to assume that this group of 160,000 did not include the blind but those with visual errors too great to permit good or even fair vision. If one is born with an eyeball too long or too short or one that is not symmetrical, then one will have a refractive error and one will either wear glasses or not see very well, and medical care again has nothing at all to do with it These groups total about 1,000,000, and the rejections which might be due to a lack of medical care are thus reduced to about 1 500,000, or about one third of the shocking figure of 5,000,000 Although it is quite problematic whether any program of medical care would have altered substantially this figure, we many rest on it, confident that the figures fall a good bit short of establishing an urgent need for the enactment of compulsory health insurance.

2 Even if we had had thoroughly established the need for some better plan for medical care, it would be proper to inquire whether a proposed plan offered some reasonable probability of improving public health Since compulsory health insurance has existed in various parts of the world for fairly long periods, it should be possible to examine the experience in those areas and, by analogy, establish the probable effect of our plans on our own health I think it quite interesting to note that compulsory health insurance has been in effect in San Francisco for some years as regards the municipal employees The insured are served by the same physicians and in the same hospitals as are noninsured persons In spite of the fact that no financial barrier exists between an insured person and a physician, the incidence of ruptured appendix is higher among the insured than among the uninsured In this instance, at least, the removal of the financial barrier, so abhorred of the social planner, did not seem to benefit the insured public The morbidity and mortality rates are higher in nearly all insurance countries than in our own May I quote to you from Dr Nathan Sinai's book "The War of Health Insurance" Remember that he is a most able and ardent advocate of compulsory Health Insurance He says that, 'Contrary to all predictions, the most startling thing about the vital statistics of insurance countries is the steady and fairly rapid rate of increase in the number of days the average person is sick annually and the continuously increasing duration of such sickness Various studies in the United States [he says] seem to show that the average recorded sickness per individual is from seven to nine days per year It is nearly twice that amount among the insured population of Great Britain and Germany and has practically doubled in both countries since the installation of insurance."

SENATOR DONNELL Might I ask a question? What is the approximate date of Dr Sinai's book, if you know?

DR. GOIN I would say roughly 1943 or 1944, maybe it is 1942 This seems to me a rather sound argument against compulsory health insurance, although Dr Sinai probably did not intend it thus To clinch the matter, he adds "It seems to be a safe conclusion that insurance has certainly not reduced the amount of sickness" This puzzles me a little, since I have naively assumed that the intent was to reduce the amount of sickness and to improve health I believe that the evidence in hand warrants the flat statement that compulsory health insurance will not benefit the public health

3 When compulsory health insurance was proposed in California a year ago last January, no one appeared with any sound idea as to its cost The guesses varied between $20 per person per year and $80 per person per year Most thought that $40 was a fair figure I think it significant that costs are nowhere discussed in the present bill, the Surgeon General of the Public Health Service being given a blank check. At $40 per person per year the program would cost 4,000 million dollars, and no one really knows whether this amount would suffice Experience elsewhere indicates that there is needed at least one employe (not including those actually delivering medical service) for each hundred insured persons (Crownhard, J G Sickness Insurance in Europe, 1938, p 25) On this basis we would need to increase the government payroll by about 1.5 million employees And yet, to pay this vast army, to pay the doctors, to pay for hospitalization and for the other benefits offered, no sums are named, no appropriations are made and no limits are set. This is a rich country, but no wealth is unlimited.

4 A sort of current custom is to use the terms "medical care" and "health" as if they were interchangeable—as though one were a synonym of the other As a matter of fact, medical care is only a small part of the health problem—not even the most important part Health consists largely in not being sick, medical care consists largely in an attempt to cure or alleviate disease. Nearly all—perhaps all—of the health legislation which has been proposed from time to time has been written by social planners, seldom, if ever, in consultation with physicians Consequently nearly all of it contains much wishful thinking and not too much reality Too much confidence is placed in preventive medicine, too much earnest belief that periodic health examinations will prevent disease, and all the legislation evidences a complete failure to understand that preventive medicine simply has not yet attained the goals wished for To cite a few of the problems How shall heart disease (except that due to rheumatic fever) be prevented? What sort of health examination will be efficient in its control? How shall we prevent, or even recognize, early brain tumors? Shall every one with a headache have encephalographic or ventriculographic studies? Shall we do gastrointestinal x ray studies on every one with indigestion and, if so, where shall we obtain the skilled personnel? How are bone tumors prevented, and what periodic examination makes one aware of the pneumonia of next week? Medical care is, and will for a long time continue to be, the care of the sick, and this I repeat is only a fraction of the health problem. Some other fractions to which government might well turn its attention are sanitation, hygiene, health education, adequate diet, good housing adequate clothing, working conditions and "patent medicine control And there are many others If government is sincerely interested in the health of the citizen why should it not suppress "patent medicine" advertising? Why should it not regulate the cults and require that all who wish to practice the healing arts pass the same tests? Why should it not control radio publicity of nostrums, vitamins and the like? This current legislation is attacking only a small segment of the health problem, and even if it were to accomplish all that its proponents claim it still would not solve our health problems

5 Voluntary health plans will, if given the opportunity do the job, and do it better than government controlled plans can do These plans, which already include a very large number of persons, are in accord with our traditional emphasis on personal responsibility, prudence, foresight and thrift They have an American dignity which is lacking in the regimentation of compulsory health insurance They can be and are more

economically administered they can and do give better medical care, and they will be and are supported by thousands of physicians who are bitterly and unalterably opposed to government controlled medicine In California we have made a good start. Our California Physicians Service offers medical care at modest costs A quarter of a million of our people have availed themselves of it, and appear to be quite satisfied with it The Farm Security Administration had a medical care program for the rural indigent California Physicians Service took it over and gave better medical care for less money and to the satisfaction of those giving and receiving the care California Physicians Service has just signed a contract with the State Grange providing medical care for nearly 100,000 farm people. These activities, which are duplicated in most of our states are indications of how voluntary plans can meet the challenge—how they are meeting it, and how they will continue to do so with a steady and healthy growth if they are not crushed by the monster of bureaucratic control

SENATOR MURRAY Doctor, is it not true that most of the objections that are made to the compulsory system with reference to the relationship between physician and patient apply equally to the voluntary systems? DR GOIN Senator, I am really familiar only with the California voluntary system and in that instance I will answer "No it is not true '

SENATOR MURRAY Will you explain the California system again briefly? DR. GOIN That is a voluntary health care plan in which people are enrolled as beneficiary members and are served by doctors who are professional members The doctors are paid on what is called a unit basis that is to say that the funds received in a given month are pooled and after the necessary administrative expense and a reserve for unforeseen contingencies such as an unexpected epidemic next month are set aside the remaining money is divided equally among the doctors on the basis of what service they have rendered The minimum amount of medical service is presumed to be a visit to the doctor in his office one office call That is known as one unit. The fee schedule is then in multiples of that unit. There is no one that intervenes at all between the doctor and his patient There are practically no regulations none that I know of that concern the practice of medicine

SENATOR MURRAY Does your system give full coverage to the people that belong to it? DR. GOIN Not quite Senator

SENATOR MURRAY What do they cover? DR. GOIN We have three types of contract that we offer We offer the so-called catastrophic coverage in which the insured is covered for hospitalization and surgery including fractures and dislocations

SENATOR MURRAY That is only in cases of a catastrophe? DR GOIN It is a case requiring any sort of surgery plus fractures and dislocations which are considered to be surgery they are specifically included. Then we have the same contract with the so-called medical rider, in which the patient receives medical care if he is hospitalized and then we offer a third contract known as the two visit deductible' in which the patient, the subscriber, is fully covered except that he must pay for the first two visits to the doctor However if the first two visits lead to hospitalization and surgery he is not obliged to pay for them The purpose of the two visit deductible is to prevent the insured from imposing on the professional member

SENATOR MURRAY All three of the systems would not cover all the service that is proposed under the pending bill DR GOIN All except the first two visits to the doctor, Senator

SENATOR MURRAY You do not provide for maternity care do you? DR. GOIN Yes sir after ten months The subscriber must be a subscriber for ten months before she is eligible, but thereafter she is completely eligible.

SENATOR MURRAY Do you provide dental care? DR. GOIN No sir

SENATOR MURRAY And no nursing care? DR. GOIN The ordinary floor nursing in the hospital no home nursing

SENATOR MURRAY And no eye care? DR. GOIN What do you mean by that?

SENATOR MURRAY Medical treatment of the eyes DR. GOIN We do not prescribe glasses but any eye disease is just as amenable to treatment as any other disease

SENATOR MURRAY You take the position that the compulsory system would result in a deterioration of the medical service of the medical profession in the country? DR. GOIN I am persuaded of it

SENATOR MURRAY Is it not true that at one time the American medical profession considered favorably compulsory—

DR GOIN That is true I think we are all entitled to one mistake

SENATOR MURRAY That was a serious mistake made by very excellent men DR GOIN That is right but since that time we have developed a good deal of experience.

SENATOR MURRAY But for a long time you were also opposed to a voluntary system DR GOIN I could not say that is true I think the American Medical Association did not regard voluntary care plans with much favor for some time, largely because there had been no experience developed and no one knew how to do these things or whether they could be done I think the doctors are rather complete realists We face conditions as they are If we have an incurable patient, for example, we do not hope to cure the patient we hope to make him as comfortable as possible until death intervenes They thus learn to be realistic To want to do something and to do it are not synonymous terms and I think for a long time we doubted whether there was enough experience in the world to justify any type of health insurance I think slowly it is developing that there is an increasing amount of experience which does justify it and therefore we have reversed our attitude and we now support these matters

SENATOR MURRAY Without some system of insurance, or some means of making modern medical care available to a large section of the people of this country they would go without adequate care DR GOIN No I could not agree to that, sir

SENATOR MURRAY You do not accept that at all? DR. GOIN No I do not.

SENATOR MURRAY You think that the American people can get all the medical care they need? DR. GOIN I heard Senator Pepper this morning describe the lack of medical care in his home state Of course, I have no way to know what occurs in Senator Pepper's home state. But I can say this that I have been in the practice of medicine for thirty-four years and that during that time I have never refused any person any medical care that I thought I was competent to give, nor do I know any of my fellows that have done so Now perhaps there are people who have done otherwise

SENATOR MURRAY You think that the present system then of having the medical profession wherever they find patients coming to them that are unable to pay, that they should accept those patients and care for them? DR. GOIN I certainly do I think it is not only their duty I think it is their privilege to do so

SENATOR MURRAY And you think that that would be the result in this country if we did not have any compulsory system? DR. GOIN No sir I do not wish to be misunderstood I do not argue for the maintenance of the status quo I think we must find some better way to distribute medical care. I am not yet sure what that better way is My preference for the moment is for voluntary health care plans but I think it is also true that one need not be sure of the right answer to know when the wrong answer is wrong

SENATOR MURRAY Of course there are a great many members of the profession and even members of the American Medical Association who disagree with you in these views DR GOIN Well a great many in that a few thousand are a great many But I think 95 per cent of the physicians of America would agree with my views

SENATOR MURRAY I have here a release just issued by the Committee for the Nation's Health which I will ask to have inserted in the record

I will read it

DISTINGUISHED PHYSICIANS SUPPORT HEALTH BILL

A distinguished group of physicians all members of the American Medical Association in a telegram to Dr Channing Frothingham chairman of the Committee for the Nation s Health took sharp exception to the AMA stand on the Wagner Murray Dingell national health bill now under consideration by the Senate Committee on Education and Labor

We believe from available experience the telegram reads that voluntary health insurance plans will be too costly to give satisfactory medical services for the urgent needs of the American people.

Therefore, we favor a National Health Program financed by compulsory insurance and delivered by decentralized administration with utilization also of voluntary medical care plans meeting approved standards.

Free choice of physician by patient and complete professional freedom for the doctors must be insisted on.

The list of physicians signing the telegram includes doctors in private practice throughout the United States, medical school teachers research scientists clinicians Among the group is a winner of the Nobel prize Dr George R Minot of Boston Dr Thomas Addis of San Francisco well known medical professor at Stanford University Medical School

Dr George W McCoy of New Orleans nationally known for his work on the control of infectious diseases Dr Edward A Park of Baltimore, professor of pediatrics Johns Hopkins University The list of signers follows

Channing Frothingham M D Boston
Harold Aaron M D New York
Thomas Addis, M D San Francisco
B T Beasley M D Atlanta
Walter Bauer M D Boston
Herrman L Blumgart M D, Boston
George I Blumstein M D Philadelphia
Ernst P Boas M D New York
Byron D Bowen M D Buffalo
Walter P Bowers M D Clinton Mass.
Allan M Butler M D, Boston
George Cannon M D, New York
Robert A Clark M D Pittsburgh
Joseph Dalven M D Brooklyn
Francis P Denny M D Brookline Mass
Robert L DeNormandie M D Boston
Edward T Ducey M D Muskegon Mich
Lewis A Eldridge Jr, M D, Great Neck N Y
Jacob Fine M D Boston
Charles A Flood M D New York
James L Gamble M D, Boston
Edwin T Gildea M D St Louis
Franz Goldmann M D Hamden Conn
Emmett Holt Jr M D New York
Thomas S Harvey, M D Edgewood Md
Henry C Knowlton M D Bangor Maine
Edward B Krumbhaar M D, Philadelphia
William S Ladd M D New York
John V Lawrence M D St Louis
P J Lipsett M D Oakland Calif
John S Lockwood M D New Haven Conn
T D W Lukens M D Philadelphia
Harry Mackler M D Elizabeth, N J
Leo Mayer, M D, New York
George W McCoy, M D, New Orleans
Hugh McCulloch M D St Louis
Irvine McQuarrie M D Minneapolis
James H Means M D Boston
T Grier Miller, M D, Philadelphia
George R Minot M D, Boston
Robert B Osgood M D, Boston

Richard T Thompson M D Denver
Borden S Veeder M D St Louis
L C Newton Wayland M D Santa Barbara Calif
Myron Wegman M D New York
William C Williams M D Rutherford N J
Edward L Young M D Boston

So there are a great many doctors around the country that are giving study to this problem and are of the opinion that a compulsory health system would be advisable in this country DR GOIN Senator, might I remark that it is not at all established that these men have given study to this problem? Perhaps they are well wishers who would like to see good done to humanity It, I think, would be very interesting to know how many of the telegrams Dr Frothingham sent out did not get affirmative answers I spent Sunday with a man in New York who is a professor of pediatrics at Columbia who refused to send such a telegram His name is not there I do not think it is a very large number compared to the number of doctors, and if it please the committee I could within ten days get a similar telegram signed by one thousand names for each name on there.

SENATOR MURRAY I am not disputing that I am merely pointing out that these men who are on that list are men of prominent standing and distinction in the country DR GOIN That is true.

SENATOR MURRAY And that they are giving study to the problem and are of the opinion that a compulsory health system is advisable DR GOIN That is right. Some of them have devoted their lives to getting a compulsory health system activity Peters, Addis and Butler, for instance, devoted almost their entire lives to getting such a system I presume they are sincere.

SENATOR MURRAY When did these doctors commence to promote such a program? DR. GOIN I know Addis, to my personal knowledge, has been advocating it for sixteen years

SENATOR MURRAY And the American Medical Association generally opposes it? DR. GOIN That is right

SENATOR MURRAY I notice that in this report of "Medical Care for the American People," which was issued in 1932, a committee on the costs of medical care, that the American Medical group at that time was opposed to the voluntary system That is true, is it not? DR GOIN I could not say, but I would not be at all surprised, because as I said before at that time we had no body of facts on which to proceed on a voluntary health care plan, and they had to be worked out piecemeal, slowly, painfully and frequently expensively

SENATOR MURRAY I had reference here to the minority report at that time signed by— DR GOIN The signers of the minority report do not represent the American Medical Association It represents eight doctors, members of this committee.

SENATOR MURRAY The members who were on that committee at that time? DR GOIN Well, they were just doctors who were on the committee I do not know if they are even members of the American Medical Association They were certainly not there in that capacity

SENATOR MURRAY They consist of A C Christie, George T Tollansbee, M L Harris, Kirby S Cowlett, Arthur C Morton, N B Van Etten, Robert Wilson, Alphonse M Schwitalla and Olin West DR GOIN Schwitalla, for instance, is a Jesuit priest, not a doctor at all

SENATOR MURRAY He is a professor at St. Louis University DR GOIN He is dean of the St Louis Medical University and is a priest, not a physician

SENATOR MURRAY I understand that He is a student of these problems DR GOIN But not a member of the American Medical Association

SENATOR DONNELL If I may interrupt, I call attention to page 151 of the volume from which the chairman is reading at which Dr Schwitalla is described as "A M Schwitalla, Ph D" I think the other gentlemen are mentioned as "M D" but he is referred to as "Ph D"

SENATOR MURRAY After this meeting of the committee that was set up at that time, these medical men who signed this report opposed the voluntary system and advocated the compulsory system Is that right? DR GOIN I could not answer I do not know I am not familiar with it

SENATOR MURRAY I will read it

DR GOIN I think it would be of little significance since it is nearly sixteen years since the report was written A great many things have happened

SENATOR MURRAY —

The Committee on the Costs of Medical Care has been in existence for five years and during that time has collected at considerable expense a great body of data Among these data are extensive comments on insurance medicine as it has developed and is now working out in various countries in Europe and also in this country In 1931 Simons and Sinai conducted a study of health insurance for the American Dental Association which the majority report of the committee summarizes on page 99 One of the statements in their summary is as follows Every attempt to apply the principles of voluntary insurance on a large scale has proved to be only a longer or shorter bridge to a compulsory system Every so-called voluntary system is successful in just about the proportion that it contains compulsory features Nothing has been made clearer than the fact that voluntary health insurance schemes have everywhere failed In Europe they have been replaced by compulsory systems which are now under trial Even in Denmark, where the system is nominally voluntary there are indirect but very effective means of compulsion

I understand that this report was submitted to the House of Delegates of the American Medical Association and that the House of Delegates approved this in 1933 Is that true? DR GOIN I could not say I was not a member of the House of Delegates at that time But I repeat that I think it has but little significance, since times have changed a great deal in the ensuing years That report was probably written about 1930

SENATOR DONNELL In 1931

DR GOIN In 1931 perhaps I think we are in a considerably different situation I should like to answer an objection that they raise, however, that the voluntary health insurance, all these plans, have always heretofore failed I think that is true too, but they must have been speaking of voluntary health insurance plans in Europe since we had none in this country at that time

I might call your attention to the fact that attempts at democracy also did fail in Europe, and had we been guided by their failures we would not have had a republic in this country, that no country, until we did so, wrote a truly democratic constitution such as we live under, that voluntary health insurance plans might have well been nourished by the rugged fertile democratic soil of America, whereas they would be like the wheat that was sown among the rocks in the parable, in Europe, where they have a working class they would almost

consider indigent, where they have a social economic culture derived from the feudal period, where conditions are so much different that I do not think there is any valid comparison I should think that if we could cover 71,000,000 people in America with life insurance on a voluntary basis, without any compulsion whatever, persuading these people to buy the insurance because they believe they need it, I see no reason to believe we could not cover 71,000,000 people with a voluntary insurance

SENATOR MURRAY We have been trying for a long while to spread health insurance in this country, but we have not succeeded. DR. GOIN Not very long, Senator

SENATOR MURRAY Do you think it would be possible in any length of time to get a complete coverage in the country under a voluntary system? DR GOIN I think the voluntary systems, if they were not handicapped by the fact that they are largely under the management of doctors and state medical societies having at their disposal extremely limited funds and having not much business experience, and being totally unable to afford the publicity that they should have, and the sales campaign that they should have, if we were freed from those restrictions, I think we could sell an enormous amount of voluntary health insurance in a short time

SENATOR MURRAY But these voluntary health systems do not give the people joining them full medical coverage. DR GOIN No, nor does the compulsory health insurance, although the bill says that it will But the fact is that it takes time to develop these things, Senator Murray, and one cannot just dash in and turn everything at first crack

SENATOR MURRAY What medical care or service do you mean to say that is not covered by the pending bill? DR. GOIN It is all covered by the bill But most of us have seen how it is actually applied and we are not too impressed

SENATOR MURRAY You mean to imply that it would never be carried out? DR. GOIN Well, it would be carried out in compliance with the letter of the law, but it would not be any good Twenty-five people walking through my office and saying they have a cough and having prescription 271 handed to them by me is not medical care in my mind

SENATOR MURRAY How would it be better under a voluntary system? DR. GOIN You do not have any interference, any regulations The doctor treats his patient as he sees fit If the patient does not like him, he goes somewhere else. Under our voluntary health plan in California any patient may select me if he likes, but if he does not like me there is nothing to compel him to come to me. He can go to my neighbor Hence he is likely to find the medical care he wants Nobody tells me what I must do to these patients

SENATOR MURRAY Under this bill nobody tells the doctor what he must do DR. GOIN Oh Senator, I could not quite agree with that.

SENATOR MURRAY That is what I consider your personal construction of the language. But it is not susceptible of that construction in my judgment The bill properly construed does not interfere or attempt to supervise the doctor in any respect. In fact, it specifically undertakes to point out that it does not interfere with the doctor or with the relations of the patient and doctor

(*Dr Goin gave some demonstrative cases from military practice*)

SENATOR MURRAY Do you not think the doctors in this country and the various clinics and laboratories, operated under a group practice system, do you not think they give excellent service to the American people? DR. GOIN I think it varies a good deal between various clinics, but in general I would think yes

SENATOR MURRAY The system of group practice in this country has to a large extent supplanted the former practice of individual doctors DR. GOIN I would not say so I think the individual doctors are by far in the majority

SENATOR MURRAY But the group practice system is growing in this country, and it is tending to— DR. GOIN Yes, sir

SENATOR MURRAY It is the modern method of medical care now recognized as the most efficient Is not that true DR. GOIN I would say it is an excellent way to practice.

SENATOR MURRAY Isn't it much better than the old system of a single practitioner attempting to take care of a patient? DR. GOIN I do not think a single practitioner does attempt to take care of a patient except in the most trifling incident. I do not think he has any hesitance to summon consultation He does not secure the approval of the administrative officer of the district either, but he does in this bill

SENATOR MURRAY How does that affect the service that he would render, even if he did contact the administrative officer? DR. GOIN Senator, I think the minute you interpose an administrative officer between the sick man and the consultant you begin to complicate the system

SENATOR MURRAY We have this system right here in the Senate of the United States I go to an administrative officer, Dr Calver, and he sends me out to the Naval Hospital I go out there and I am checked up by doctors that I never saw before and never heard of before They tell me what is the matter and recommend treatment DR. GOIN Would it be unfair for me to point out that you are a distinguished Senator from the United States and not a fellow who works down at the docks

SENATOR MURRAY If it is good enough for a distinguished Senator, it might be good enough for a person who works down on the docks DR GOIN That is true, but the reverse is not necessarily true

SENATOR MURRAY It seems to me that the system is good because it is effective and because it is the modern way of handling the sick DR GOIN Senator I cannot believe that you would compare the service that a Senator gets in a government hospital with the service that an ordinary plain day laborer might expect to get at the hands of panel doctors subject to the administrative officer's directives I cannot believe that

SENATOR MURRAY You mean to imply then that an ordinary person walking into one of these voluntary systems would not get complete and excellent care? DR GOIN Voluntary system?

SENATOR MURRAY Yes DR GOIN If he did not, he would go elsewhere.

SENATOR MURRAY You think it is only a United States Senator going through the Naval Hospital that can get the finest kind of care? Is that the idea? DR. GOIN No, sir What I say is that you probably get attention far surpassing that which might be expected to be received by an ordinary panel patient who is a laborer who goes to the panel doctor who is subject to the directive of the medical administrative officer of the district. I think there is no comparison whatever between the two situations and I think you will admit it

SENATOR MURRAY I do not understand the medical officer in the district having anything to do with the situation after the relationship of patient and doctor is made under this bill DR GOIN Section 205, paragraph (a) Senator, establishes it It says that the patient may have a specialist if his attending doctor requests it if it is approved by the administrative medical officer of the district.

SENATOR MURRAY What is wrong with that? DR GOIN I think a good deal is wrong with it I do not wish a medical administrative officer intervening between me and my desire to have a consultant if I am not satisfied with your medical attention

SENATOR MURRAY Line 15 page 46 is as follows

(d) The services of a specialist or consultant shall ordinarily be available only upon the advice of the general or family practitioner or of a specialist or consultant attending the individual The services of specialists and consultants shall also be available when requested by an individual entitled to specialist and consultant services as benefits and approved by a medical administrative officer appointed by the Surgeon General.

Isn't that a reasonable regulation? DR GOIN I would not think so sir

SENATOR MURRAY You would not? DR GOIN No Under voluntary health care plans he could have the service of a specialist on his own demand If he was sick and not satisfied with any doctor and wanted a specialist, I would feel I was entitled to get it on demand

SENATOR MURRAY It says The services of a specialist or consultant shall ordinarily be available only upon the general or family practitioner or of a specialist or consultant attending the individual' DR. GOIN But if the family practitioner does not think you need a specialist, the patient cannot have one In line 21 until the medical officer approved of it.' That, I think, is unwarranted interference between the doctor and patient

SENATOR MURRAY The various voluntary plans that have been called to my attention are all plans that do not give full medical care and hospital service. They all have some qualifications which prevent a person from getting the advantage of full modern medical care, and nine times out of ten they would be compelled to pay for the services that they would find themselves in need of DR GOIN Senator I can speak with authority only for the California physicians, in which, as I told you, I am president of the board of trustees, but speaking authoritatively for that service I would say that is not the case.

SENATOR MURRAY I merely wish to point out that the plans we have examined—voluntary plans—all have qualifications and exceptions which vary in the various sections of the country Your plan is a complete plan, affording complete medical care and hospitalization DR GOIN It is not quite a complete plan As I told you, we have three different types of contracts The best the most complete one, excludes the first two visits to the doctor We have thus far found it necessary to do so for this reason, that John Jones drinks a lot of gin on Saturday night and wakes up feeling pretty bad on Sunday morning If he has to pay to see the doctor he takes an aspirin and wishes he had not taken the gin Otherwise he sees the doctor, and that breaks the plan. Therefore we have been obliged to impose these two visits I do not think anybody would avoid a doctor if he had to pay two calls to the doctor, possibly not to exceed $10 anywhere, and not to exceed $5 or $6 in most places

SENATOR MURRAY On the other hand there are a great many people in this country, working people, employed in the various industries, and in mining and so forth, who have families and who are compelled to live on a modest income, and in such cases as that, even without having overindulged themselves, and without any cause on their own part, they become sick and oftentimes they neglect going to a doctor because they hesitate to incur the cost of such a visit We find that in the testimony we have received here continually for several years DR GOIN I would be inclined to agree with that, but I would also like to add that these same people have commonly spent much more than the cost of one or two visits to the doctor on "patent medicines," strange and irrational cults and advice from incompetent persons which has led to the expenditure of money Education is a part of this problem

SENATOR MURRAY That is right And that is exactly what this bill is seeking to avoid, the people who sell these 'patent medicines" are contributing to the funds for the purpose of opposing this very program DR GOIN Possibly so I do not know about it.

SENATOR MURRAY I know about it, and in the drugstores throughout the country where you go in and buy this patent medicine," they slip in a little bit of propaganda into the package warning you against this bill that is pending here in the Senate of the United States DR GOIN I am very glad to hear that I am much encouraged

SENATOR MURRAY You would like to encourage that DR GOIN Yes

SENATOR MURRAY You would like to continue the system in this country, then of the sale of 'patent medicine," and quack remedies DR GOIN No, sir I would like to continue the encouragement of the opposition of this piece of legislation

SENATOR MURRAY You are perfectly willing to contribute to any methods that would defeat this bill DR GOIN Perhaps not any I do not believe it has been shown that the 'patent medicine' interests are tied in to opposition of this bill Perhaps it is I am not aware of it But I certainly endorse the distribution of the propaganda by the druggists

SENATOR MURRAY Are you familiar with the National Physicians Committee of Chicago? DR. GOIN Not particularly

SENATOR MURRAY *You have heard of it? DR. GOIN Yes,* I have even contributed to it

SENATOR MURRAY You have And they have sent out a lot of false and malicious propaganda in the country against this bill, calling it political medicine and socialized medicine. Is that true? DR GOIN I think we would have to define our terms, Senator Your "false and malicious" might be different from mine

SENATOR MURRAY When they totally misrepresent the provisions of the bill do you think that is malicious? DR GOIN I have not seen it done

SENATOR MURRAY I have seen it. They circulated their propaganda and it has been distributed all over the United States DR GOIN As Dr Sensenich said this morning if it is propaganda you do not agree with the purpose of it It is only missionary work if you do

SENATOR MURRAY You think this propaganda should not be objected to? DR GOIN I do not object to it

SENATOR MURRAY You are perfectly satisfied with the propaganda issued by the Physicians Committee of Chicago DR. GOIN All that I have seen has satisfied me

SENATOR MURRAY Of course there are a lot of people that feel that way about it DR GOIN I dare say

SENATOR MURRAY I must admit that you are within your rights in wanting to support that kind of a procedure to prevent legislation of this kind. DR GOIN I think so

SENATOR MURRAY I have here a note to the effect that the British Medical Association has made a statement approving the medical plan, the medical health insurance system they have in Great Britain, and are making proposals now for the extension of its service They say in their statement "Despite its defects, this service has been an undoubted success" That is the statement issued by the General Medical Service of the nation, April 1938, by the British Medical Association

SENATOR DONAHEY What is the date of that, Senator? SENATOR MURRAY April 1938

DR GOIN My understanding is that they are bitterly opposing the extension of the National Medical Service plan now proposed

SENATOR MURRAY The information that I am receiving is that they are in favor of it. DR. GOIN I saw an article in *Time* of just one or two weeks ago, perhaps, in which all the evils and dangers were pointed out at great length, and the British quoted, perhaps, unfairly I think it is important to notice what is back of that in Great Britain, which is very obviously for the benefit of public health, as it repeals compulsory vaccination I think that is a most remarkable point of sincerity The enactment of the British service to hospitalize also contains a provision that abolished vaccination

SENATOR DONAHEY Dr Goin, Senator Murray offered into the record a release issued today at the head of which is the expression, or statement, Committee For the Nation's Health, 402 Sixth Street N.W., Washington, D C" That statement sets forth a copy of, or excerpts from, I am not certain which, a telegram from certain gentlemen addressed to Dr Frothingham Had you ever seen that telegram before? DR GOIN Yes Dr Frothingham sent out a telegram last Wednesday or Thursday, I think it was, to a selected group of people asking them to sign this telegram The way I happened to see it was that a friend of mine received it and asked me my advice

SENATOR DONAHEY And the language of the telegram was set forth in the request, was it not? DR. GOIN No, it was not Just a telegram endorsing this legislation

SENATOR DONAHEY Did the telegram which you say mention specifically S 1606? DR GOIN Yes, sir

SENATOR DONAHEY I note with interest the fact that the quotation from this telegram which was offered into evidence this afternoon does not mention S 1606 at all It reads as follows

> We believe from available experience [the telegram reads] that voluntary health insurance plans will be too costly to give satisfactory medical services for the urgent needs of the American people
>
> Therefore we favor a national health program financed by compulsory insurance and delivered by decentralized administration with utilization also of voluntary medical care plans meeting approved standards.
>
> Free choice of physician by patient and complete professional freedom for the doctors must be insisted on

I call your attention, Doctor, to several facts about that telegram which I think are of considerable interest. In the first place, as indicated there is no mention whatsoever of this particular bill, S 1606 You observed that as I read it. DR. GOIN Yes

SENATOR DONAHEY In addition to that, I want to ask you about this I am unable to determine whether this telegram is intended as an endorsement impliedly, without mentioning it, of this bill, or whether it is a very careful attempt to express an opinion favorably for the general idea of compulsory insurance, but with certain safeguards which the signers of the telegram specifically wanted to have incorporated before they would approve it.

I call your attention to this, and I want to ask you your opinion on it

It says, as I have indicated, "Therefore, we favor a national health program financed by compulsory insurance and delivered by decentralized administration with utilization also of voluntary medical care plans meeting approved standards"

I will ask you to state, Doctor, from your study of S 1606, whether you consider the plan set forth in S 1606 as a "decentralized administration' of compulsory insurance? DR. GOIN No sir, highly centralized

SENATOR DONAHEY Highly centralized into the Surgeon General and the Social Security Board, here in Washington DR GOIN That is correct

SENATOR DONAHEY An advisory council composed of people from various parts of the United States, but as the name implies only an advisory council Is that right? DR GOIN I do not think an advisory council needs to be considered much

SENATOR DONAHEY In other words, the council may render valuable advice, but, after all, the ultimate decision as indicated in S 1606, rests in some instances in the Surgeon General, in other instances in the federal Social Security administrator the head of the entire system That is right, is it not? DR GOIN Yes

SENATOR DONNELL So you would not regard this bill, S 1606, as conforming to this requirement of this telegram, that the program be delivered by decentralized administration DR GOIN No I would not

SENATOR DONNELL It also, I think, gives quite an implied compliment to the voluntary medical care plans which have been instituted It states after the language "we favor a national health program financed by compulsory insurance and delivered by decentralized administration' it states 'with utilization also of voluntary medical care plans meeting approved standards" Would you understand that to mean, Doctor, the plans adopted by voluntary associations such as the California and other associations over the country? DR. GOIN I would not understand it at all I do not see what is meant by that.

SENATOR DONNELL It is susceptible of the construction however, that they are referring back—the signers of this telegram—to some voluntary medical care plans that somebody has previously instituted DR GOIN It could be So-called friendly societies were incorporated in the British plan

SENATOR DONNELL The point I am making is that there is in this telegram first, no specific approval of S 1606 second a qualification as I read it that the program should be delivered by decentralized administration, which you do not think is created by S 1606 DR. GOIN No I do not.

SENATOR DONNELL And in the third place, that the telegram distinctly refers to a favoring utilization of voluntary medical care plans Now, in the next plan I observe this which I want to ask you about The telegram said 'free choice of physician by patient and complete professional freedom for the doctors must be insisted on" Do you think, Doctor, that under S 1606 free choice of physician by patient exists? DR GOIN No, sir

SENATOR DONNELL Do you think that complete professional freedom for the doctors is assured? DR GOIN No, sir

SENATOR DONNELL For instance, the right of the Surgeon General to designate who shall be considered as specialists under the terms of section 205 and the right of the Surgeon General to designate who shall be considered consultants that is a restriction, is it not, on the absolute freedom of physicians? DR GOIN Certainly

SENATOR DONNELL So the telegram, as I have indicated therefore, has these various features which I think should be added in the record as supplementing the language of the telegram Now further, about this telegram Who is Dr Frothingham? DR GOIN Superintendent of the Massachusetts General Hospital in Boston

SENATOR DONNELL Of the Massachusetts General Hospital in Boston? DR GOIN Yes

SENATOR DONNELL Has Dr Frothingham been active, do you know, along the lines of compulsory insurance for some time? DR GOIN It is my impression that he has, but I speak under correction I am not too positive.

SENATOR DONNELL Do you know of the meeting that was held at the Carleton Hotel in Washington D C., April 1 1946 either for the organization of or by the Committee for the Nation's Health? DR. GOIN No I do not

SENATOR DONNELL Did you ever hear of the Committee for the Nation's Health before the present time? DR GOIN Never

SENATOR DONNELL Do you know whether it is a long established committee or a recently established committee? DR GOIN I do not know but I would assume if it were of long existence I would know about it, and I do not.

SENATOR DONNELL Do you know a man by the name of Michael M Davis? DR GOIN By reputation

SENATOR DONNELL Do you know whether or not he had anything to do with the preparation of this telegram? DR GOIN No I do not.

SENATOR DONNELL Do you know Dr Ernest Boas? DR GOIN Not personally but by name

SENATOR DONNELL I note he is one of the signers of the telegram and I note from tomorrow's schedule that the doctor is to appear here under the designation of Chairman, Physician's Forum Inc. That is an organization as I understand from previous testimony consisting of about 2 000 doctors Is that correct? DR. GOIN No I do not know I know it is a group of physicians in favor of compulsory health insurance and many leftist trends

SENATOR DONNELL You know it to be a small organization? DR. GOIN Yes sir

SENATOR DONNELL It is not at all the size of the American Medical Association, is it? DR. GOIN No Goodness no

SENATOR DONNELL Doctor I should like to ask you also whether you know of an organization with offices at the same address at which appears the Committee for the Nation's Health entitled "Committee on Research and Medical Economics" DR GOIN Never heard of it.

SENATOR DONNELL Did you ever hear of Fred Stein? DR GOIN No

SENATOR DONNELL Or Paul Kellogg? DR. GOIN No

SENATOR DONNELL Do you know whether Dr Frothingham is a member of such a committee as that? DR GOIN No

SENATOR DONNELL Then I will not pursue that inquiry further, save to say Mr Chairman that I propose a little later on to present certain evidence with respect to the meeting at the Carleton Hotel on April 1, 1946 Now Dr Goin, in your testimony, near the outset of it, you referred to the occasion of the complexity of the problem, and you illustrated that by the fact that while title II of S 1606, that is to say the compulsory insurance portion of the bill, contains seventeen sections the German insurance law had before the war grown to more than 3 300 sections DR GOIN That is right

SENATOR DONNELL Now just as indicative Doctor of the fact first, that it is not solely because of the prolificacy of the German language that it has grown to that extent. DR. GOIN I think the same thing is true in Great Britain.

SENATOR DONNELL Now, I hand you this book and ask you if you can estimate the weight of this book by taking it in your hand DR. GOIN A couple of pounds, I guess

SENATOR DONNELL Will you look in there and tell us the number of pages and the title of that book? DR. GOIN It has 1,281 printed pages and two or three numbered ones for notes

SENATOR DONNELL What is the title of it? DR GOIN The National Health Insurance Act of 1936 to 1938 with Explanatory Notes Cases Decisions of the Minister of Health and Statutory Rules and Orders"

SENATOR DONNELL By whom issued? DR GOIN By Henry Lesser, Bachelor of Laws London, Gray's Inn, Barrister at Law with a Foreword by Elliot, M D M P Minister of Health, and published by the Africa House Kingsway London, 1939

SENATOR DONNELL Mr Chairman I would say it is reassuring to say that lawyers had to assist in getting out this book. At any rate, this book is entitled 'The Law of National Health Insurance' and the frontispiece has indicated what it is as to its contents DR. GOIN Yes

SENATOR DONNELL I hand you another book which consists of some 360 pages, exclusive of the index, and ask you to state what that book is DR. GOIN I know about this book

SENATOR DONNELL What is this book? DR. GOIN This is the British Panel Doctor's Bible." He has to look at this before he can tell what is the matter with the patient or what to do with him

SENATOR DONNELL By whom is that issued? DR. GOIN Medical Insurance Practice' by R. W Harris and Leonard Shoeten Sack" and it seems to have been written by R W Harris and Leonard Shoeten Sack, both lawyers No the first one is an assistant administrator of health and the second one a barrister This is the fourth edition of 1937 It is issued by the British Medical Association It is addressed to the general practitioner"

SENATOR DONNELL That is the one you referred to in your testimony Now, let me read a little bit of the language here as indicative of the type of instruction that is given here. You say this is the Bible' DR GOIN That is what we call it

SENATOR DONNELL For instance, I call attention to page 173 This is headed '(3) Where the insured person asks for treatment as the private patient'

> The acceptance of a fee from an insured person not on your list who specifically asks for treatment as a private patient does not ask for breach of your terms of service but it is usually to be deprecated It may cause you considerable inconvenience if he afterwards denies that he made such request and applies for repayment as explained above. No doubt the nature of the dispute would be narrowed if you took a statement from him in writing before giving him treatment but even so you are not free from the possibility of the patient making troublesome with unfounded allegations later

Doctor is there anything about taking such statements by patients before you even endanger yourself of the possible risk of false allegations under our practice today? DR. GOIN Not thus far I would take it that that is the illustration of what is meant by the often repeated freedom of the physician' under the compulsory health insurance.

SENATOR DONNELL Doctor under the volume which the chairman read entitled Medical Care for the American People"

and issued in 1932, being the final report of the Committee on the Costs of Medical Care, together with a minority report, you will recall that the chairman read from the Minority Report certain references to the summary made by Messrs Simons and Sinai in 1931 Now I call your attention to what the chairman read, but what might be inadvertently overlooked, that the report which Messrs Simons and Sinai made was at the instance of the American Dental Association Did you observe that? DR. GOIN Yes

SENATOR DONNELL *Now, Doctor, let me ask you, it is* entirely possible, I am not sure about this, I have no doubt that the chairman is of the opinion that it is true, and it may be, that this report of Messrs Simons and Sinai was adopted by the American Medical Association Do you know if it was? DR. GOIN No, I do not know

SENATOR DONNELL Now, the findings in the report are set forth on pages 99 and following I will read a few words 'A M Simons and Nathan Simons conducted in 1931 a study of the professional and economic problems of health insurance for the American Dental Association Their principal findings were' and then, No 5, "Every attempt to apply the principles of voluntary insurance on a large scale has proved to be only a longer or shorter bridge to a compulsory system Every so called voluntary system is successful in just about the proportion that it contains compulsory features" That is the language to which the chairman referred this afternoon I understood you to say, Doctor, earlier in your testimony that you are not arguing for the maintenance of the status quo DR. GOIN That is right.

SENATOR DONNELL And you agree there may have been mistakes made in the past. DR GOIN That is right

SENATOR DONNELL And mistakes in the future? DR GOIN Almost certainly

SENATOR DONNELL But that the American Medical Association am I correct in this understanding of your testimony, in your judgment, whether you have given it or not, am I correct in your view that the American Medical Association is making an honest and conscientious and diligent effort to solve the health *problems of the nation at this time?* DR. GOIN *There is no* doubt that that is true.

SENATOR DONNELL Would you concur with the view of any one who testified as did one witness yesterday, that the opposition to S 1606, at least as far as it refers to the American Medical Association, which was not mentioned by the witness, would you concur in the view however as applied to the American Medical Association that its opposition to S 1606 is inspired by dishonest motives? DR. GOIN I cannot understand what dishonest motives there would be to inspire it

SENATOR DONNELL Do you think it is inspired by any dishonest motives? DR. GOIN I certainly do not

SENATOR DONNELL Doctor, you have practiced medicine a good many years DR GOIN Yes, I have

SENATOR DONNELL Leaving aside the considerations of professional modesty, what has been your general observation of the type and character of the members of the medical profession as an entirety, as to whether they are honorable, upright generous and charitable men? DR GOIN I would say that the medical profession, like the legal profession and the clergy, and any other profession has always some rascals within it, but by and large I would think that the character of the men engaged in the practice of medicine is rather of a superiority

SENATOR DONNELL You think that the American Medical Association is representative of the highest ideals and of the highest membership of the medical profession in this country? DR. GOIN I do not think there is the slightest doubt of it

SENATOR DONNELL It composes about what percentage of the actual practicing membership of the profession in this country? DR. GOIN *That is a difficult thing to answer, but* I would guess five sixths about 170 000 doctors and about 120,000 members of the Association. It is generally estimated that from 20 000 to 25 000 doctors do not practice either because of prolonged bad health other occupations or because they have retired or other reasons

SENATOR DONNELL At one point in your testimony when your attention was called by the chairman to the fact that certain gentlemen it may have been the signers of this telegram, possibly others I do not recall did not agree with you, I think you said that as to that portion of your testimony you thought 95 per cent of the doctors would agree with you Is that a correct statement? DR. GOIN I do think so

SENATOR DONNELL And generally speaking Doctor, without going down into the minutiae of your testimony generally speaking as to the principles of your testimony here today is it your judgment that the great majority of the medical profession of this country would concur with the views you have expressed? DR GOIN I am absolutely certain of it. Last February, that is, February 1945, I debated with a doctor who was in favor of compulsory health insurance then pending in California I made the statement in debate that I thought that 90 per cent of the doctors of California would oppose this measure Without the slightest hesitation he said "I will make it 95 per cent," and he was the opponent

SENATOR DONNELL Doctor, you were referring to the costs *of this compulsory insurance, and I understood* your statement to be that it was impossible to determine what it is I want to call to your attention in that connection however, one fact that appeared to me was somewhat significant, and that is that you point out that experience elsewhere indicates that there is needed at least, one employee, not including those actually delivering medical service, for each hundred insured persons Is that correct? DR GOIN That is taken from a citation.

SENATOR DONNELL From Crownhart on "Sickness in Europe' That is a publication of 1938 DR GOIN Yes

SENATOR DONNELL You pointed out that on this basis it would need to increase the government payroll by about one and a half million employees DR. GOIN Yes

SENATOR DONNELL My recollection, Mr Chairman is that our esteemed colleague Mr Byrd has pointed out that there are 3 160,000 governmental employees at this time So that your judgment is, I take it, from what you state here, that, assuming the facts set forth by Mr Crownhart to be correct, the number of government employees would have to be increased by something over a third of what are now employed by the government DR GOIN That would seem to be the case.

SENATOR DONNELL Those, I understand from your statement do not include the doctors DR GOIN That is right.

SENATOR DONNELL What would these one million and a half people be? DR. GOIN They are the clerks and the administrative officers It is just thousands of employees it takes to administer such a complex thing all over the United States

SENATOR DONNELL You would have to have an employee in practically every city of any size in the United States, would you not? DR. GOIN If I remember correctly, and I probably do not, in prewar Germany the sickness insurance, not including accident insurance, which was administered by a separate institute, had a national institute, thirteen regional institutes and something like thirty-three thousand local offices, each of which obviously has to have at least one employee. In Berlin the main institute is an enormous building comparable to our buildings here in Washington. It must be staffed with thousands of employees

SENATOR DONNELL Roughly speaking are you able to give us an estimate of what grade of salary this million and a half people other than doctors, would receive? Is $2 000 a year too high for the average? DR GOIN I doubt if it is high enough.

SENATOR DONNELL Say we take $2,000 a year That would be three billion dollars a year just for the employees, other than doctors DR GOIN That is right.

SENATOR DONNELL Do you have any ideas as to how many doctors would be engaged in this plan? Are you able to estimate at all? DR. GOIN I hope a very small number, but I could not say

SENATOR DONNELL But if the plan became effective and reasonable opportunity was given for its success, undoubtedly there would be many thousands of doctors in it, would there not? DR GOIN I think it would take 150,000 doctors, or more, a good deal more to administer it

SENATOR DONNELL Do you think that it would take nearly all the time of nearly all of those men to administer their duties under this act? DR GOIN Goodness I should think so

SENATOR DONNELL What would you be able to estimate the average amount that those men would have to receive per person in order to compensate them adequately for their services? DR. GOIN There is a deep secret It was in California too when we had a long series of conferences with officers of the C I O, who insisted that they loved the medical profession and wanted to do well with them and thought they did not do well, ought to make more money and have more leisure for vacations, graduate study, research, if they guaranteed this bill But when we came down to brass tacks Mr Minsky, their research expert, thought $5 000 would be ample for any doctor Of course in England they only get about $2 per person per year, for insured persons

SENATOR DONNELL Would your judgment be that $5 000 is certainly not too high? It would be if anything considerably too low to compensate for the average professionally equipped man who has put in his time studying for a profession of that type and importance DR GOIN I would think so, although,

of course they get lower salaries than that in the Army and Navy and Public Health Service

SENATOR DONNELL Would you think $5 000 a year on the average, would be a fair estimate as to what they would have to have in order to live in reasonable respectability and commensurate with their position in life? DR GOIN I should guess so, because out of this $5 000 they have to maintain their office, assistance, telephone, automobile and supplies

SENATOR DONNELL That would look low to me but I take that figure as a very low figure That figure would be $750 000 000 a year for the doctors Now I should not be a bit surprised if it would be a good bit more than that would you? DR. GOIN No

SENATOR DONNELL If we take $750 000 000 a year and then take for the clerical employees and others that you have mentioned the one million and a half three billion dollars you get up to three billion seven hundred and fifty million dollars as the cost of operation of this system Now with that in mind Doctor— DR GOIN May I say that nearly all the experts think that much too low?

SENATOR DONNELL What do most of the experts think it would be? DR GOIN They think from four to four and a quarter billion dollars for the first year and the actuarial opinion is that the cost will not begin to level for at least fifty years, and it is very likely to reach ten or twelve billion dollars

*(Senator Donnell brought out through questions to Dr Goin the great costs of the measure and the difficulties of administration)*

SENATOR MURRAY Then is not this bill a safeguard? Under this bill the advisory committee of the local community assists in preparing the list of those who would be qualified as specialists and then you have the official recognition of this specialist, and the patient does not have to guess about it at all DR GOIN I do not want my penetrating ulcer to wait until somebody decides whether the fellow in the community is a surgeon or not I would rather have my abdomen opened and fixed before I die.

SENATOR MURRAY Of course you can find fault with any bill It seems to me that we are taking up a little bit too much time quibbling over these points involved in this legislation I do not think it serves any purpose that is of any benefit to us at all I do not think it accomplishes anything It seems to me that you have already stated clearly enough your opposition to the legislation You have stated your reasons why you are against it and I do not think that it is necessary to prolong the examination along this point Of course I am not going to stop you I am merely suggesting this to you

SENATOR DONNELL I appreciate the suggestion of the chairman I shall be as brief as I can I differ with the chairman as to the importance of this I regard this as extremely important

SENATOR MURRAY You are submitting leading questions to a witness who is biased in your favor and everybody knows of course, before he took the stand that he is utterly and unalterably opposed to this legislation We know that It seems to me that you have covered the whole situation with the testimony that you have already in the record

SENATOR DONNELL I will make it as brief as I can within what I think are reasonable limits Dr Goin in the situation to which I referred to which you referred in your testimony about the man who needs a consultant or a specialist under the present prevailing system in this country the individual patient or his family has the right at any rate, to determine whether or not he shall get the services if obtainable of a given doctor DR. GOIN Certainly

SENATOR DONNELL Whereas under the plan set forth in S 1606 it would be determined by the Surgeon General through his local representative down in the particular community as to whether or not the given doctor is qualified to act as a consultant or specialist DR. GOIN Well the sick person can have a consultant on recommendation of his general practitioner too

SENATOR DONNELL But no one can be paid as a specialist or consultant under the terms of subdivision (c) of section 205 unless he has been designated by the Surgeon General That is correct is it not? DR GOIN Yes

SENATOR DONNELL I want to make one or two other points quite briefly One of them is the point that I think is the point that easily arises in one's mind and that is the possibility of political situations arising That is to say suppose that there be an administration here in Washington that has a great army of employees 33 000 like they have in Great Britain or 66 000 or 75,000 or whatever it may be or 1 500 000 as this estimate is in your testimony Those 1 500,000 people are scattered all over the United States carrying on these very important functions There certainly would be the opportunity would there not Doctor for favoritism and political administration to enter into the determination by the local representative of the Surgeon General in Las Vegas N M for illustration, as to whether John Smith is or is not a specialist or consultant. That opportunity would exist is that right? DR. GOIN Humanity is pretty weak Senator

SENATOR DONNELL Yes and the political danger is one that should be borne in mind DR GOIN Yes I think it is a very great danger

SENATOR DONNELL I want to express this and I think it is highly important Some one handed this to me Not only do the costs include these 150 000 physicians et cetera but this plan involves hospitalization nursing dentistry possibly other benefits I do not recall if there are others or not So that the figures of 4¼ billion would certainly seem to be very conservative and perhaps billions of dollars under the actual cost Am I correct in your judgment on that? DR GOIN I honestly believe that they are very conservative

SENATOR DONNELL Now Doctor, there is one other question In regard to the point that you mentioned about the voluntary societies having the right to require that the first two visits of the doctor should be paid for at the expense of the patient DR GOIN That is provided in this bill too

SENATOR DONNELL I was going to call attention to the fact that section 210(a) not only gives the Surgeon General the right after consultation with the advisory council and with the approval of the administrator to determine whether or not a fee should be paid with respect to the first or second visit but it reads this way

Sec 210(a) The Surgeon General may after consultation with the advisory council and with the approval of the administrator determine for any calendar year or part thereof that every individual entitled to general medical general dental or home nursing benefit may be required by the physician dentist or nurse furnishing such benefit to pay a fee with respect to the first service or with respect to each service in a period of sickness or course of treatment

As I understand it, Doctor, that gives the authority to the Surgeon General, after the consultation indicated and with the approval of the administrator of the Social Security System to say to a given individual that he will have to pay for all the services rendered to him DR. GOIN There is no question about it at all in the language of the act.

SENATOR DONNELL So that what we have understood was a compulsory insurance system under which all of us would get this equality of opportunity if the Surgeon General decides against it would be resolved into a situation where we would have to pay even though we paid our taxes Is that correct? DR GOIN That is right

SENATOR MURRAY I might call attention there that in the bill, in section 210(a) you will find commencing on line 12 the following language

Such determination shall be made only after good and sufficient evidence indicates that such determination is necessary and desirable to prevent or reduce abuses of entitlement to any such benefit and shall fix the maximum size of such fee at an amount estimated to be sufficient to prevent or reduce abuses and not such as to interpose a substantial financial restraint against proper and needed receipt of medical dental or home nursing benefit.

Of course it is very proper that such provision should be in there, just for the very same reason that the doctor explained a few moments ago why they have the provision requiring payment for the first visit which may be waived if it is found that the person is really entitled to some real hospital care DR GOIN It is waived as a matter of fact No option about it.

SENATOR MURRAY So that this provision if we do have compulsory health service is a wise precaution is it not? DR GOIN Yes but it somewhat lessens the comparative spread of benefits between compulsory and voluntary health insurance plans because the proponents of compulsory health insurance complain steadily about this two visit deductible thing saying it was not complete coverage You yourself said so

SENATOR MURRAY This has nothing to do with avoiding complete coverage This has to do with the regulation which prevents people who may imagine that they want medical care and service when they do not need it at all DR GOIN That I pointed out to you Senator is exactly the reason we have in the voluntary plan not to limit people but to protect the entire plan I think it is definitely necessary in both plans

SENATOR DONNELL I think Senator it should have been mentioned. I am sorry I omitted mentioning it Dr Goin may I ask you just one final question and that is reason 2 that

you mentioned for which the American Medical Association opposed this legislation, that even if the need was soundly established there is no experience to indicate that compulsory health insurance would benefit the public health, although there is some reason to believe that it would lower the health standards Just what do you mean by health standards"? DR. GOIN I think it is fairly well shown that under compulsory health insurance people are sick oftener and longer

SENATOR DONNELL What is the reason for that incidence between the existence of health insurance and these various results? DR GOIN I think that the increasing incidence of sickness is largely due to malingering I think it is interesting to note that in Rhode Island, where they have cash benefits for sickness, the incidence of sickness rises in the summer coincident with the opening of the race track and not in the winter when one would expect to have the colds and pneumonia and so forth It is also interesting to note that in 1923 in Germany, the value of the German money fell to practically nothing I was there and saw it happen And that because it was not worth while to get sick and get the few marks involved the days of sickness as measured by inability to work fell off to one hundred million that year

SENATOR MURRAY Well, Doctor you recognize that there is a difference of opinion among the profession with reference to whether a compulsory system of insurance or a voluntary system of insurance would be the proper system to accept in this country? DR GOIN I do recognize it, with a qualification

SENATOR MURRAY Yes

SENATOR DONNELL Pardon me Were you going to state the qualification? DR GOIN I should like to.

SENATOR MURRAY Yes Go ahead DR GOIN That those who favor compulsory health insurance are very largely people who do not and never have practiced medicine Very largely they are teachers, research workers and so forth

SENATOR MURRAY We had Dr Allan Butler on the witness stand the other day He practices medicine. DR GOIN I do not think so Senator, if you will excuse me I think he is a full time professor

SENATOR MURRAY He testified that he practiced medicine not only in the daytime but in the night time. DR. GOIN Maybe we have got a different definition

SENATOR MURRAY He says he goes to the hospitals and has patients to take care of and apparently is an active practitioner DR GOIN There is no doubt about it but he does not gain his livelihood that way

SENATOR MURRAY Maybe the most of it DR GOIN I think most of it is from the salary at Harvard

SENATOR MURRAY Anyway, he is an outstanding physician and highly qualified? DR GOIN He is an outstanding doctor, there is no question about that.

SENATOR MURRAY Senator Donnell asked him some questions about the opposition to this legislation, and Dr Butler said

> I think the major part of the publicity that is given the medical profession and the lay public reflects a selfish interest in maintaining the interests of doctors who are practicing medicine as they practice it today
>
> SENATOR DONNELL You mean the financial interest?
>
> DR BUTLER Yes sir
>
> SENATOR DONNELL Yet doctor I observe that your conclusion is at page 7 quoting Such legislation as you are considering is imperative if physicians and hospitals are not to suffer financial embarrassment
>
> DR BUTLER That is correct
>
> SENATOR DONNELL In other words as I take it your view is and if I am wrong please correct me your view is that legislation, such as S 1606 will prove advantageous to the medical profession second, that in the absence of such legislation of this type financial embarrassment by the medical profession will generally ensue? Is that correct?
>
> DR BUTLER That is correct
>
> SENATOR DONNELL But in your judgment the medical profession is actuated by what you think are motives of self interest they evidently feel the other way and think that the present situation will prove financially more advantageous than the new system that is correct is it not?
>
> DR BUTLER That is correct and not contradicted.
>
> SENATOR DONNELL Doctor may I ask you this Is it a fact that regardless of the statistics of the number in the Association or out of it, is it not your observation that taken by and large, there is not any more generous whole souled, upright and charitable segment of our citizens than the medical profession as a general proposition? Is that not true?
>
> DR BUTLER That is true Senator but it is equally true that in matters that affect changing the pattern of medical care the bureaucracy that runs the A M A does not permit free discussion
>
> SENATOR DONNELL But the members of the organization have their House of Delegates which meets periodically?
>
> DR BUTLER Yes
>
> SENATOR DONNELL And has it within its power to express the sentiments of the Association any way that the House may want to present that is correct, is it not?
>
> DR BUTLER With the limitation that the boys in power who hold the offices, dominate the committee can to a very considerable extent guide the expression of opinion in the annual meetings and suppress action or opinions that they do not approve of

So apparently there are some men in the profession who do think that there is some basis for feeling that the opposition of the American Medical Association in this matter is somewhat biased DR GOIN Could I make a reply? SENATOR MURRAY Yes DR. GOIN Having all respect for Dr. Butler's very high professional standing, and although I would have the greatest and most admiration for his professional opinion, I think that his statement is sheer nonsense

SENATOR MURRAY Will you tell me, Doctor how the members of the House of Delegates are elected? DR GOIN Yes, because I know it and I do not think Dr Butler did

SENATOR MURRAY Very well DR. GOIN The members of the House of Delegates are elected, as near as may be one half each year by the component state societies My state society in California has a house of delegates Those members are elected by the county medical association and representation is based on population, just as the House of Representatives is here. That body elects delegates to the American Medical Association again on the basis of medical population. Our state has 8 No state has less than 1, regardless of its size Half of these are elected each year, and they are elected for a two year term I am a delegate for the state of California. If the California Medical Association does not like the way I conduct myself it is very easy for it to discharge me As a matter of fact, it discharged all the delegates a year ago put them out of office. I think it is one of the most democratic bodies I have ever seen. It is constituted almost exactly as Congress is. You cannot elect people to serve for a day or two it would be silly As far as the bureaucracy that has control I have not yet come in contact with it. No one has ever told me what I should say or think. I have violently and zealously opposed the American Medical Association on the floor of its House of Delegates Nothing happened to me. I think it is sheer nonsense to say a bureaucracy controls the opinion. Opinions are made by the House of Delegates with perfectly free and open discussion Some one read testimony this morning that these committees are appointed for years There is no such thing They are appointed each session by the Speaker

SENATOR MURRAY As a general rule, the men who appear in the House of Delegates are elected each time they come up for election? DR GOIN I think they change constantly

SENATOR MURRAY Well, if a reputable physician from my state is elected to the House of Delegates he is not displaced? DR GOIN He is apt to be elected two or three times

SENATOR MURRAY I have often met them on trains, traveling to a meeting DR. GOIN That is true of Congress, is it not?

SENATOR MURRAY Men who came to the House of Delegates annually for years DR GOIN I think that is to the advantage of the nation and the American Medical Association.

SENATOR MURRAY I am not criticizing it at all but, as Dr Butler points out, naturally they are conservative. Naturally they are inclined to not be in favor of radical changes in the plan of medical care in this country DR. GOIN Well, I think most of us like most mature Americans are not in favor of radical changes Not just medical care. Change should evolve slowly

SENATOR MURRAY That is true but of course our country has radically changed in the last forty years Forty years ago we were largely an agricultural country, but in the last thirty or forty years we have developed huge industries in certain sections of the country where masses of people are congregated, and sometimes earnings are low and health conditions bad, and they find it difficult to get adequate medical care under the existing system And that is the reason why agitation has developed in the country for some change, and it seems to me that every change which has ever been made in the history of this country for the benefit and welfare of the common people has been met with charges that it is communistic or socialistic or dangerous, and yet when it is enacted the people come to accept it and would not permit anybody even to threaten to change it. That has happened on almost every beneficial measure enacted in our history When it is proposed originally it creates consternation on the part of those who have certain vested interests or feel that they have certain vested rights and they are fearful of the change, and yet they themselves come to recognize it later on as entirely satisfactory DR. GOIN I think that is true but I think it is also true that

during the last thirty years there were a great many radical changes not enacted to our benefit. Not all proposed changes have been enacted into law

SENATOR MURRAY I do not know what radical changes were proposed that were not enacted I cannot think of any that were proposed that failed to be enacted eventually For instance, they had to fight here for ten years to get the Tennessee Valley Authority because vested interests opposed it We had to fight many, many years for an income tax system in the United States That was regarded at one time with great fear and consternation by people in this country and finally we got it Now no one would dare to suggest that it be done away with And the same way with workmen's compensation I remember when I first went west to the mining camps at Butte, Mont, where we have deep mines and accidents occur almost daily Sometimes 100 people are injured or killed or maimed They had no system to take care of those men except by lawsuits, and the lawyers usually exacted 50 per cent of the recovery We have enacted now compensation laws in the country which were bitterly opposed by the medical societies Mr William Green was here yesterday and told the story of the enactment of the workmens compensation laws in the state of Ohio which were bitterly opposed by the medical profession in that state He was a senator in the state of Ohio at the time that legislation was passed They claimed that it was socialistic and very vicious legislation Now it is accepted and is entirely satisfactory to every one

SENATOR DONNELL Mr Chairman may I say one further thing before the doctor leaves the stand Doctor do you consider from your observation and experience that it is practicable for the American Medical Association to develop a satisfactory voluntary nonprofit prepayment insurance plan? DR GOIN Not the American Medical Association but its component state associations I think can and will do so

SENATOR DONNELL You are familiar with the movement that is in process? DR GOIN Yes

SENATOR DONNELL The organization of the corporation recently? DR GOIN Yes

SENATOR DONNELL The matters discussed here by the witness this morning? DR GOIN Yes, I am

SENATOR DONNELL And you regard it as possible for the state associations to work it out? DR. GOIN I do

SENATOR DONNELL Do you think it will be? DR. GOIN I do.

*(Dr Sensenich introduced into the record statements by Joe Howard M D and Mr Say Ketchum)*

### Statement of Victor Johnson, Ph.D , M D , Secretary, Council on Medical Education and Hospitals of the American Medical Association

DR. JOHNSON Unlike my two predecessors I do not practice medicine. My professional career has been in teaching, in medical education and in research My official position in the American Medical Association is that of executive officer, or Secretary, of the Council on Medical Education and Hospitals This council consists of seven national leaders in medical education and hospital matters under the distinguished chairmanship of Dr Ray Lyman Wilbur of California The work of the Council (and earlier, the Committee) on Medical Education and Hospitals in the past century is generally conceded to be a major factor in the high standards of medical and hospital care now obtaining in this country since the quality of a physicians services can be no better than the quality of his education as an undergraduate in medical school and after graduation in a hospital internship or residency After the turn of the century there were increased efforts to improve medical education in this country Some of the medical schools were still operated primarily for the financial profit of the faculty and provided exceedingly inferior instruction. At the instigation of the Council the Carnegie Foundation conducted a survey of medical schools, under the direction of Abraham Flexner and with the collaboration of Council representatives The findings in this survey constituting the classic publication generally known as the 'Flexner Report ' resulted in the closing of a number of the medical schools of the country these were schools scarcely deserving the name producing graduates entirely unqualified to treat the sick. This effect of the Flexner Report is astonishing, since the report carried no legal or governmental authority but produced results entirely through its influence on public opinion

Through the ensuing years to the present time the recommendations of the Council on Medical Education and Hospitals still derive their effectiveness not from legal authority but from public opinion lay and professional which recognizes the objectivity of the conclusions of the Council in its efforts to improve medical education and as a consequence the quality of medical care In carrying out this work the Council, with the approval of the House of Delegates of the American Medical Association, has established standards of education for medical schools and for hospitals offering internship and residency training to medical school graduates, as well as standards for schools in technical fields related to medicine, such as physical therapy, medical record libraries, x-ray, occupational therapy and clinical laboratory work

Annually the Council publishes three special numbers of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION dealing with statistics problems and information on Medical Education, Hospital Care and Medical Licensure, as well as revised lists of medical schools hospitals and other institutions adhering to the high educational standards which have been established These publications are for the guidance of prospective individual students physicians, hospitals, various government agencies and the public.

In my prepared statement I describe a number of publications by the Council which are employed by prospective medical students government agencies and the public and if the committee wishes I can leave for any possible reference it wishes to make to this material these publications for the files of the committee

This work of the Council has been a major factor in warranting the following recently expressed judgments by experts that medical education in this country is unexcelled anywhere in the world and that the low death rate of our armed forces from disease and wounds was due primarily not to plasma penicillin or sulfonamide drugs but to the high quality of the medical education of our medical officers

SENATOR MURRAY I should like to ask you there Doctor, if it is true that the general practitioner of medicine in the United States is a graduate of a recognized college and medical school DR JOHNSON The vast majority of them are

SENATOR MURRAY Very few men are allowed to practice medicine in the United States nowadays who are not really qualified to practice? DR. JOHNSON In two states of the union Illinois and Massachusetts graduates of so-called unapproved medical schools have eligibility for license. It has recently been changed in Massachusetts

SENATOR MURRAY But it still exists in Illinois? DR JOHNSON Illinois yes The school does not adhere to the standards and the graduates are eligible.

SENATOR MURRAY Was that due to a shortage of physicians? DR. JOHNSON That school has been in existence for a number of years certainly since long before the war, so that the war shortage had nothing to do with it.

SENATOR MURRAY But the reason for permitting them to be licensed was the fact that the shortage of physicians made it necessary to undertake to get more doctors licensed to carry on medical practice? DR. JOHNSON I cannot say with certainty what the exact origin of that medical school was, but I do not believe it was a matter of any acute deficiency

SENATOR MURRAY But generally the doctors that are practicing medicine in the United States are qualified? DR JOHNSON Yes generally they are graduates of approved medical schools

SENATOR MURRAY Very well

DR. JOHNSON The legislative measure under consideration deals only briefly in a direct way with medical education and research directly which are inseparable in any sound program. Section 213 provides for 'Grants-In-Aid for Medical Education (and) Research The desirability of such aid has been recognized by the House of Delegates and by the Council on Medical Education and Hospitals of the American Medical Association These bodies have endorsed such federal support provided it is organized and administered soundly as is the case in certain of the proposals now before Congress There are several bills calling for the establishment of a National Science Foundation to administer funds and programs for research and scholarships in the sciences including medicine The administrative arrangements provided by certain of these bills (the Magnuson bill S 1285 and the Kilgore Magnuson bill S 1850) are sounder by far than that of S 1606 and promise greater success in achieving the desired ends than is the case with the measure under consideration The Kilgore-Magnuson bill wisely limits the authority of the director appointed by the President, and places considerable authority in the hands of the members of the foundation who are to be scientists of repute, functioning not simply as advisers to the administrator but possessing the authority to initiate positive action in some instances and to veto the decisions of the administrator in other cases In contrast to this arrangement under S 1606 the Surgeon General of the Public Health Service

required to seek only the advice of the National Advisory Medical Policy Council, which advice he is free to follow or not, as he chooses

Safeguards for the preservation of independence of research workers and institutions are provided in the Kilgore Magnuson bill in a manner which promises effectiveness Such safeguards, which are indispensable for productive research, are almost entirely lacking in the research section of S 1606

In the Kilgore-Magnuson bill the scholarship program is carefully worked out in considerable detail In the bill under consideration virtually no organized program is set forth in the scholarship field

In any program for the extension and improvement of medical care, hospitals occupy a key position, because modern medicine cannot be practiced except with the diagnostic, therapeutic and other facilities which hospitals provide for the use of physicians The Council on Medical Education and Hospitals has long been interested in the number, distribution and quality of hospitals in general Besides the assistance it renders, on request, to hospitals operating educational programs for medical school graduates at the internship and residency levels, the Council also serves hospitals in general in efforts to improve the quality of hospital services This it does by establishing standards of hospital care (as set forth in one of the documents I will submit for your records), providing free consultation services to such hospitals as request them in their efforts to achieve these standards and maintaining a list of "Registered Hospitals" revised annually, which meet these standards

I then quote certain figures which we need not go into unless you wish to know them concerning the number of hospitals, admissions to them, and the bed capacity in the United States

At present about 78 per cent of the bed capacity of this country is in hospitals operated by some government unit, federal, state, county or municipal However, these hospitals, about half of which are for nervous and mental cases, account for only 40 8 per cent of the total hospital admissions Non-governmental hospitals provide only 22 per cent of the hospital beds of the country, but they account for nearly 60 per cent of the patient admissions

Over the years, the increase in hospital beds in this country has been phenomenal, independent of the great wartime increase in the federal hospital bed capacity of the armed forces and the Veterans Administration Hospital beds have multiplied far more rapidly than has the population Hospital beds have tripled in number from 1909 to 1940 The population did not double during those years During that time hospital beds were provided more than one and one-half times as rapidly as the population has grown

The percentage occupancy of hospital beds in the various states displays a phenomenon difficult to interpret If the states are arranged in the order of increasing number of hospital beds per thousand of population we find that this order is also approximately that of increasing percentage of beds occupied in general hospitals That is, the states with the fewest beds per thousand of the population use those beds least, those with most beds use them most For example three states having less than 2 beds per thousand people (in 1940) had an average bed occupancy of 62 per cent sixteen states having 3 to 4 beds per thousand people occupied over 70 per cent of them, while in the District of Columbia with 10 beds per thousand people the occupancy was still higher

Several factors may be involved Perhaps the people in states unable to provide adequate hospital facilities are financially unable to take full advantage of these facilities Perhaps the quality of these hospitals and the means of transportation to them are inferior to those in states with more hospitals However there is probably also the factor of lack of education of the public to the use of such health facilities as do exist This factor must be considered in any program for the improvement of the people's health To be successful, such a program must educate the people to know the health facilities and stimulate their use

There has been much discussion of inadequate distribution of hospital beds especially in rural or economically ill favored areas or states Frequently this inadequacy is expressed in terms of the large number of counties in this country possessing no hospital Such figures present an entirely erroneous picture, since the natural unit is not the county but the trade area, and distance of people's homes from a hospital is more important than artificial boundary lines In 1938 an extensive study by the Council on Medical Education and Hospitals of the American Medical Association revealed that over 98 per cent of the population of the United States lived within 30 miles of a hospital, a distance of rapidly shrinking significance with modern roads and transportation The accompanying map on the next page shows in white all areas within 30 miles of a hospital and in black all areas not within 30 miles of a hospital

In determining these shaded areas such special institutions as mental, maternal, tuberculosis and other restricted hospitals were not considered and hospitals under construction were excluded The shaded areas are almost entirely limited to sparsely settled areas

This distribution picture would be somewhat improved by the hospital construction since that time and considerably improved in the years immediately ahead, since vast programs of hospital construction are contemplated It has been estimated that existing registered hospitals will spend about a billion dollars for expansion, improvement and replacement. The volume of construction of entirely new nongovernmental hospitals is not known but will probably be tremendous

It is recognized that the mere existence of a general hospital within 30 miles does not indicate that hospital facilities are adequate in that area The bed capacity may be inadequate for the population of the area, and the hospital plant and equipment may be inferior and obsolete Recognizing this, the American Medical Association has lent strong support to the Hill-Burton Hospital Survey and Construction Act in actions by its Board of Trustees and House of Delegates and in testimony before two committees of the Congress

In drafting and revising the Hill-Burton bill expert professional advice was sought from a number of qualified organizations An important provision of this measure, which has passed the Senate, is that surveys of existing hospital facilities shall be conducted by the states, and comprehensive plans developed relieving deficiencies in areas needing hospitals and able to maintain them, before federal aid to states for hospital construction will be provided This is an approach to the problem of extending and improving medical care in accordance with the scientific method which should be employed not only in solving medical problems of the cause and control of disease but also in our efforts to evolve programs for providing a high quality of medical and hospital care to all people of this country who need and desire it

SENATOR MURRAY Thank you, Doctor Do you care to ask any questions Senator?

SENATOR DONNELL I do not think so, Mr Chairman

SENATOR MURRAY Thank you, Doctor

### Statement of Dr Walter V Kennedy, President, Indiana Mutual Medical Care, Inc

DR KENNEDY This will be a short and practical expression from personal observations of government control of medicine in England and Germany I have seen the workings in practically all the other continental countries, but because those were the outstanding plans of those two types my remarks are based on those alone

SENATOR MURRAY Do you intend to describe those plans in detail Doctor?

DR KENNEDY I do not, sir I speak from the observations resulting from seeing them It is quite short.

Observation of standards of medical care in continental Europe and the British Isles excluding Russia and Spain between 1904 and 1939, while on nearly yearly visits, is the basis for a definite impression and a considered opinion as to the changes which have occurred since adoption by these countries of some form of direct governmental participation in medical practice The sources of information covered every level of the plans Through the assistance and courtesy of the American diplomatic corps, interviews were had with cabinet ministers with executive and administrative chiefs of health services, with controlling heads of hospitals, with hospital medical personnel, with medical practitioners of the higher ranks and with general practitioners who largely attended to the medical care of the general public and with members of the public in the various economic strata The inquiries were not at the direction of or at the expense of any one else or to establish any preconceived opinion

As trends appeared to develop it became more interesting to verify them and the scope of the inquiries was widened, so that more complete information might be obtained It is desirable to note here that the trends following the introduction of such plans have a close similarity and it has been interesting to observe how sequences might be predicted

It has been noted that the introduction of every plan has been coincident with political needs In no instance to my knowledge have such plans been a considered conclusion of a widely expressed public demand or at the suggestion of the medical profession who ought to be most conversant with need of such plans

All the plans have had an imposing façade of humanitarianism though the ultimate results to the intended beneficiaries have lacked much of the expressed hopes of the originators the actual beneficiencies apparently being in augmented political

power and prestige of the proposers If such plans have value, the social and economic conditions of Europe would appear to offer every likelihood of success

The standards of living in all but the high income classes everywhere in Europe has been low, low to a degree inconceivable to those accustomed to our American standards It might fairly be said that the mass of European population lived on standards equivalent to our near indigent class, which to us represents a relatively small layer And while the near indigent of the European population represents the largest single economic class, they have small opportunity and little inclination to rise economically The American near indigent has every opportunity and because of the American habit of initiative and self dependency, much inclination to rise and this European ingrained acceptance and resignation to the status quo lends itself readily to regimentation and particularly to acceptance of paternalism which always inhibits initiative and progress

The actual living conditions of great masses of Europeans, housing clothing, food, sanitation and amusement have been incredibly bad, and if free or nearly free medical care made available by government was the sole or even principal requirement for solution of the health problem these European medical plans ought have produced greater results than have been apparent. On the contrary, the immediate prewar reports indicated a rising loss by days per year by illness though the trend in the United States without governmental medical plans has been downward

The medical profession believes in good medical care but it also clearly recognizes that without proper sanitation satisfactory housing, adequate food sufficient clothing and reasonable recreation, medical care, no matter how freely available cannot achieve its goals of the highest attainable public health And the notable achievements in betterment of the health of our country now with the highest standards of any land, were accomplished by the American medical profession on its own initiative with its tested and proved methods quite without governmental aid or direction

The question then arises as to relative efficiency of our methods over those of Europe If medical care freely supplied by the government is the method of Europe and yet our progress is decidedly better there seems to be fault in the plan or incompetence in personnel No one will claim that lower standards of medical training are the rule in the European countries Their graduates, who are not participants in medical service plans are recognized in the scientific world as being as competent as our leading men.

Then is it possible that constant participation in the plans lowers efficiency? Long and continued observations have firmly fixed in my own mind that this is true As corroborative evidence let the end result of such service be stated In the original German system the ostensible object was providing medical care for the near indigent at governmental expense No one of ordinary humanity then or now would object It may here be stated that it is even yet as it has been for centuries the privilege as well as the duty of a physician to care for the indigent without expectation of recompense

After the German profession unworthily accepted this plan in succession the higher economic layers demanded under political pressure similar grants from the government. The end after years of gradual encroachment was the inclusion of the entire populations Originally the physicians fee was a reduced one, paid by government with a slight contribution by the public in sickness tax The amount required to supplement the contribution became so onerous to the government that its share became inadequate. Economies were imperative Administrative personnel were political factors and could not have reduced pay The physicians began having reduced partial settlements In time the absurdity of paying 75 per cent and promising 25 per cent was apparent. Then 75 per cent of the original became the standard Later other reductions came Since by this time practically all the population was enrolled in the plan physicians except a tiny number of university professors had no other clientele

The basic necessities of life require a minimum income To attain that minimum the only answer was a greater number of patients There being but twenty-four hours in the day the time allotted to any one was shortened The standard of individual care was dropped There was no other solution In the years prior to the last war Germany became infested with pseudopractitioners of bizarre cults The public health index dropped sharply There were insufficient medical men even for their armed forces with the natural result of decreased military efficiency In this case the lower standards were inducted by the economic faults of the plan.

The English about 1911 as a purely political coup adopted a medical care plan associated with a group of collateral measures Here it was a capitation plan Beginning with income limits around $500, an annual fee of some $225 was paid physicians for full medical coverage of the members of the covered group Patients were assigned to panels of about 1,000 persons At succeeding times and after much conflict, the annual capitation fees were raised to $2 50 and then to $2 75, but also the income limits were increased so that in 1937 over 20 million of their 45 million were included, and, true to form, the current proposal is to include the entire population, to take over all hospitals and their endowments and to make government employees of all physicians who apply

Since there are a very limited number of people able or willing to pay for services outside the plan physicians must lose their individuality and govern their professional relations by prescribed rules, a condition completely destructive of the fundamental need of the use of the untrammeled judgment of the physician for the peculiar and special needs of the individual But for these past years the bulk of the English general practitioners have been compelled by economic need to belong to the government medical plan The plan simply gave the patient license to demand unlimited care domiciliary or office, substituting quantity for quality

There is a fundamental human inclination to demand everything they are entitled to whether really needed or not The result is again overcrowding, superficial examinations erroneous snap diagnosis unnecessary and incorrect treatment, lack of personal interest and from continually repeated habit a lowered standard of medical care which is frankly admitted by many And what is more ominous for the future, the press of over work robs the physician of his required study reading and thought, so that instead of improving efficiency by experience there is a constant deterioration of his ability and what is of basic importance a growing disinclination to be concerned with his patient s welfare

SENATOR MURRAY Doctor might I interrupt you there Those objections could they be urged also against voluntary systems as well as compulsory systems? DR. KENNEDY If the men had to carry the work imposed on them by the state methods they would be

SENATOR MURRAY If a person has insurance and can get service when he wants it, do you think he would be inclined to ask for it when he did not need it? DR KENNEDY There is always that inclination in anything that is made available

SENATOR MURRAY I do not know It may be an inclination to some people Anybody that holds insurance in the United States, and by that I mean life insurance, is entitled to go to the insurance company and get a medical examination I have talked to agents of insurance companies and I have policies in several big insurance companies and I have never applied for a free medical examination The agents told me that they could not understand why more people did not avail themselves of that opportunity Other people carry other policies of insurance that enable them to get examinations and do not avail themselves of that at all I do not understand how it could be said that merely because a person has a right to demand medical service they are going to ask for it regardless of whether they need it or not unless they are mentally affected or cranks on the subject DR KENNEDY So far as the English system and my observations are concerned they do ask for it.

SENATOR MURRAY They do? DR KENNEDY Whether we will in America or not I do not know

SENATOR MURRAY Well I quoted a little while ago a little statement from the British Medical Association in which they state that despite its defects this service has been an undoubted success ' And proposals are now pending over there for an extension of the service They are opposing of course some of the provisions of the extension, but they are in favor of an extension of the service DR KENNEDY I did not get that reaction from the statements made in the London *Times* of March 22 which I have here which carries a full copy of the proposed bill I should be glad to leave it with you if you care to read it, sir

SENATOR MURRAY If you care to leave it I would be glad to have it put in the record I might also ask to have some papers here, taken from THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION in which they discuss the status of the English doctor and wherein communications from British medical men are carried pointing out some of the misunderstandings in this country regarding the English system Doctor do you approve of handling this problem we have in this country by a voluntary system? DR. KENNEDY Yes now

Senator Murray Or do you think we could gradually work out of this situation without any system of any kind DR. KENNEDY I am in favor of a voluntary attempt to meet any

demand, and as such on last Sunday I was elected president of the Indiana Mutual Medical Care, Inc which is intended to offer insurance particularly to those of low income classes

SENATOR MURRAY Well the general objection that has been urged against the voluntary system is that it costs too much, takes a lot of conditions and requirements that prevent the people who most need insurance from being insured and it is not a complete coverage, and therefore it does not cure the problem we have in this country with reference to bringing adequate medical care to the American people That is one of the main objections to it DR KENNEDY We are attempting to find out the costs We nor any one else know exactly what they will be We hope by experimentation to find that out

SENATOR MURRAY Well I just merely called your attention to that Some study has been already made of a number of these societies like the Michigan Medical Service the Group Health Association here in the District of Columbia the Southern Permanente Foundation of Kaiser Corporation in California and the Ross-Loos Clinic in California and each of those societies fails to supply or furnish a complete coverage complete medical and hospital care and other care that the present bill purports to offer to the American people DR KENNEDY That is quite true The American Medical Association has recently approved the formation of an organization of these different plans by which they might set up basic standards and their operations will interchange information s to the costs and possible extensions of service It is a matter relatively in its infancy We will be unable to give definite findings on it until we have had time to work it out.

SENATOR MURRAY You think it might be possible then under a voluntary system to cover the country to such a degree that the cost of complete medical care and hospitalization would be brought within the reach of the American people? DR KENNEDY We hope to

SENATOR MURRAY Well, that is the great problem for us DR KENNEDY Yes sir

SENATOR MURRAY The question is whether or not it can be done by a voluntary system or a compulsory system and we are very glad to have your statement here, Doctor

SENATOR DONNELL Doctor, in England is there a British Medical Association and also an independent branch of physicians independent of the British Medical Association? DR KENNEDY I know of none.

SENATOR DONNELL What I have in mind is this I observe in this copy of the London *Times* that one mention is made here of the "Medical Correspondent"

First thoughts on the Health Bill by the *Lancet* the leading independent weekly medical journal can be summed up as a cautious acceptance of the proposals It points out that the regional scheme for hospitals is not integrated with either the general practitioner service or the local authority health services and it emphasized that the quality of this vast service will depend upon how it is administered.

Do you understand the *Lancet* is a publication of the British Medical Association? DR KENNEDY No it is an independent paper

SENATOR DONNELL Doctor I observe in this copy of the London *Times* that the article appearing in column 7 of page 8 starts this way

Doctors and the Bill Reaction of the B M A

That is the British Medical Association? DR KENNEDY Yes

SENATOR DONNELL (reading)

Views of the scheme

Preliminary objections to proposals in the new Health Bill were put forward yesterday at a press conference held at the British Medical Association s headquarters in London

Dr Charles Hill secretary of the association announced that 56 000 copies of the White Paper would be sent out to members as soon as possible and today a document setting out the considered views of the association would be issued with the full authority of the council Subsequently area meetings of doctors would be held and a special representative meeting of about 250 delegates would be held in London on May 1 and 2 to consider what action should be taken Doctors said Dr Hill would never strike but the profession might decide in the event of their feeling they could not cooperate in the scheme to offer their services to the public as individuals apart from any particular scheme.

Et cetera And then I observe farther down quoting again from Dr Hill

Dr Hill said the association s immediate reaction to the proposals was that they would lead sooner rather than later to doctors becoming whole time salaried servants of the state. That was a form of service they believed to be contrary to the public interest Meetings of members and nonmembers would be called in every part of the country during the first fortnight of April Delegates at the representative meeting while they would not have exactly a mandate would have instructions from their areas

The chairman in reply to questions said that forms for the fighting fund which the association proposed to launch would be sent out immediately They had no idea what would be the response but had already had encouraging signs even some patients asking if they could join it

And I observe somewhat similar language in the *Daily Telegraph* London issued under date of March 22 in which it states

We have no idea what the response will be said Dr Guy Dain chairman of the council yesterday We have had encouraging signs for the fighting fund we propose to launch Even some patients have asked if they could join it.

Et cetera

I would ask that these two articles which are not very long being in the neighborhood of half a column each should be set forth in the record.

SENATOR MURRAY All right It is a pretty heavy record but I believe it is important enough to have anything in the record that any Senator wishes

SENATOR DONNELL I think that is particularly important.

DR KENNEDY In the English case the standards were lowered by overworking primarily and also economic needs as a contributing cause As a logical sequence there appears justice in our claim that governmental plans have not in Europe secured the benefits of improved public health In America, on our own initiative handicapped as well by deficiencies of sanitation, of housing, of food and of recreation we have progressed and with our accustomed methods of proving things, we hope to bring to every American the utmost in good health We approve and solicit governmental aid and support in securing better living conditions and will wholeheartedly support health education wider sanitation better housing and all such measures as may aid in improving the public health and be outside the practice of medicine

SENATOR DONNELL Mr Chairman there is one further question I would like to ask the doctor

Doctor, have you observed what government records doctors are required to keep in Germany and Great Britain? DR KENNEDY I have seen them in Germany, but I have not a very clear recollection of the precise forms I have a rather clear recollection of some of the British forms because I have seen them filled out under rather an amusing system if it had not been so potentially dangerous

A record must be kept by the general practitioner working on the panel system of the case of every applicant and care, together with his illness They occur in books which are made up in columns and those records are inspected at fairly frequent intervals, and if they are not completely made up there are fines applied. I have seen the practitioner repeatedly having the names kept in proper sequence, then fill in from memory the diagnoses which were absurd and the statistics and reports from them were utterly erroneous

SENATOR DONNELL One concluding question Doctor Do you favor all in all S 1606 or are you opposed to it? DR KENNEDY As a whole, or in part?

SENATOR DONNELL As a whole. Well I will put it entirely with respect to the compulsory health insurance feature of it set forth in title II DR. KENNEDY That particular portion of the bill from my experience and beliefs I do object to There are parts of it referring to better sanitation and better medical education and to the establishment of public hospitals for those unable to care for themselves and where the communities cannot do it I am in sympathy with all those aims

SENATOR DONNELL But not the compulsory health insurance? DR. KENNEDY The compulsory health insurance, with its necessary inevitable regimentation of medicine I oppose

SENATOR MURRAY But you would have no objection to the establishment of a voluntary system if it could be made to apply so extensively in the country as to bring down the costs of medical care so that everybody could get access to it? DR. KENNEDY I am heartily in favor of it and actively engaged and interested in the creation of a single facility for doing that.

SENATOR MURRAY I mean to say, would you be interested in some plan the American Medical Association with its vast power and influence, might set up, one voluntary system to cover the whole country and give the people low insurance rates which would enable them to get everything we are seeking to get under this bill? DR. KENNEDY I think that the needs of this vast country are such that it would be difficult to

include within one scheme the needs of every section of the country, so I favor the state organizations, which may be fitted to their particular needs

SENATOR DONNELL Do you believe those state organizations could be so organized and operated on a voluntary prepayment basis as to solve these problems to the extent or better than the government compulsory insurance would solve them? DR. KENNEDY I do so think

SENATOR MURRAY You think they could bring down the cost of medical care to such a degree that it would make it possible for every one in the country to get adequate medical care at a very low cost? DR KENNEDY I believe so I hope so and am engaged in an effort to prove it

*(To be continued)*

# National Health Program

## PLATFORM ADOPTED BY THE AMERICAN MEDICAL ASSOCIATION

***One of the ten points in this platform will be published each week.***

**6 A program for medical care within the American system of individual initiative and freedom of enterprise includes the establishment of voluntary nonprofit prepayment plans for the costs of hospitalization (such as the Blue Cross plans) and voluntary nonprofit prepayment plans for medical care (such as those developed by many state and county medical societies) The principles of such insurance contracts should be acceptable to the Council on Medical Service of the American Medical Association and to the authoritative bodies of state medical associations The evolution of voluntary prepayment insurance against the costs of sickness admits also the utilization of private sickness insurance plans which comply with state regulatory statutes and meet the standards of the Council on Medical Service of the American Medical Association.**

# Washington Letter

*(From a Special Correspondent)*

May 6, 1946

### Support for Voluntary Health Program

Mrs Charles W Sewell of Oterbein, Ind administrative director of the Associated Women of the American Farm Bureau Federation, representing a million U S farm women and their families opposed the Wagner-Murray-Dingell compulsory health insurance bill at hearings of the Senate Education and Labor Committee last week To a question by Chairman Murray she declared that "the voluntary system can supply everything that is necessary in the way of a national health program We would like to be sure that we don't have black markets and things going wrong as in some of these other well intentioned programs I would like to see the voluntary plan tried first ' In her formal statement to the committee Mrs Sewell a convincing witness quoted the resolution passed by the 1945 convention of the American Farm Bureau Federation, which stated "We believe in the extension of the voluntary group prepayment service or some type of insurance plan that provides greater flexibility and would be more likely to succeed over wide areas than a regimented, uniform plan on a compulsory basis" Mrs Sewell endorsed in principle the proposals of the Hill Burton bill, which would 'establish commissions to study health needs and then set up hospitals" During the past weeks testimony Senator Forrest C. Donnell, Republican of Missouri, questioned Secretary of Labor Lewis B Schwellenbach as to whether the cabinet minister had written his own statement endorsing the Wagner-Murray-Dingell bill Mr Schwellenbach said he had received expert assistance from officials of the Children's Bureau and the Bureau of Labor Statistics whereupon Senator Donnell observed that 'this system of endorsing a bill through a statement one didn t prepare and knows nothing about" was 'highly improper" Senator Taft proposes a substitute national health program which would earmark $220,000,000 a year of federal aid to the states to establish a national health agency under the direction of "an outstanding physician" He has termed the Murray-Wagner-Dingell bill "socialistic" Veterans Administrator Bradley asked that the Veterans Administration retain "exclusive jurisdiction" over veterans hospitalization benefits in a national health plan

### Pleas of Nolo Contendere by Sixty-Three Artificial Limb Antitrust Trial Defendants

Sixty-three of the defendants in the artificial limb antitrust trial thirty-three companies and thirty individuals today had changed their pleas of not guilty to pleas of nolo contendere on charges of violating the Sherman Anti-Trust Act. The new plea means that the defendants do not admit but do not contest the charges Federal Judge Bower Broaddus of Oklahoma said that sentences would be passed within a month to six weeks Ten other defendants, seven firms and three individuals, also charged under an indictment returned last November with conspiracy to fix unreasonably high prices on artificial limbs informed the court that they were ready to go to trial and Judge Broaddus set May 9 as the trial date. Counsel for the Association of Artificial Limb Manufacturers of America one of the defendants, said that the group had adopted a resolution authorizing a plea of nolo contendere but that the actual plea would not be made until he gets written authorization

### Washington Hospitals Reported "Worst in Country"

The report of a four months survey conducted by the Metropolitan Health and Hospital Survey has found Washington D C hospital conditions 'the worst which would be encountered in any comparable area in the United States" The three man medical survey board consisted of Drs Claude W Munger, director, St. Luke's Hospital New York Ira V Hiscock professor of public health, Yale University School of Medicine, and C. E. A Winslow, professor emeritus in public health at Yale They declared that present conditions are advisedly described as heart breaking and disgraceful, and they added that the "first and foremost' reason for the intolerable situation is "the fact that nearly a million people inhabiting the District are disfranchised and have no share in their own self government. The system has the serious fault that the real governing bodies have no responsibility to the people who are governed" The report recommended an expenditure of $35 million to improve hospitals in the Capital

### Penicillin to Continue Under Allocation

Despite a 40 per cent increase in production during the first quarter of 1946, penicillin must continue under allocation, it was recently agreed by members of the Penicillin Industry Advisory Committee and the Civilian Production Administration The first quarter production totaled 4 667 33 billion units, equal to about two thirds of the entire 1945 production increasing from 1,306 30 billion units in January to 1 523 02 billion units in February and 1,838 01 billion units in March About 1½ trillion units of penicillin was allocated for May to domestic civilian and export use in parenteral (hypodermic) forms compared with about one half that amount in January

### Cancer Society Drive Extended Into May

Because its goal of $12,000,000 had not been reached by the scheduled April 30 closing the American Cancer Society s drive for $12,000,000 to study the control of cancer has been extended into May, according to Robert I Berger public relations director of the campaign Reports indicate that the halfway mark has been reached. President Truman had designated April as Cancer Control Month

### Medical Progress Reported to Senate Committee

Reports to the Senate Education and Labor committee indicate that malaria can be conquered in five years and tuberculosis, venereal disease and rheumatic fever substantially reduced The reports were based on questionnaires sent by the committee to one hundred and eighty medical, dental, nurses and hospital associations and societies

# Medical Legislation

## MEDICAL BILLS IN CONGRESS

### The Taft-Smith-Ball National Health Bill

Senator Taft Ohio, for himself and Senator Smith New Jersey, and Senator Ball Minnesota, has introduced S 2143 proposing the enactment of the "National Health Act of 1946' The bill was referred to the Senate Committee on Education and Labor It contains three titles Title I would create a National Health Agency to which would be referred designated health activities now carried on by the federal government Title II proposes amendments to the Public Health Service Act to authorize, for a five year period annual appropriations of $200,000 000 for allotments to the states to enable them to provide for general medical service for families and individuals with low income Additional appropriations are proposed to enable the states to provide dental health services for school children and families and individuals with low income Funds would be made available for general medical health research for neuropsychiatric research and for dental research Title III proposes certain amendments to existing laws that would be necessary if the bill is enacted This title also would authorize payroll deductions from the salaries of government employees to facilitate their participation in nonprofit medical, hospital and dental care plans

### Industrial Hygiene

The Senate Committee on Education and Labor has favorably reported S 1271 in an amended form proposing to enact an 'Industrial Safety Act" As originally introduced this bill seemed to provide for a reassignment of industrial health and sanitation programs from health departments to state labor departments As amended according to the report of the committee the bill "eliminates any possibility of such a situation occurring" The committee recognizes, however that if any state wishes to include in the program authorized by the bill features of an industrial health program it is free to do so under the language of the amended bill

### Miscellaneous

A bill introduced by Representative May, Kentucky H R 6305 would make permanent the provisions of the Act of July 11 1941, prohibiting prostitution in the vicinity of military and naval establishments

## STATE LEGISLATION

### Missouri

*Bills Enacted*—S 343 was approved April 25 It provides for the creation of a bipartisan board of six members to be known as the Missouri State Board of Medical Examiners to register and license persons for the practice of medicine, surgery and midwifery and provides for the transfer of records now in the possession of the department of medical licensure of the state board of health of Missouri to the Missouri State Board of Medical Examiners S 434 was approved April 25 Relating to the licensing of midwives, it provides for the transfer to the state board of medical examiners of certain powers heretofore vested in the state department of health S 349 was approved May 3 It provides for the creation and establishment of a department of public health and welfare

### New Jersey

*Bill Enacted*—S 278 has become chapter 259 of the Laws of 1946 It amends the law relating to medical service corporations by providing language purporting "to enable veterans with service connected disabilities to choose their own personal physician and to be treated in local hospitals that have been designated by the Veterans Administration' This quotation is from a statement attached to the bill as introduced

### Rhode Island

*Bill Enacted*—S 266 was approved April 24 It is a joint resolution to revivify the special Rhode Island public health laws survey commission and to appropriate funds to enable the commission to continue its work.

# Council on Medical Service and Public Relations

## PREPAID MEDICAL CARE NEWS

### Progress in Voluntary Prepayment Medical Care Plans

*Seal of Acceptance*

The Council on Medical Service and Public Relations is preparing an interpretation of the "Standards of Approval" as they will be used in granting the "Seal of Acceptance" The details will be made available to all plans interested in making application for approval

Suggestions as to the type of seal that might be used have been received from various sources and will be acted on by the executive committee of the Council this month The favorite to date is a shield outlined in blue, with a caduceus in the center

As a preliminary step for putting the "acceptance" program into operation the following plans have been tentatively approved as meeting the standards of the Council California Physicians Service, Iowa Medical Service, Michigan Medical Service Ohio Medical Indemnity, Oregon Physicians Service, Medical Service Association of Pennsylvania, Medical-Surgical Plan of New Jersey, Nebraska Surgical Plan and Surgical Care, Inc, Kansas City, Mo

Their applications for approval will be formally presented for acceptance at the May meeting of the Council Additional applications will be acted on at the June 28 meeting of the Council

*New Brochure Ready Soon*

An up to date brochure on prepayment plans will be ready soon for distribution It will present factual data on plans An effort has been made to compile the data in such a way as to permit comparison between plans The material will be arranged under the headings of Organization, Governing Bodies, Medical Society Approval, Area Covered, Type of Contract, Income Limits, Enrolment, Benefits, Exclusions Waiting Periods Monthly Premiums, Blue Cross Relationship Change of Employment, Insignia Used and Miscellaneous Provisions

*A Complete File on Plans*

The Council has received almost 100 per cent cooperation from plan executives in setting up a central headquarters for prepayment plan information The files now contain copies of the by-laws contracts agreements, forms and promotional material of nearly every plan In addition statistical data on enrolment, income, payment of claims and administration expense has been compiled and will continue to be gathered at regular intervals

Thirty one states now have voluntary prepayment medical care plans These are Alabama, California, Colorado, Connecticut, Delaware, Florida, Indiana, Iowa, Kansas, Louisiana Massachusetts, Michigan, Missouri, Montana, Nebraska, New Jersey, New Hampshire, New Mexico, New York, North Carolina, North Dakota, Ohio Oklahoma, Oregon, Pennsylvania Texas, Utah, Virginia, Washington, West Virginia and Wisconsin

Seventy-three plans are included in the thirty one states named However, for tabulation purposes the twenty Washington state bureaus and the five Oregon plans might better be set forth as two statewide plans, thus reducing the quoted total to fifty-one plans Twenty three states have only one plan in most cases statewide Four states have two plans each, a statewide plus a local plan, or two plans dividing the state. Three states have three plans One state has five plans and one state has six plans Thirty-four of the plans operate in coordination with Blue Cross Plans

Enrolment in medical society and Blue Cross sponsored or approved plans, as reported on Dec 31, 1945, totaled 2,800 000 This is not an imposing figure but does represent an excellent increase, 114 per cent, over the enrolment of one year ago There were eight plans with a reported increase of over 100 per cent during the year These are Colorado Medical Service,

Dallas County (Texas) Medical Plan Massachusetts Medical Service, Surgical Care, Inc. (Kansas City), Western New York Medical Plan, Inc., Medical Service Association of Pennsylvania, New Hampshire Physicians' Service and Surgical Care (Milwaukee)

The seven plans with a reported enrolment of over 100,000 are, first, Michigan Medical Service with 858,235, second the Washington State Bureaus with 250,000, third Massachusetts Medical Service with 206 729, and, fourth, California Physicians' Service with 202 000 Other plans over the 100,000 mark are United Medical Service (New York), Hospital Savings Association (North Carolina) and Hospital Care Association Inc. (North Carolina)

*Ten Medical Plans Launched in 1945*

The ten medical plans launched in 1945 are the Alabama Hospital Service Association (by rider), Iowa Medical Service, Hospital Service of New Orleans (by rider), Missouri Medical Service (St Louis), Nebraska Surgical Plan, Central New York Medical Plan, Inc (Syracuse) Medical Mutual of Cleveland, Oklahoma Physicians Service, Group Medical & Surgical Service (Dallas, Texas) and Surgical Care, Inc (Roanoke, Va.)

*Ten Plans Set Up So Far in 1946*

The ten plans that have been set up thus far in 1946 are Connecticut Medical Service Florida Medical Service Corp, Mutual Medical Service, Inc, of Indiana, Kansas Physicians' Service, Montana Physicians Service, New Mexico Physicians Service, Northeastern New York Medical Service, Inc, Albany, Ohio Medical Indemnity, Medical Service Bureau of the Utah Medical Association, Inc., and the Wisconsin State Association Plan.

In eight additional states and the District of Columbia plans are in process of formation Arizona, Idaho, Illinois, Maine, Maryland, Minnesota, Rhode Island and Wyoming

*Characteristics*

In speaking of prepayment medical care plans there are two characteristics that separate them from prepayment group practice plans, consumer sponsored plans, private insurance programs and other types of prepayment organizations These are *voluntary free choice of physician* and *control of all medical features by the medical profession* Most of the prepayment plans have been sponsored by county or state medical societies and are operated as nonprofit organizations usually under special enabling legislation

The plans vary widely in some ways and yet, surprisingly enough, are quite similar in their basic characteristics They vary widely in the areas covered There are county plans city plans, area plans and state plans They vary considerably in the benefits provided to subscribers Mostly they provide only in-hospital surgical and obstetric coverage although benefits for x-ray and anesthesia are frequently included A small number of plans include all services medical and surgical, in or out of the hospital A fairly recent benefit which is increasing in popularity is in-hospital medical care. This benefit does not start until after several days have elapsed and continues at a per diem rate for a period of from one to two and a half months

The plans are similar in that all have a free choice of physician and that all are voluntary and with few exceptions include the entire family The principle of allowing subscribers to continue the contract after leaving the group has been generally accepted In such instances the premiums are paid at less frequent intervals, i e. quarterly or semiannually Waiting periods have become fairly well standardized and include from nine to twelve months for maternity cases and one year for tonsillectomies A preexisting condition clause is found in some contracts

The most popular type of plan is a combination service-indemnity plan in which subscribers earning less than a given amount may not be charged an additional fee by the doctors. When the subscribers earnings are more than the stated income limit, the doctor is free to make an additional charge.

A year ago the biggest problem in the prepayment medical care program was stimulating the state and county medical societies to organize specific plans With thirty-one states now having voluntary prepayment medical care plans and nine states with plans in the process of formation, this problem is well on the way to solution The big problem now is to devise ways and means for increasing the enrolment of existing plans While the increase in the enrolment during the past year was over 100 per cent, this still left the total enrolment far short of an imposing figure The emphasis during the remainder of 1946 should be placed on the education of the public to the advantages of enrolling themselves and their families in voluntary prepayment medical care plans

## Coming Medical Meetings

American Medical Association San Francisco July 1 5 Dr George F Lull 535 N Dearborn St Chicago 10 Secretary

American Academy of Tuberculosis Physicians San Francisco June 30 Dr Oscar S Levin P O Box 7011 Denver 6 Colo Secretary

American Association for the Study of Goiter Chicago June 20-23 Dr Thomas C Davison 478 Peachtree St N E. Atlanta 3 Ga Secretary

American Association for the Surgery of Trauma San Antonio Texas June 26 28 Dr Gordon M Morrison 520 Commonwealth Ave Boston Secretary

American Association for Thoracic Surgery Detroit May 29 1 Dr Richard H Meade Jr Kennedy General Hospital Memphis 15 Tenn Secretary

American Association of Genito Urinary Surgeons Stockbridge Mass June 20-22 Dr Charles C Higgins 2020 E 93d St Cleveland 6 Secretary

American Association of Plastic Surgeons Toronto Canada June 3-4 Dr Frederick A Figi 102 Second Ave S W Rochester Minn Secretary

American Association of the History of Medicine Atlantic City May 26-27 Mr W B McDaniel II 19 S 22d St Philadelphia 3 Secretary

American Broncho-Esophagological Association Chicago May 31 Dr Paul H Holinger 700 N Michigan Ave Chicago 11 Secretary

American College of Allergists San Francisco June 28 30 Dr Fred W Wittich 401 LaSalle Medical Bldg Minneapolis 2 Secretary

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATE TO SOCIETY ACTIVITIES NEW HOSPITALS EDUCATION AND PUBLIC HEALTH)

## CALIFORNIA

**New Tuberculosis Head**—Dr Robert J B Anderson, formerly of San Antonio, Texas on loan from the U S Public Health Service, has been appointed chief of the bureau of tuberculosis, California State Department of Health, with headquarters in San Francisco Dr Anderson graduated at the University of Minnesota Medical School, Minneapolis in 1940

**Music During Physical Examination**—According to the *Bulletin* of the San Francisco County Medical Society, the E. T Mape Music Company, exclusive distributors of the "World Music Service" in San Francisco, announce they are expanding their facilities to provide more medical offices with their service To date, two large medical buildings in the city have been wired for the transcribed music. Most physicians find that the music helps relax their patients during medical examinations, Mape officials reported

**Millions for Medical Education**—Legislation has been enacted in California appropriating $7,500,000 to establish a new state university medical school in Los Angeles It is proposed that the new school will be in conjunction with the University of California at Los Angeles The University of Southern California Medical School, Los Angeles, and the College of Medical Evangelists, Loma Linda, are now carrying on undergraduate work The Alumni Association of the University of California and the Los Angeles County Medical Association conducted a dinner March 21 to celebrate the legislative action which assures a new medical school for the city Governor Earle Warren and Assemblyman Davis author of the bill for the medical school were guests at the dinner In San Francisco an expansion program will be carried on at the University of California Medical School under a recent $4,000 000 appropriation The project would include two new large buildings a medical science unit and a modern teaching patient hospital With these additions it is planned to use the present hospital building exclusively for private patients In addition to the recent $4,000,000 appropriation the university will receive about $2,000 000 that had been earmarked in earlier legislative sessions for additional construction and facilities to meet the needs of the medical library and the department of dentistry and pharmacy

## COLORADO

**Ward Darley Dean of Colorado**—Dr Ward Darley Jr Denver, is now dean at the University of Colorado School of Medicine, Denver, and Mr Robert C. Kniffen is superintendent of hospitals Both positions were held by the late Dr Maurice H Rees, who joined the Colorado faculty in 1921 as professor of physiology and pharmacology, becoming dean in 1925 Dr Rees died May 25 1945

**The Jackson Memorial Lecture**—Dr Lawrence T Post professor and head of the department of ophthalmology, Washington University School of Medicine, St Louis delivered the Dr Edward Jackson Memorial Lecture April 19 at the University of Colorado School of Medicine Denver, under the auspices of the Medical Society of the City and County of Denver His subject was 'Changing Eyes in a Changing World

**Rocky Mountain Regional Conference**—On June 5 the first Rocky Mountain Regional Conference on Medical Service and Public Relations will be held at the Shirley-Savoy Hotel, Denver, under the auspices of the Council on Medical Service and Public Relations American Medical Association. Among the speakers will be

Dr James R McVay, Kansas City The Purposes of This Meeting.
Dr George F Lull Chicago Problems of the Returning Medical Officer
J W. Holloway Jr., Chicago, The National Legislative Picture Today
Dr Franklin S Crockett, Lafayette, Ind., How to Keep 'Em Healthy Down on the Farm.
Dr Bradford Murphey Denver What We Expect From the American Medical Association and This Council
Dr Alfred W Adson Rochester Minn. The Council's Big Job
Jay Ketchum Detroit The Progress of Prepayment Plans
Dr Joseph S Lawrence Washington, D C., Results of Senate Committee Hearings on the Wagner-Murray Dingell Bill.
Thomas A Hendricks, Chicago, Public Relations Begin at Home.

There will be a number of round table discussions covering various subjects Participating in the conference will be officers and committeemen of the state medical associations of Colorado Kansas, Montana, Nebraska New Mexico, North Dakota, South Dakota, Utah and Wyoming

## CONNECTICUT

**Personal**—Dr Benjamin Simon has returned from military service to his position as clinical director of the Connecticut State Hospital, Middletown. Dr Harry S Whiting, who has been acting clinical director has been named director of the outpatient service and will be in charge of clinics to be set up in various towns and cities in the district served by the hospital, according to the *Connecticut State Medical Journal*

**Dr Lamoureux Succeeds Millard Knowlton**—Dr Eugene E Lamoureux, Wethersfield, has been appointed director of the bureau of preventable diseases of the Connecticut State Department of Health to succeed Dr Millard Knowlton, Hartford, who is resigning after twenty three years' service Dr Lamoureux graduated at Tufts College Medical School, Boston, in 1935

**Special Committee to Survey Veterans Home and Hospital**—*Governor Raymond E Baldwin has appointed a special* committee to make a survey of the medical service and hospital operation at the Connecticut Veterans Home and Hospital, Rocky Hill Serving on the committee are Drs James C Fox Jr, Hartford, Gerald Klatskin, New Haven, William E. Hall, Meriden and Edward J Ottenheimer, Willimantic Dr Creighton Barker New Haven executive secretary of the Connecticut State Medical Society is chairman of the survey committee Construction is now under way at the Veterans Home to expand the hospital facilities to more than 600 beds

## ILLINOIS

**Advice Sought on Fund Distribution**—*The trustees of* the Swanberg Medical Foundation of the Adams County Medical Society Quincy, would like counsel or suggestions concerning the distribution of a trust fund The foundation was established in 1943 (THE JOURNAL, Feb 5 1944, p 376) by Dr Harold Swanberg, Quincy, and the county medical society as an irrevocable trust. The income of the fund is now more than $600 annually The principal must be held intact, and not to exceed 80 per cent of the income may be expended annually, so the foundation will naturally grow The trustees are empowered to use the funds "to sponsor or undertake one or more things of a charitable, scientific literary or educational nature which will bring public and professional honor and respect to the medical profession.' The board of trustees of the foundation has not determined when the foundation will assume activities or what these activities will be Since they know of no other foundation that has been organized as this one, the trustees

have had no experience to guide them and will therefore be grateful for any suggestions Communications and suggestions should be sent to Dr Ralph McReynolds president, Swanberg Medical Foundation 1101 Main Street, Quincy

## MASSACHUSETTS

**Malignant Tumors of Infancy and Childhood—Organization of a New Consultation Service**—A consultation service has been established to provide assistance in the diagnosis and treatment of tumors of infancy and childhood. This is a further step in the organization of a Children s Cancer Center which is a unit of the new Medical Center for Children in Boston. This is not a tumor registry It is designed rather to give, without charge, immediate diagnostic assistance and advice concerning therapy and prognosis to any doctor who will send the necessary clinical data microscopic sections or x-rays Replies will be given by air mail or when necessary by telephone or telegraph. This project which is supported in part by a grant-in aid from the National Advisory Cancer Council, will be paralleled by a research program concerning the biology of tumors of early life, with a consideration also of the clinical pathologic and epidemiologic aspects of the problem The consultation service will be rendered by a group of three pathologists Drs Simeon B Wolbach Charles F Branch and Sidney Farber and one roentgenologist, Dr Edward D B Neuhauser all of Boston with the cooperation when indicated of the entire staff of the Children s Hospital through the chiefs of the clinical services Doctors representing all the clinical and laboratory specialties concerned with the infant or child will be available for consultation Communications should be sent to Dr Sidney Farber, the Children s Hospital 300 Longwood Avenue Boston 15 beginning August 1

## MINNESOTA

**Resolutions on Medical Care**—The Stearns Benton County Medical Society at its regular meeting April 16 adopted the following resolutions

*Resolved* That we the members of the Stearns-Benton County Medical Society are opposed to the federal plan of medical care as advocated by the Murray Wagner Dingell bill

That we are opposed to the present form of the E M I C program requiring the employment of specialists for almost all types of work.

That we are in full accord with the principle of free choice of physician

That the E M I C requirement constitutes a violation of the principle of the free choice of physician it being our contention that the matter of the necessity of employment of a specialist is the sole right of the patient and his physician and must not be dictated by any program

That the specialist group who comprise the minority of medical practitioners shall not dictate through government or any other agency the form or privilege of practice by the majority who are general practitioners

That we express our approval of the effort being made to establish prepaid medical and surgical service in Minnesota and throughout the United States by the American Medical Association

That we present these resolutions as an expression of the larger majority of physicians throughout the United States who are not specialists but general practitioners

That each county society in the state and the state medical association be circularized with these resolutions and that our delegates be instructed to present them at the state meeting in May for action by the state society

## NEW YORK

**Society Observes One Hundred and Fortieth Anniversary**—The Richmond County Medical Society recently held a special program to commemorate its 140th anniversary The society was created by an act of the state legislature on April 4 1806 The first meeting was held July 1 but no business was transacted in the absence of a quorum The first officers were chosen at the second meeting July 10 but July 17 was later designated as the official anniversary The names of the first officers were Benjamin Parker president Richard Henderson vice president I B Halsey secretary, and Isaac Stuart treasurer

**Name Changed for Malignant Diseases Institute**—On April 1 the name of the State Institute for the Study of Malignant Diseases Buffalo was officially changed to the Roswell Park Memorial Institute. Dr Louis C. Kress who has been director of the institute since Sept. 1 1945 will continue in charge of the project. He was formerly director of the state division of cancer control The change in name was advocated in senate bill 341 One of the reasons for the change is that it has been found that many persons are deterred from seeking treatment at the institute because of the word malignant in its title, and physicians have been reluctant to send persons

there because they did not wish to frighten their patients when they suspected a diagnosis of malignant disease but were uncertain Another reason is the wish to honor Dr Roswell Park who while professor of surgery at the University of Buffalo School of Medicine, was influential in obtaining an appropriation from the state to establish what was known as the New York State Pathological Laboratory of the University of Buffalo in 1898 becoming its first director (THE JOURNAL, March 16, p 726)

## GENERAL

**Louis Neff Goes to Texas**—Mr J Louis Neff has resigned as executive director of the American Cancer Society New York to become executive director of the newly organized Texas division of the society with headquarters in Houston

The many requests to the commission for copies of the booklet stemmed from a Current Comment in THE JOURNAL, February 23 page 498

**Courtney Smith Named Medical Director of Red Cross**—Dr Courtney M Smith, acting medical director of the American Red Cross, Washington headquarters has been appointed administrator, medical services (national medical director) to succeed Dr G Foard McGinnes who was recently appointed vice chairman for health services a newly created position (THE JOURNAL March 23, p 806) Dr Smith has served with the Red Cross since 1944 as deputy medical director and director of disaster medical service He graduated at the University of Oregon Medical School, Portland in 1933 and later received the degree of doctor of public health at Yale University His subsequent activities include service as health officer for the Territorial Department of Health of Alaska with headquarters in Juneau, and from April 1942 until his Red Cross appointment Dr Smith was a medical officer in the Office of Civilian Defense In May 1945 he was given leave from the Red Cross to represent the U S Public Health Service with the Army's Strategic Bombing Survey and did a tour month tour of duty in Germany

**Poliomyelitis Preparedness Program**—The 1946 poliomyelitis preparedness program of the National Foundation for Infantile Paralysis revolves around a series of conferences with health officials scheduled for fifteen states throughout the nation The conferences are being called in cooperation with state health commissioners to determine and evaluate health services and plans of action before onset of the epidemic season late in June Participating will be state and county health officials, directors of crippled children s services, physicians nurses hospital administrators, epidemiologists and representatives of the National Foundation and its chapters The meetings which opened in Florida April 27 will be held in Ohio June 13 14, in Colorado and Wyoming June 17-18 and in Alabama Louisiana, Illinois Mississippi, Pennsylvania, Georgia, Missouri, Arkansas Montana, South Carolina and Oregon. In other phases of the poliomyelitis preparedness program the National Foundation has established four epidemic aid units for duty wherever infantile paralysis strikes and is seeking to double enrolment in its poliomyelitis emergency volunteers, an organization of women trained to assist physicians, nurses and physical therapists in caring for victims of the disease The foundation has also completed a mobile emergency poliomyelitis unit capable of reaching in twelve hours or less any epidemic area within 600 miles of its base In the field of long term preparedness the foundation has allocated $800,000 for establishment of seven more professional level training and treatment centers similar to the poliomyelitis unit set up at Knickerbocker Hospital in New York City last fall and has appropriated $1,516 530 for fellowships, scholarships and training program development in physical therapy Another $1,527,700 has been granted thus far this year for research and education in poliomyelitis and related fields, bringing to $11,071,962.34 the total appropriated in this sphere since the foundation was created in 1938, in addition to research the foundation spent $1,602,456 last year to supplement $5,000,000 expended by its nearly three thousand chapters for actual care and treatment of infantile paralysis patients Funds are provided by the annual March of Dimes

**Ex-Convict Wanted for Practicing Medicine Without a License**—In the hope that he may be apprehended the St. Louis Police Department has issued a warning concerning one John Waite, alias John V Waite, alias Dr Waite, alias Tommaso Armonia, alias Paul Pareant, alias Raoul Armonia alias Jerome Wayte, alias R Jacques Waite was arrested on a charge of practicing medicine without a license. After a warrant had been issued on the same charge Waite was released on bond Feb 10 1944 which he later forfeited Investigations prior and subsequent to Waite s arrest indicate that he is the same person who was arrested in 1916 in Connecticut for obtaining money by false pretense and indecent assault, in New York for illegal transporting of automobiles, in New Jersey and Maryland for false pretense and in Pennsylvania for conspiracy A number of indictments are charged to him as well as sentences in penal institutions According to the description his age is 60, height 5 feet 7 inches, weight 126 pounds He has a slender build blue eyes, medium chestnut hair and swarthy complexion. In St Louis Waite was reported to be apparently the manager of the Civic Medical Center on whose staff there appear to be

Wanted—illegal practitioner

legally licensed physicians He had set himself up however as a 'doctor and had prescribed drugs and had given injections on occasion Evidence discloses numerous dishonest activities in this person s life Some information indicates that Waite under the alias Tommaso Armonia, was operating under the credentials of a deceased physician. Any one coming across a person who fills the description and general makeup of this so-called impostor should communicate with local police authorities who in turn are requested to notify the St Louis Department of Police.

**Association of Industrial Physicians and Surgeons**—A meeting of the Western Association of Industrial Physicians and Surgeons will be held June 30 in the San Francisco Health Auditorium, San Francisco under the presidency of Dr Richard O Schofield Sacramento, Calif Among the speakers will be

Dr Walter R MacLaren Burbank Calif and Albert L Chaney Ph D Los Angeles Evaluation of the Factors Tending Toward Permanent Occupational Deafness
Dr John W C Hannon, Washington Pa The Utilization of Aluminum in the Prevention and Treatment of Silicosis
Dr Waldemar C J Dreessen Bethesda Md Laboratory Procedures to Which the Industrial Physician Should Resort for a Better Diagnosis
Dr Joseph H Boyes Los Angeles The Immediate versus the Delayed Repair of the Digital Tendons
Dr Douglas D Toffelmier Oakland, Calif Reconstruction of the Amputated Stump for Weight Bearing
Dr Oscar A Sander Milwaukee The Pneumonoconioses—Their Differential Diagnosis and Prognosis
Dr Hedwig S Kuhn, Hammond Ind Right Eyes for the Job

A symposium on the Worker and His Job, with Bert Hanman Berkeley, Calif., as chairman will be presented by the following principal speakers Dr Henry H Kessler, Newark, N J, Edwin E Ghiselli Ph.D, Berkeley Dr Karl M Bowman San Francisco, and W F Durant, D Eng., San Francisco A group of experts will discuss the following aspects in

the symposium personnel, veteran rehabilitation, civilian rehabilitation, government employment, industrial safety workmen's compensation, public health education insurance, industrial hygiene, labor and management

**Bulletin of Friends of Medical Research**—Recently publication was started of a *Bulletin* of Friends of Medical Research, a newly formed national organization to oppose groups that are against animal experimentation The *Bulletin* is devoted to comments on legislation concerning this type of research as well as discussions of various lay and medical activities carried on in this field The National Society for Medical Research has been organized under the auspices of the Association of American Medical Colleges Its offices are at 303 East Chicago Avenue Chicago 11 and Anton J Carlson, Ph D, and Dr Andrew C Ivy, both of Chicago are president and secretary-treasurer respectively This group will be an educational organization to determine policies to analyze and select the basic scientific material and to organize local groups of physicians and scientists for educational campaigns where animal experimentation legislation is proposed. Affiliated with it will be the national organization of Friends of Medical Research, whose function will be to obtain the cooperation of lay groups on the state level and to organize and conduct legislative campaigns Offices of the Friends of Medical Research are located at 292 Madison Avenue, New York 17

**Science Writers Honored**—The first presentation of the George A Westinghouse Science Writing Awards took place in St Louis during the meeting of the American Association for the Advancement of Science March 27-31 The science writers receiving the awards which consisted of medals and citations include Watson Davis Frank Thone, Jane Stafford and Marjorie Van de Water, all of Science Service, Howard W Blakeslee, Associated Press David Dietz, Scripps-Howard Newspapers Thomas R Henry, Washington *Star* Waldemar Kaempffert New York *Times* Gobind Behari Lal *American Weekly* William L Laurence, New York *Times* Herbert B Nichols *Christian Science Monitor*, John J O Neill, New York *Herald Tribune* and Robert D Potter, *American Weekly* The fund used for the awards was provided by the Westinghouse Educational Foundation and is administered by the American Association for the Advancement of Science to develop closer cooperation between scientists and news writers in keeping the public informed of scientific developments which more and more affect human lives "in this atomic age (THE JOURNAL, February 2, p 298) At the time the science awards were created, the establishment of an annual $1 000 prize to a newspaper writer for outstanding science reporting of the year was also announced. The first recipient for this award will be reported during the meeting of the American Association for the Advancement of Science in Boston in December

### Problem of Neurotic Ex-Soldiers

The Ministry of Health has had an investigation made to discover how men discharged from the army on account of neurosis readjust themselves to civilian life. The investigation was carried out by Dr Eric Guttman of the Mill Hill Emergency Hospital and Miss Elsie L Thomas, a psychiatric social worker The investigation covered 382 selected cases chosen on an area basis representing industrial and rural districts exposed to enemy attack, including one heavily bombed city The investigation was limited to discharges in the three months that began on Jan 1, 1943 The following are the main conclusions

Men discharged because of neurosis have considerable difficulty in readjusting to civil life and even fifteen months after discharge have a high incidence of neurotic complaints and illness The majority find it difficult to return to employment, as shown by delay in starting work and a high rate of absenteeism Some are unhappy in their private lives, self conscious and liable to social frictions However, more than 200 still held the same job taken on leaving the army, while another 80, after a false start, had settled down to their second job Married men changed their jobs less frequently than bachelors In many cases the men themselves or their relatives reported that their avocations had changed, that they had become less sociable, less interested and less active. Three fourths of the group had definite neurotic traits before enlistment, and more than half complained of physical ill health before joining the army

The authors conclude that the critical time in readjustment to civil life is the early period after discharge The better provision now made for discharged men by the Disabled Persons (Employment) Act and the newly organized Board of Control for mental disease will result in better treatment and advice and thus enable men to return to work earlier The return of psychiatrists from the services should provide increased facilities for outpatient treatment

### The Bread Question
